Vol. II. No. 1.
NO 508 MONTGOMERY STREET. SAN FRANCISCO, SATURDAY, JANUARY 6, 1883. SUBSCRIPTION FIVE DOLLARS A YEAR.

MR. W. H. VANDERBILT'S STABLE.

Description of Inmates—Aldine's Deceiving Appearance, Etc.

We alighted at the stable, corner of Fifty-second street and Madison avenue, and while Dan wes hitching the horse, I made an external survey. It is not of imposing appearance, but a cosy, solid-looking, two story pressed hrick and brown stone huilding, with gables and slated roof, fronting 75 feet on Fifty-second street, aud extending 100 feet on Madison avenue. I afterwards learned that its construction hegan in 1879, and it was finished in October, 1880, at a cost of ahout $60,000, and the lot on which it stands is valued at a like amount. The entrances are on Fifty-second street. Ringing the office door-hell, we were nshered into a small reception room, from which we passed ont into a spacious epartment, and there met Mr. Phelps, the foreman, who had just bronght in Small Hopes from exercise to a road-cart. He mentioned that this was the first time the outlaw had been in harness eince laet spring, as he had been enjoying a summer's run at pasture, which has done him good, and added, "he is now ae limher and playful as a colt." "Yes," said Dan, "he onght to have had euch a let-up three years ago, after so much faet work on the road. "Hello, William." "How are ye, Mr. Mace?" wae the exchange of greetings, as old William, the famous groom of the late Commodore, and still a retainer of the family, came forward to unharness his charge, Small Hopes. Dan says, aside to me, "William 'heeled' Small Hopes and Lady Mac when they went in 2:22."

After Small Hopes was removed to his box, we turned our attention to the appearance of the room. Immediately npon entering the large front door to the right is a large oil painting of Judge Fullerton in motion, with Dan Mece in the sulky, painted by an amateur, Mr. Geo. Singerly of Philadelphia. The nakedness of the large ash wall on the left is coveren by a set of Fox's pictures illustrative of English hnnting scenes, and in the center of the gronp is a life-like portrait of Maud S, surmounted by a picture of Small Hopes and Lady Mac, as they appeared when driven hy Mr. Vanderbilt in 2:23. The space on this side of the room is occnpied hy the family carriages, consisting of fonr french and two Brewster vehicle of elegant design and workmanship. Then facing yon as you enter is the harness room, furnished with large plate glass cases, filled with a fine display of harnesses, from the most magnificent etyles of English harness to the lightest eingle and double American trotting horse gear.

In a convenient epace, at the entrance to the harness room, there is a nnique case for bits of various kinds, which are displayed on hlack velvet heck ground, as if to invite particular attention. Before leaving this room I noticed an interesting gem, a flat carved figure of Mand S and her four-year-old time, 2:17½, emhossed on a velvet surface, all of which ie the work of a little girl, an admirer of the Queen. Mr. V. has had it encased in a neat frame, and values it more highly than many a racing trophy. From this room there is easy access, by sliding doors, to the inclosed walking ring, which ie covered by a glass dome. The track is ahout six feet wide and covered with tan hark; the center of the room is laid with large slabs of smooth gray stone, on which are ranged a number of light Brewster wagons, for speed and road driving, also eome speeding eleighs. There is egress, by sliding doors, from this exerciеing track to the stahle proper, which facee on Madieon Avenue. Maud S's stall fills the space 18 by 24, north of the doors. It and the other stalls are heautifully finiehed with artistically selected oak and walnut trimmings, and pine floors. The ceiling and the working room of the stahle ie covered with hard polished wood. The stahle utensila are strongly mounted with hrass trimmin In a word, the appointments are complete, and the three great requisites of light, ventilation, and sanitary arrangements are perfect.

There are ten hoxes and six open stalls on the premises: the open stalls and four of the boxes are ranged in a row along the Madison avenne wall of the stable. Two of the boxes belong to Leander and Lysander, the other two are the apartments of the redouhtable pair Aldine and Early Rose, hut at present the Rose is keeping Mand S's home warm, ehe being domiciled in the Queen's box. Six carriage horsee, in excellent condition, every one of them fully 16 hands high, were standing quietly in the open stalls.

"Take care," said Dan, as Mr. Phelps removed his hlanket; "he is liable to lnnge out, as he has got a hit of temper when a stranger comes aronnd."

"Just like his sire," was my answer; "I've had the old horse in my stable, and this fellow reminds me of him, except that the Chief was smaller."

"Leander is a great horse tbis fall," broke in Mr. Phelps. "You can see there isn't a pimple on him, except the slight wind puffs on his forward ankles, and his legs don't stock. We haven't got a horse that stocks, as we look closely to their general health."

"There's a horse, if they will go the length of the road (meaning two miles from Macomb's Bridge to Central Park) with him, can heat ahout all of them," said Dan, as we took leave of him.

Leander is a dark chestnnt gelding, foaled 1870, hred in Michigan, and got by Marshall Chief. He is about 15½ hands, a long-hodied horse, higher at the hips than at the withers, a smoothly-turned one, whose appearance indicates a comhination of Morgan and thoroughbred hlood. His record of 2:24 was made in 1878, on a half-mile track at Norwalk, O., and I have heard on good authority that he showed 2:18 over the same track. His turf name was Dr. Lewis, and he masqneraded "down East," in 1875, under the name of Flexible.

Mr. Vanderhilt is driving him hoth single and donble this winter. He is a very stylish going horse, and gets his head a trifle higher than Lysander when he hears the crowd coming.

The next hox was vacant, as Lyeander was standing on the main floor, attached to a light, half-seat top-wagon, ready for Mr. Vanderbilt to take his afternoon constitutional, and we examined him there. He, too, is a dark chestnnt, about 15.1, and is best descrihed in Dan's words: "Here's an Ethan-Allen shaped aad gaited trotter, good feet and legs, a remarkably sound little horse for one that has done so mnch fast work, single and double. A good breaker single, bnt apt to lose three or fonr lengths when he breaks to the pole. A free, steady-going driver, and, althongh a Hambletonian, I never fonnd a Hambletonian trait in him."

"You've judged him correctly in comparing him to old Ethan, as his dam was a Black Hawk and a granddaughter of Ethan's sire, so he takes after the materual line. His sire is Lysander, eon of Hamhletonian—"

"There's nothing like a dash of Morgan blood to make tough, enduring and stylish roadsters," remarked Dan as we took a parting look at Lysander.

He, too, was foaled in 1870, and, as Lysander Boy, made his harness record, 2:20¾, at Buffalo the eame year that Leander scored his. As is well known he gained a record of 2:20 to the pole, with Wm. H in 1881. I may here mention that Wm. H was attacked by a fatal and painful disease last summer, and was shot to end his misery.

"Be good enough to show me Small Hopes next, Mr. Phelps."

"This way, please," said he, as he opeued the door of a single loose box, to the right of the entrance from the carriage and harness rooms to the stable. "Wh-ho, me boy," said William soothingly, as he was giving him a light eoak out after his exercise. The old man threw the blanket np and dieclosed the same evenly proportioned, stoutly-built, medium-sized browu trotting gelding that years ago nobody, in the Far West, could get any intelligence of until, under the name of Lothair, he gave them reason to remember him, and in the East, as Laplaud aud Westbrook, he was always in the vau when his driver, Wm. McGuigan Jr, pleased.

Small Hopes was foaled in 1866, and got by Hamhletonian, dam believed to he a Morgan. His harness record, 2:26½, was made in 1875 at Omaha, Neb., under the name of Lothair, hnt his greatest public performance was made in 1877, when he and Lady Mec trotted to the pole in 2:23, driven by Mr. Vanderhilt. He is evidently in an indnlgent master's hands, for his years sit lightly on him, and it ie confidently expected that, after a careful winter's jogging, he will act as mnch like a trotter as ever he did in his life. Mr. Vanderbilt will drive him to the pole with Lysander next spring.

We next crossed over to the row opposite, and in the box adjoining Lysander's took a look at Aldine. Although I had seen her in all her races throngh the Grand Circuit, except one, I did not recognize her at first sight. She is one of the kind that looks her best in motion. A long-necked and rather ronghly-huilt mare, which is more apparent as she carries little flesh and is a mass of sinew, bone and mnscle, looks high on the withers, hut with the Almont characteristic of powerful propelling power hehind. She is 15¾ hands, a brown, with near ankle white and star in the forehead, foaled 1873, and won a three-year-old stake at the Breeders' Centennial meeting, hut has done nothing sensational since then nntil the past season, when she won an nnbroken chain of victories from Cleveland to Hartford without a hreak save in one heat. Her lest race was the fastest, 2:20½, 2:19¼, 2:19¼, and P. V. Johnston, her late driver, said:

"I have the best of reesons for believing that the correct time of that race was 2:20¼, 2:19, 2:19, 2:18¾. She was, without exception, the easiest horse to drive that I ever pnlled a line over,"

Dan Mace remarked, "This mare may not stand so much grief, and smile at it, as Early Rose, hut from what I saw of her at Hartford, going away from the wire a eixteen clip, outside a field of fast ones, and finishing as steady aud stroug-going as she did, I think a great deal of her."

"May I examine her feet and legs, that they say are iu such bad ehape?"

"Certainly," replied Mr. Phelps.

I therenpon picked np her feet, found them free from fever, a good healthy growth goiug on and all souud, except a quarter crack, which has grown down nearly two inches. She has rare good legs, hard as iron, except (if I remember correctly, for I took no descriptive notes) the near hind one, which is somewhat filled up, hut on passing my hand down it I found no indication of straiu or rupture. I learu the enlargement was occasioned by striking a sulky wheel in a collision when ehe was a colt. She goes on the off side as a mate to Early Rose.

"Great mare this, sir," observed her attendant, as I lingered behind while Mr. Phelps had gone forward to remove the clothing from Early Rose. "She's as steady as a clock, nothing hothers her; you'd hardly helieve she was clipping the whcel of the skeleton when she trotted in '16½ at Hartford."

Before I went to look at Early Rose, I stopped for a few moments to glance at Bay Dick, record 2:29½, sired by Houser's Hiatoga, and hred in Ohio. I've seen him in many races. Thero is nothing very striking in his appearanco, hut he is a ehowy trotter and prompt road horse, who cau certainly speed fast, and the pole work seems to he hie forte.

Our last survey was of Early Roee. She is a picture of strength and symmetry, as she stands without a blemish or fault in the perfection of condition. Her coat eleek as satin, broad, flat legs, with plenty of bone below the knee, feet of deer-horn texture, and heels that defy coutraction. There are no flaws to be detected iu Early Rose. I believe she ie the same age as Aldine, or possibly a year younger. Both are by Almont, and there is quite a family likeness, particularly when they are moving together. The same evenness of stride and carriage of head aud hody are plainly [illegible].
—*New York Spirit.*

THE PADDOCK.

Horses for Farm Work.

A veterinary anthority has recently given utterauce to the impressive statement that, despite all the progress which has been made in the use of steam and electricity, yet, if we take the horse from human service, the greater part of the world would relapse into harbarism. The remark is undoubtedly correct, and if there were any skepticism as to its truth the dependence of farm work on the labor of the patient horse would attest its correctness. Steam has superseded horse labor in thrashing and some other farm operations, but, for the most part, the plowing, cultivating and harvesting are still performed by horse labor. It goes without saying, that upon the kind of horse kept and upon the management bestowed by the owner depend the farmer's success. The difference, in this connection, is greater than in almost any other kind of stock. A good team of horses is worth through the year nearly as much as the labor of an able-bodied man during the same period. Under proper conditions, wherehy a pair of horses are enabled to perform a good day's labor every working day in the year, this labor is worth much more than the product of the same feed given to any other kind of stock. The labor of the hired man has to be paid for, besides his board and clothing. The team has only to be fed, while its only clothing is a set of shoes and the addition of blankets in extreme cold weather. If a due proportion of young horses is kept on the farm the depreciation in value from year to year will be very slight. A good farmer, who is an excellent judge of horses, makes a practice of buying two and three-year-old colts. The first and second years they more than pay their way; when five and six years old they are at their prime, and he generally sells at seven, before they begin to fail and when they bring the highest price they will ever fetch. With a little care in selecting a matched mate, horses six or seven years old can often be sold at fancy prices to rich men in large cities anxious for a fine team and regardless of cost.

A mistake frequently made by farmers is in keeping too many and too poor horses. The cost of feeding a horse during twelve months is usually half the value of a good one, and sometimes more than the valne of a poor one. From this cost may be deducted the manure, but at the best it will be seen that a horse must be kept at work most of the time through the year, or he will very soon eat his head off. A strong team of young horses weighing 1,250 pounds each will cost for keeping during the year nearly or quite $200. There are 312 working days in the year, and if the farmer is able to put these horses at profitable work for 300 of these days he can well afford this expense. At some seasons team work has a greater valne than at others, being worth as high as $1 50 or $2 a day in the hurry of plowing and harvesting. Throngh the year, however, the team should average $1 per day in earnings to offset its keep, leaving a profit of $100, less deterioration in value and risk of accident. Many farmers on small farms keep two horses, when they have really profitable work for such a team not more than two or three weeks out of the fifty-two. Worse still is the case of larger farmers, who keep six to eight horses through the year and a great deal of the time have nothing in productive work for any of them to do. Many failures of farmers are due to this cause. Such individuals will easily recognize the mistake in hiring a lot of men and leaving them idle half the time, but in proportion to their work the feed of well-kept horses is as costly as the wages and board of a hired man.

An equal and quite as common a mistake is the keeping of horses too poor in quality and too low in condition. A team is not employed to work alone, and hence an inferior team not able to do a full day's work also diminishes the economical value of the labor employed in connection with it. In the hurrying season of plowing and harvesting the efficiency of the team help is often the most important factor in securing a profitable result. With two strong horses that will plow two acres in a long spring day, the cost of fitting the ground is reduced to a minimum. Very often a single day's delay in fitting the ground will make more than a week's difference in seeding, besides usually involving extra expense in refitting and often lessening the crop in the end. It is not profitable for farmers to keep horses for fancy points, but the points which make them effective for farm use are not fancy, and when all are combined in a young, well-broken team, quiet and easily handled and able to do any kind of work, it is hard to estimate their value. A practical farmer remarked of his span of five-year-olds that he would not take $600 for them. When told that this was a fancy valuation, he replied: "Not at all. I know those horses to be sound and every way true. I can use them fifteen years with due care, and their cost during that period over and above the market price of poor horses will not average $25 a year. With such a team I can do nearly all the work on my farm. The horses are able to work as many days as I can during the year. I cannot afford to run my farm without these horses, or another pair like them, which I should not know where to find." This is a sensible view of a practical farmer and shows a working value for good horses that makes it an object for farmers to breed their own teams.

Size is an important consideration in the farm horse, especially in very heavy, stony or hilly land. In drawing loads up hill, weight in the horse is quite as important as muscle. A light horse put to work beyond his strength soon wears out, and is only a bill of expense until disposed of. The desire for fast horses on the road has led to the breeding of lighter stock than is generally desirable for farm uses. But this fashion is now giving way, as the cost of keeping these light horses is very nearly as great as that of the heavier animals. Their nervousness and excitability make them especially liable to accidents and disease, particularly if put to work for which their lighter build unfits them.—*American Cultivator.*

BREAKING COLTS.—Colt breaking should begin at the birth of the colt, because he then instinctively shows his fear or timidity of man, which should be then completely dissipated. This is a singular fact. The young calf, or the dog, or any other of the domestic animals betray no such positive fear at birth. But the dam, no matter how gentle she may have been as a favorite horse for years, as well as the colt itself, will endeavor to elude the caresses of man as soon as the colt has strength enough to use its limbs. He is a wise colt breaker who loses no time in overcoming this timidity. Some breeders have adopted the practice of having their most valuable brood mares drop their foals in a large paddock, so that they can handle the foals, and at once disarm them of their instinctive fear of man. This can be so successfully done, in a few days, that the colt in the open field, and when he grows up to mature horsehood, will never fail to come up to his owner, or even to strangers in the field, for their caress. The colt is naturally suspicious but when that is overcome, then his affectionate confidence has no limit. Every thoughtful colt breaker, therefore, will use his sagacity to accomplish this result by considerate kindness to the colts under his tuition.—*National Live Stock Journal, Chicago.*

Mange.

By mange we understand the presence of a cutaneous affection, in which there is great itching of the skin, with scabbiness of the epidermis, falling off of the hairs, etc. This itching is caused by the presence of minute animals called *acari*. Mange in the horse is of a similar nature to itch in man, and to mange in the ox and dog, and scab in sheep. Mange seldom affects the well-cared-for and well-groomed horse, but is principally confined to the rough, half-starved animal, although, of course, it is met with in every horse, but more frequently in the latter class. Inveterate mange is marked by the presence of bare white patches on various parts of the skin, but generally on the thinnest, most muscular and most sensitive. From these the cuticle scales off, leaving the true skin bare and unprotected, and at first red, arising from an extravasation of blood. After a while, however, the true skin throws out a morbid secretion which exsiccates—that is, forms a scab over the spot. The skin has an arid, cracked kind of feel, and in places, particularly in the sides of the neck, is thrown into wrinkles. The other parts which are not denuded of hair seem to have a greater or less tendency to take on a morbid condition; the hair has an unnaturally rough, harsh feel, and in places may be plucked out in bunches. The scaled or detached cuticle, the red spots, and the ease with which the hair leaves the follicles, may be regarded as significant of mange. In the early stages an examination may detect the presence of small pimples; these resolve themselves into vesicles, which burst and leave a red spot behind. These pimples exist in great numbers in some parts, where the skin is thin, and are so numerous that when they break and run into each other, they form a large bare patch, which becomes covered by a white morbid cuticle. Perhaps the first symptom of mange is an itching at the roots of the hairs of the mane and tail, with a scabby condition of the cuticle, which gives the horse pleasure to have scratched. We often see horses with their hair ruffled from rubbing, and sometimes quite worn down to the roots, but no pimples, or vesicles, or abrasions of the true skin, and the hair still adhering firmly by its roots. This is not mange, but is a result of what in vulgar parlance is called "beat of the blood," or, in medical phraseology, constitutional excitement. It requires, therefore, mere sedative treatment. If it be mange, the disease will rapidly spread, and present the appearance which we have described above. The hair does not seem to be affected until secondarily, for the coat does not come off until some time after the disease has commenced.

Among the causes of mange, contagion must certainly be classed. It is decidedly the most general cause, and it is remarkable how very easily it can be conveyed from one horse to another; the merest touch, as it were, of either the animal affected or the harness which he has been wearing, etc., and it may almost be said that the disease will be produced. It is decidedly, if not the most contagious disease, certainly one of the most which affects the horse, or indeed the greater part of our other domestic animals. But there are other causes besides this, although they are by no means so frequent as they have been, their less frequent occurrence being due in a great measure to the advances of veterinary science, and the greater care which is now-a-days bestowed on the horse. We allude to bad management in the shape of improper food, want of cleanliness, debility, etc.

The treatment of mange will, of course, be regulated in some measure by the cause; our object being to destroy not only the mange insect, but the ova or "nits." We cannot destroy the ova while they exist as ova; but by dressing with certain mixtures, we may kill the old acari, and by continuing the same destroy the young ones as they emerge from the eggs or nits. If the cause be want of cleanliness, bad diet, etc., we think it would be the preferable plan, as the digestive organs will most likely be more or less implicated, to give a mild laxative, after which to follow up by tonics; place the animal in a well-ventilated, roomy box stall, give him easily digestible and succulent diet, and attend to his general cleanliness, etc. With regard to external applications, it would be a most futile attempt on our part to enumerate all the nostrums and recipes which have been advocated and extolled by many as certain cures; it would be a most futile attempt, for their name is legion. Suffice it to say that, as a rule, we have found the following mixture to act very beneficially: Mix together equal parts of oil of turpentine, oil of tar, and rape oil or common commercial olive oil. Take especial care to apply it well to every part, not only which appears to be affected, but which may even be suspected to be. It will be useless to merely daub over the bare patches, but it must be rubbed well into the roots of the hair. Apply this mixture, say three times, washing off the old dressing with soap and water, before applying a fresh one; and let there be three or four days between each application. If this does not succeed, add flowers of sulphur to the mixture, and apply the same as before. When we see a well-fed, sleek-coated horse affected with mange, we may safely conclude that it is the result of contagion. Internal remedies will scarcely be called for in this case, but only the external application just named. It is sometimes advised to bleed in such cases; but it has no beneficial effect whatever. A few words may here be added with regard to preventives, which, however, will at once suggest themselves; they are, with regard to contagion, not to let a healthy animal be in proximity to a diseased one, or to use anything in common with him, or to use anything which the affected animal had, unless they be thoroughly cleansed. Good daily grooming, diet, and proper exercise, etc. We have omitted to state that the parts generally affected in mange are the head and face, particularly the muzzle, eyelids, etc., the sides of the neck, withers, armpits, and insides of the thigh.

Mange, affecting the bovine tribe, is similar in nature to that which we have already described as affecting the horse. The causes are much the same—contagion, debility, privations, long exposure to the inclemency of the weather. It sometimes supervenes on the removal from poor food to luxuriant. The principles of treatment will be the same, making allowances, of course, for the different ways of management in the two species of animals.

As affecting the sheep, the disease is known by the name of scab, and is essentially the same affection as we have already described. We propose at an early day to discuss the subject of scab in sheep and its treatment.—*Prairie Farmer.*

It is stated that it has been for years a custom with some farmers in Georgia to rear only hornless cattle. When the calf is old enough for the horn to start, a very small protuberance is felt upon the bones of the head. Take a knife and cut a small cross over this little horn, and lift out the incipient horn; press the edges of the wound together, and put an adhesive strap over it, and there is no more trouble, and you have hornless cattle.

INTERVIEW WITH VANDERBILT.

He Disposes of the Statement That Maud S will not do Her Best When He Drives.

"Have you noticed, sir, the paragraphs that have been going the rounds as to Maud S, and your last purchases?"

"Some of them; which are so absurd they must have been written for the sake of gossip, or for party purposes, to underrate the late performances of my team and the future of Maud."

"can you recall to mind what stories you have read or heard concerning Maud?"

"Not entirely; but there was a certain class here ever on the watch to report and magnify the slightest thing; saying thel would fire and blister her if they owned her; that she is lame; would never race again, and all that sort of thing. Others had it she would not go clever to the pole nor take kindly to my driving. Now these statements are all wrong. In my judgement, she is sound as ever she was in her life, and I think will beat her record. Then, as to her road work, I never had any trouble with her; I always knew she was a mare that would not brook unkindness, but if handled gently you can do almost anything with her, that is, if she is fit to trot; of course, she is like all high-bred good-feeling horsee, she needs regular exercise. If she happened to make a playful move or shift her gait on a down grade, when her shoes were worn thinner than usual—for I drove her with weights—it would be magnified into a great failure. The fact is, and Mace, here, will tell you, that last spring, shortly after she came home, I drove her and Lysander just as fast as he could go without breaking (as I make it a rule not to let my horses get in the habit of breaking, but teach them to try and beat each other), and she went as steady as when making her best time. I drove her occasionally in the fall, with that mare (pointing to Early Rose), and she acted very well; they trotted fast and steady.

"Yes," I said; "Mr. Phelps was mentioning to me that whenever you returned from driving them you expressed yourself highly pleased with their speed and behavior."

Mr. Vanderbilt closed this part of the conversation by saying: "I've found many of my horses more difficult to manage than Maud."

"Will you please relate the particulars as to the management of your most famous horses since last summer?"

"Yes; I will briefly state that I was driving Maud S with Lysander at Saratoga, in August, when it occurred to me I would get her ready and show a fast mile, heating, if possible, 2:10¾. In that view, I sent for Bair to come on, and told him to take her inhand, expecting to get her in condition and drive Lysander or some good horse to trot with her. I knew Clingstone was a good pole-horse, and I had seen his owner, and we had a perfect understanding about them."

"Bair, after a few days work at Saratoga, and after I had been to Buffalo to see Clingstone trot, informed me he must take Maud S to some level mile track to get her in order. I at once shipped her and Lysander with Bair and my men to Hartford. It was then about four weeks before the Hartford meeting, and he said he had not time to get her in order, but thought he could by the time Clingstone would get through his engagements in Boston—about five weeks.

"With this understanding he went to work at her. A few days later I bought Early Rose—that is, I got Mr. Rockefeller to let me have her at just what he paid for her—and sent her at once to Hartford. She had never been hooked double; she was hitched with Lysander; they went fast, and it was at once seen that she was going to be a wonder. In a few days the meeting at Hartford came off, and I took a party of friends from Saratoga over to Hartford, where we saw Early Rose and Lysander go, and then drove her—while the inside of the track was wet with the sprinkler—on the outside, a mile in 2:18¾. We were all well satisfied that, in the afternoon, when the track was much better, she could, on that day, have made a good race against Clingstone and Thorne, who trotted in 2:17 that afternoon.

"Aldine had trotted the day before, and trotted again the next day. Mr. Shepard bought her during her last race, and the following day Mr. Rockefeller bought her of him for me after a trial with Early Rose, which conclusively showed to those present that they were going together as a team. They trotted on this occasion in 2:25, the last half in 1:11, and the last quarter in 34 seconds.

"I then sent word to Bair to drive them together, and the next Friday I would bring a party of gentlemen from New York to see the team trot a fast mile, and also to see Maud S trot a fast mile single and double with one of the mares. Before this Bair put Maud S with Aldine, and they went in 2:27; He was afraid, as he afterward told me, to let her go any faster, as she had not lost much flesh since leaving Saratoga. He drove Early Rose and Aldine in 2:25, and repeated in 2:21 on the following Monday, the track not having been touched since the racing the week before, which was the only fast work they had. I told him then to have the track harrowed and scraped, and I would bring the gentlemen up on Friday next. I fully intended to do so, and had invited them to meet me in New York on Friday morning. This was on Wednesday, when unexpectedly I got, at Newport, on that day a letter from Bair, saying he would show me as fast a half mile as Maud S ever went, but that she had lost so little flesh he was afraid to drive her a mile as fast as she could go.

"On receipt of this letter I made up my mind I would take no gentlemen to Hartford to show them a half mile. I telegraphed them all that the engagement for Friday was off, and sent a message to Bair to drive the mares as fast as he could the next day, Wednesday, Sept. 13, and ship them to New York with Maud S and Lysander on Thursday, and notified Mr. Toucey to send a car for them on Wednesday. He drove them, not against 2:16¾ or any other time, but merely to see what they could do, and he telegraphed to me that evening at Newport that they had trotted in 2:16½."

Thanking Mr. Vanderbilt for the foregoing matter-of-fact statement, I remarked: "It is astonishing that these mares who have been worked together such a short time, only speeded on the occasions mentioned, and Aldine having but two weeks' experience to the pole, should trot in 2:16¾. Mr. David Bonner, who is considered good authority, said, in an interview published in the *Spirit* last July, that it requires long practice and patience to get a perfect double team, and one reason Edward and Swiveller go so fast is because they are naturally harmonious in action, and have been driven together several years."

"True," replied Mr. Vanderbilt, "and it goes to prove what superior speed and double-team qualities Aldine and Early Rose possess. Some slurs were cast for two or three days upon the timers; but it was soon ascertained by all unprejudiced horsemen that the timers were just as reliable and as correct and honest men as ever timed a horse. In fact the team themselves, by their individual races during the season,

and tha fast time they hava shown subsequently, with the owner driving them, removed all lingering doubte as to tha authenticity of their great performance."

"Are you acquainted with tha gentlemen who acted as timers?"

"No, I hava never met them to this day; but Mr. Hickok tell me ha knows tha gentleman well who held tha watch, which indicated 2:16 2-5, and that ha is entirely competant and trustworthy to time anybody'e horsa."

"May I trouble you to state when and how you drove the team their fast trials at Fleetwood?"

"Thay cama from Hartford Sept. 14, and on tha 16th thay were driven by ma for tha first tima, and Aldine had never been on Fleetwood, which, you know, is a peculiar-shaped and graded track, and although fast now, it takes tima for a horsa to get nsed to it. I sent them a quarter in thirty-four seconds that day. On Monday, 18th, they were driven a half mile, with a break by Early Rose, in 1:08, which ie three-quarters of a second faster than any other gentleman evar drove a team when everything was fitted expressly for it, and with horses constantly driven together for threa years. Two days afterwards I drova tham a mila in 2:22, which is faster than any other gantleman ever drove a mila on Fleetwood track."

"This was indead a peerless performance," I suggested.

"Not axactly," resnmed Mr. Vanderbilt. "I hava always considered that Small Hopee and Lady Mac's mile, in 2:23, made fiva years ago, over a track that was that day fiva seconds slow, and the horses unprepared for the trial, is really the fastest performance of the kind ever trotted. But Early Rose and Aldine could have gone faster if I had sent them with more confidence aronnd tha first turn. On first attempt Aldine broke, as her collar seemad to bother her. I came back and had it hnrriedly attended to; but was so careful to keep them steady in getting away that the first quarter was slow—0:37, I believe—but they fairly flaw from there to the half in 0:33, and np past tha point of rocks to the three-qnarter pole, making tha third quarter in 0:35, which showe that they trotted tha middla half in 1:08, a feat that has never been accomplished by a pair of horses when driven by a non-professional.

"Than you are clearly of the opinion that you can driva them faster?"

"Yes, much faster, if nothing happens. I don't care to boast about it, hut I candidly think I will show a mile with them naxt season in 2:18 or better, and my usual weight is 200 lbs."

"May I ask how fast you think the team is capable of trotting, good day and track, drivan by an experienced professional?"

"I believe they can easily trot 2:15, but I shall not take any special troubla to maka the attempt nntil 2:16½ is beaten. As I said before, this time cannot be gainsaid, and the manner of taking it is entitled to as much credit as the performance of 2:16¾ at Fleetwood. No pnblic announcement was made that either avent would take place, and the persons timing the one are certainly entitled to just as much respect and credit for honesty and diointarestedness ae the othar, notwithstanding all partisan stories to tha contrary.

"Even tha owner of 2:16¾ tima has tacitly admitted that it has been beaten, for after 'lying on his oars' all summar, nntil Early Rose and Aldine trotted in 2:16½ ha then confidently asserted hie team could beat it, and angaged two of tha best track drivers in tha land to make an effort at proper training intarvals, which resnlted in 2:20½ during a public meeting, and 2:18 on a privata occasion, as annonnced by his chosen friends in the stand, but no one elsa that I know of mada it faster than 2:18½, and some good timers tell me 2:19 was tha correct time."

"But thare ie an argumant made as to the difference in tracke."

"Oh! that is all special pleading, and perfectly absurd to talk abont. When you ara asked what is Maud S's best time you wonld say '2:10¼,' bnt would not add 'let ma sea, St. Julien trotted in 2:12¾ ovar a track that ie three seconds slower.' Basides, Fleetwood is not as it was years ago. Trinket, after trotting ovar all the bast tracke of tha conntry, mada her best tima, 2:14, over it. Santa Claus turned it in 2:16. We saw Overman go here in 2:21, with a bad break, late in the eeason; and Pickard draw a top wagon in 2:25½, driven by his owner, Mr. McCoon. As you know, the Gentlamen'e Driving Associetion has a wealthy membership, who axpend more monay to keep the track in perfect order than any other Park Association."

"Ae yon have had a larga experienca with double teams, I wonld lika to get your opinion as to what constitutes a matchad pair?"

"Thera is a great diversity of opinion on that snbject. I put Early Rosa and Aldina together for a matched team to ba driven on tha road. It is a pleasnre to ride behind them, and see tha cheerful way they do their work, and, although they ara of similar color, I do not consider this an essential requisite, bnt I think that disposition, evenness of gait and stride, ara tha moet important qualities. Now if ona horse takes two steps to his mate's ona, or both together look as if it was with difficulty they could stand up without leaning against each other, snch a team, if they would trot a mile in a minute, a gentleman would be ashamed to ba seen behind. For instanca, I was once driving, as I then thought, in about 2:40 on tha road some years ago, whan a fellow, with a peddler'e wagon, came along driving an old crab and beat ma. I was somewhat ashamed, to be eure, bnt at tha sama time, I didn't feel like trading horses with him, and yat ha chuckled all over, ae if he had dona something very smart."

"Yon have a great deal of epeed in your stable at the present time."

"Yes; there are seven horses, connting Maud S, belonging to it; any two of them can trot in 2:20, and ara perfect single and double borses. They are all the fast ones I own, and if any other man can show such a lot I would like to see them. I claim, and think I will show, that threa of tham will he put together and trot in 2:15—Aldine, Early Rose and Maud S—'tima will tell.'" They will do it easily, and not as a scratch.

"There are so many conflicting reports flying around reepecting yonr programma for Maud S, next saasou, that I hopa you will excuse the liherty I take in asking you what is the real ona you hava marked out?"

"As the *Spirit* is the leading sporting newspaper of tha country, I would be glad to inform the public through it, but I have not fully made up my mind. She is now in charga of Bair, eubject to Captain Stone'e careful management, and whera she will appear next season will depend ou circumstances. My present idea is to let her trot during the regular summer meeting at Chicago, and, later, make a field day with her and eome of my other horses at Hartford, ehowing double and single performances, free to tha public. If no ill-luck befalls Maud, I think the turf annals of 1883 will ba 'marked with a whita stone.'"

Mr. Vanderhilt hereupon called for his sealskin overcoat, and, donning it, stepped into the buggy, and bade me a cordial "good afternoon," as he drove off with Lysander.—*Veritas in New York Spirit.*

FASTEST AND BEST RECORDS.

Doings of the Kings and Queens of the American Turf in 1882.

The *Turf, Field and Farm* gives a long list of the winners of the fastest and best running records:

Below will ba fonnd the hest races run in the United States up to the end of the year. It will be sean that the best previous records have not been beaten in many instances, yet the best performances of the season jnst passed will compara more than favorably with the best races of any previoue year. The half-mile record of Olitipa still stande best, but Soubrette has the honor of being second best, having to her credit a half-mile in 0:49. Neyella (2), a fine daughter of California, away out in Oregon, has scored five furlongs in 1:00½, thus taking the best time on record at tha distance. Monarch (3), has equalad the tima of Barret, 1:14, at threa-quarters of a mile, though Barrett's performauce is yet entitled to firet place from the fact that he was a two-year-old and carried 110 lbs., while Monarch is three aud had only 91 lbs. At three-quarter mila heats Joe Howell, the aged son of imported Bonnia Scotland, is the winner of the best raca at the distance ever ruu, having won at thrae-quarter mile heats in California, in 1:14½, 1:14½, 1:15. Preminm won the first heat. Tha record at seven fnrlongs has bean beaten in several instances. Littla Phil (4), with 111 lbs., ran the distanca in 1:28¾, which is the fastest race run at the distanca. Joe Murray (3), with 90 lbs., ran the distance in 1:29½, Little Minch (2), 75 lbs., and Fellowplay (4), 105 lbs., also ran the distanca in 1:29, while Strathspey (4), with 111 lbe., finished the routa in 1:29¾, each beating the best previous record, 1:30.

Ten Broeck's mile in 1:39¾ still stands ae the best, though Warfield, at Saratoga the past snmmer, won at the distance in 1:41, Wedding Day in 1:41½, and Blenheim in 1:41¾. Neither, however, carried as much weight as did Ten Broeck. The best mila with heavy weight is to the credit of Bend Or, ha having won a mila dash in 1:45, carrying 149 lbs. Dan K (aged), with 106 lbs., won mile heats in 1:43, 1:42¾. Creosote (4), with 117 lbs., ran one mile and a sixteenth in 1:48¾, the best at the distance, and Band Or (4), with 117 lbs., is second best in 1:49. At heats of ona mila and a sixteanth Bend Or was a winner in 1:49¾, 1:49, 1:51½, Bootjack having won tha first heat. Bend Or (4), 115 lbs., won a dash of ona mile and five hundred yards in 2:10½ and a dash of one mile and five furlongs in 1:46, carrying 125 lbs., both of which are yet to be beaten. At one mile and thrae-quarters Glidelia has clipped ona-quarter of a second from Checkmate's great performance of last year, and reduced the record to 3:01, Lida Stanhopa (4), 102 lbs., ran three miles in 5:25, thus beating tha best tima one-qnarter of a second. Raven won a mila and a furlong over five hurdles in 2:06, which now stands best on record. Tha subjoined tabla will show the creditable performances at the various distances:

HALF A MILE.

Olitlpa (2), by imported Leamington, 97 lbs.; Saratoga, July 25, 1874....0:47¾
Soubrette (2), by Alarm, 107 lbs.; Jerome Park, June 8, 1882....0:49
Lizzie S (2), by Wanderer, 97 lbs.; Lexington, Ky., May 8, 1880....0:49

FIVE-EIGHTHS OF A MILE.

Neyella (2), by California, 87 lbs.; Salem, Oregon, Sept. 18, 1882....1:00½
Olivia (2), by imported Ill-Used, 97 lbs.; Saratoga, Aug. 5, 1881....1:01¾
Bouncer (2), by imported Leamington, 104 lbs.; Long Branch, July 4, 1881....1:02

THREE-QUARTERS OF A MILE.

Barrett (2), by imported Bonnie Scotland, 110 lbs.; Moumouth Park, Aug. 14, 1880....1:14
Monarch (3), by Monarchist, 91 lbs.; Saratoga, Aug. 22, 1882....1:14
Knight Templar (3), by Fellowcraft, 77 lbs.; Sheepshead Bay, L. I., Sept. 18, 1880....1:14

THREE-QUARTER-MILE HEATS.

Joe Howell (aged) by imported Bonnie Scotland; Bay District Course, Cal., Nov. 15, 1882; Premium won first beat....1:14½, 1:14½, 1:15
Bonnie Lizzie (3), by imported Hurrah, 101 lbs.; Saratoga, Ang. 16, 1881....1:15½, 1:14¾
Charley Ross (aged), by Joe Bowers, 118 lbs.; Brighton Beach, July 1, 1881; L. B. Sprague (4), 108 lbs., won first beat....1:17, 1:15, 1:15

SEVEN FURLONGS.

Little Phil (4), by Enquirer, 111 lbs.; Monmouth Park, July 3, 1882....1:28¾
Fellowplay (4), by Longfellow, 105 lbs.; Brighton Beach, Sept. 8, 1882....1:29
Little Minch (2), by imported Glenelg, 76 lbs.; Brighton Beach, Nov. 7, 1882....1:29

OME MILE.

Ten Broeck (5), by imported Phaeton, 110 lbs. vs. time; Louisville, Ky., May 24, 1877....1:39¾
Boardman (4), by imported Bonnie Scotland, 91 lbs., Sheepshead Bay, L. I., Sept. 20, 1880....1:40½
Warfield (aged), by War Dance, 87 lbs.; Saratoga, July 26, 1882....1:41

MILE HEATS.

Kadi (5), by Lexington, catch weight, about 90 lbs.; Hartford, Coun., Sept. 2, 1875; fastest second beat....1:42½, 1:41½
Bounce (4), by imported Bonnie Scotland, 90 lbs.; Sheepshead Bay, Sept. 7, 1881; fastest two heats ever run....1:42, 1:41½
Boulevard (4), by imported Bonnle Scotland, 110 lbs.; Saratoga, Aug. 2, 1881; Sir Hugh (3), 97 lbs., won first beat....1:41¾, 1:44, 1:46½

ONE MILE AND ONE-SIXTEENTH.

Creosote (4), by Creedmoor, 117 lbs.; Louisville, Ky., May 18, 1882....1:48¾
Bend Or (4), by imported Buckden, 117 lbs.; Louisville, Ky., May 20, 1882....1:49
Checkmate (aged), by imported Glen Athol, 118 lbs.; Louisville, Ky., May 16, 1882....1:50½

HEATS OF ONE MILE AND ONE-SIXTEENTH.

Bend Or (4), by imported Buckden, 117 lbs.; Loulsville, Ky., May 25, 1882; Bootjack won the first beat....1:49¾, 1:49, 1:61½

ONE MILE AND ONE-EIGHTH.

Bob Woolley (3), by imported Leamington, 90 lbs.; Lexington, Ky., Sept. 6, 1876....1:54
Brambaletta (4), by imported Bonnie Scotland, 63 lbs.; Loulsville, Ky., May 26, 1882....1:54
Girofle (4), by imported Leamington, 105 lbs.; Saratoga, Aug. 6, 1881....1:54½

ONE MILE AND ONE-EIGHTH HEATS.

Gabriel (4), by Alarm, 112 lbs.; Sheepshead, Sept. 23, 1880....1:56, 1:56
Ferida (6), by imported Glenelg, 108 lbs.; Sheepshead, Aug. 30, 1881....1:56¼, 1:57¾
Blarney (3), by Ballinkeel, 85 lbs.; Sheepshead, June 24, 1880....1:58, 1:57

ONE MILE AND A QUARTER.

Getaway (3), by Enquirer, 100 lbs.; Saratoga, August 4, 1881....2:07¾
Mendelssohn (3), by imported Buckden, 95 lbs.; Lexington, May 10, 1880....2:08
Sir Hugh (3), by Waverly, 102 lbs.; Saratoga, July 19, 1881....2:08½

ONE MILE AND THREE-EIGHTHS.

Uncas (4), by Lexington, 107 lbs.; Sheepshead, Sept. 23, 1880....2:21¾
Bounce (4), by imported Bonnie Scotland, 90 lbs.; Sheepshead, Sept. 1, 1881....2:23¾
Eole (3), by Eolus, 110 lbs.; Long Branch, August 20, 1881....2:24

ONE AND A QUARTER MILE HEATS.

Glenmore (5), by imported Glen Athol, 114 lbs.; Sheepshead, Sept. 25, 1880; Mary Anderson (3), by Ventilator, 83 lbs., won first beat....2:09, 2:10, 2:14

ONE MILE AND FIVE HUNDRED YARDS.

Bend Or (4), by imported Buckden, 115 lbs.; Saratoga, July 25, 1882....2:10½
Ada Glenn (5), by imported Glenelg, 108 lbs.; Saratoga July 24, 1882....2:11
Pinafore (3), by Enquirer, 97 lbs.; Saratoga, Aug. 22, 1882....2:11

ONE AND A HALF MILES.

Luke Blackburn (3), by imported Bonnie Scotland, 102 lbs.; Monmouth Park, Aug. 17, 1880....2:34
Tom Bowling* (4), by Lexington, 104 lbs.; Lexington, Ky., May 12, 1874....2:34¾
Checkmate (6), by imported Glen Athol, 119 lbs.; Saratoga, July 30, 1881....2:35¼

* Tom Bowling was permitted to extend the run to two miles. He ran the first mile in 1:41¾, mile and a half in 2:34¾, one and three-quarter miles in 3:00¾, and two miles in 3:27¾; the last two unofficial.

ONE MILE AND FIVE-EIGHTHS.

Bend Or (4), by imported Buckden, 125 lbs.; Saratoga, August 19, 1882....2:49
Ten Broeck (3), by imported Phaeton, 90 lbs.; Lexington, Ky., Sept. 9, 1875....2:49¼
Eole (3), by Eolus, 100 lbs.; Saratoga, Ang. 3, 1881....2:49¼

ONE AND THREE-QUARTERS MILES.

Glidelia (5), by imported Bonnie Scotland, 116 lbs.; Saratoga, Aug. 6, 1882....3:01
Checkmate (6), by imported Glen Athol, 124 lbs.; Saratoga, Aug. 6, 1881....3:01¼
Glenmore (6), by imported Glen Athol, 100 lbs.; Sheepshead, June 23, 1881....3:01¼

TWO MILES.

Ten Broeck (5), by imported Phaeton, 110 lbs., against time; Louisville, May 29, 1877....3:27½
Wildmoor (6), by Longfellow: Kansas City, Mo., Sept. 29, 1882....3:28
Bushwhacker (aged), by imported Bonnie Scotland, 99 lbs.; Saratoga, August 18, 1881....3:30

TWO-MILE HEATS.

Bradamante* (3), by War Dance, 87 lbs.; Jackson, Miss., Nov. 17, 1877 (?)....3:32¼, 3:29 (?)
Willie D (4), by Revolver, 102 lbs.; Prospect Park, Sept. 11, 1879....3:34½, 3:35
Lottery (3), by Monday, 100 lbs.; Sacramento, Cal., Sept. 21, 1875....3:36, 3:35½

* Bradamante's time very doubtful.

TWO MILES AND ONE-EIGHTH.

Monitor (4), by imported Glenelg, 110 lbs.; Baltimore, Md., Oct. 20, 1880....3:44½
Aristides (4), by imported Leamington. 108 lbs.; Lexington, Ky., May 10, 1876....3:45½
Mate (6), by imported Australian, 114 lbs.; Saratoga, July 31, 1875....3:46¾

TWO MILES AND A QUARTER.

Preakness (aged), by Lexington, 114 lbs.; Springbok (5), by imported Australian, 114 lbs.; dead heat; Saratoga Cup race, July 29, 1876....3:56¼
Hindoo (4), by Virgil, 117 lbs.; Louisville, Ky., May 19, 1882....3:57¾
Duchess of Norfolk (3), by Norfolk, 93 lbs.; Bay District Course, Cal., April 25, 1882....3:58½

TWO AND A HALF MILES.

Aristides (4), by imported Leamington, 108 lbs.; Lexington, May 13, 1876....4:27½
Katie Pease (4), by Planet, 105 lbs.; Buffalo, Sept. 10, 1874....4:28½
Ballinkeel (3), by Asteroid, 90 lbs.; Baltimore, Oct. 22, 1874....4:31¾

TWO MILES AND FIVE-EIGHTHS.

Ten Broeck (4), by imported Phaeton, 108 lbs.; Lexington, Ky., Sept. 16, 1875....4:58½

TWO MILES AND THREE-QUARTERS.

Hubbard (4), by Planet, 108 lbs.; Saratoga, Aug. 9, 1873....4:58¾
Kentucky (6), by Lexington, 124 lbs.; Jerome Park, Oct. 3, 1855....5:04
Tom Ochiltree (4), by Lexington, 118 lbs.; Jerome Park, June 17, 1876....5:00½

THREE MILES.

Lida Stanhope (4), by Waverly, 102 lbs.; Saratoga, Aug. 26, 1882....5:25
Thora (3), by Longfellow, 99 lbs.; Saratoga, Aug. 27, 1881....5:25½
Eole (4), by Eolus, 120 lbs.; Sheepshead Bay, Sept. 9, 1882....5:26½

THREE-MILE HEATS.

Norfolk (4), by Lexington, 100 lbs.; Sacramento, Cal., Sept. 23, 1865; best average two heats....5:27½, 5:29½
Brown Dick (3), by imported Margrave, age from May 1, 86 lbs.; New Orleans, April 10, 1855; the best second heat on record, and second best three-mile heat race....5:30¾, 5:28
Mollie Jackson (4), by Vandal, 101 lbs.; Louisville, Ky., May 25, 1861; Sherrod won the second heat. The last two miles of the first heat were run in 3:35, the last two of the second heat in 3:36¾; the ninth mile in 1:48¼. This is the best three heats and the best third heat on record....5:35½, 5:34¾, 5:28¼

FOUR MILES.

Ten Broeck (4), by imported Phaeton, 104 lbs.; vs. Fellowcraft's time (108 lbs.); Louisville, Ky., Sept. 27, 1876....7:15¾
Fellowcraft (4), by imported Australian, 108 lbs., Saratoga, Aug. 20, 1874....7:19½
Lexington (5), by Boston, 103 lbs.; vs. time; New Orleans, La., April 2, 1855....7:19¾

FOUD-MILE HEATS.

Fertda (4), by imported Glenelg, 106 lbs.; Sheepshead Bay, Sept. 18, 1880....7:23½, 7:41
Lexington (5), by Boston, beating Lecompte, drawn after first heat, 103¾ lbs.; New Orleans, La., April 14, 1855....7:23¾
Lecompte (3), by Boston, 86 lbs.; New Orleans, April 8, 1854, beating Lexington and Reube; age from May 1....7:26, 7:38¾

HURDLE RACES.

Joe Rodes (6), by Virgil, 140 lbs., mile heats, over 4 hurdles; St. Louis, June 4, 1878....1:50¾, 1:50½
Bay Rum (aged), by Baywood, 130 lbs., mile heats, Sheepshead Bay, June 25, 1880....1:51½, 1:51, 1:57
Judith (4), by imported Glenelg, 143 lbs., mile heats, over 4 hurdles; Prospect Park, Sept. 11, 1879....1:52, 1:52

STEEPLE-CHASES.

Disturbance (aged), by Chillicothe, 155 lbs., the full course; Jerome Park, June 4, 1881....4:28
Bertha (5), by imported Glenelg, 156 lbs., the regular course; Jerome Park, Nov. 2, 1880....4:33
Disturbance (aged), by Chillicothe, 155 lbs.; Jerome Park, May 30, 1882....4:47

If we boil milk, and immediately iuclose it iu au air-tight vessel, it will remain eweet for years; hut it will go eour when it is re-expoeed to the air, at sixty degreee aud upwards. If we freeza it, it will remain sweet so long as we like; hut when it comes to thaw, tho effect of the freezing is to hasten its decomposition. This, iudeed, holds good with hutter aud flesh aud vegetahles—with auy perishahle article, in fact. It ie their mechanical combination which tha freezing has interfered with, aud this is au aid to chemical decay.—*Prairie Farmer.*

The *Mercury*, Saundersville, Georgia, tells this yarn: Mr. M. H. Boyar of our city has a Jersey cow that gives butter and milk hoth. Sha gives euch rich milk that in milking it into the bucket it churus it. Mr. B. tall us that he gives her no extra food, only puts her iu a good pasture. Thie is tho kind of a cow to have. Wa examined the milk and butter after the cow was milked aud found large particles of butter in tha milk.

Horsa-racing seeme to he a lost art in Florida State fair has no races, although it has au exhibit of

THE NORTHWEST COUNTRY.

Grazing and Farming Lands Which the Canadian Pacific Will Open Up.

The following account of an interview between a subscriber of the *Sportsman* and a representative of the Winnipeg *Times*, with reference to the great cattle ranches beyond the Rockies, will be read with interest. Mr. Esmond is a gentleman of extensive experience, and articles from his pen have frequently appeared in the *Sportsman*.

"In the first place, Mr. Esmoud," said the reporter, "Will you give the *Times* what information you can concerning the ranches in the vicinity of McLeod and Kootenai?"

"With pleasure," was the response. "At Fort McLeod there is the Stewart Ranch Co. They drove in some 3,000 head of beef steers this season to supply their beef contract with the Bloods and Piegan and the Northwest mounted police at McLeod. They are also filling a contract for horses for the Northwest police, and have 400 head of mares. They also herd the Northwest mounted police horses on their ranches. They are going into breeding extensively, using a Clydesdale and a thoroughbred stallion. The latter is named Clandehoye, and is well known in Ontario, having formerly been in possession of Dr. Coleman of Ottawa. In the vicinity of Pincher Creek there is the ranch of Geddes & Brownskell, who have about 600 head of stock cattle. Mr. Morton, McCullough & Rivers, Ives, C. Smith, Peter Provost, Ives & Sharp, Brunean & Stanton, and the Halifax Ranch Co. have also large ranches there. Mr. Ives herds the Government cattle, and Brunean & Stanton, in addition to their cattle ranch, run a dairy farm. Col. McLeod has an extensive farm at Pincher Creek. Mr. Lee has a ranch located at the Crow's Nest Pass, directly at the foot of the Rockies. In the same vicinity is Garrett Bros.' ranch. Coming to the Kootenai river we find the Anglo-Canadian Ranch Co. and the ranch of 'Dutch Fred.' His land is between the Kootenai and Belly rivers, and is a very extensive farm. The farming land in that vicinity is A 1. It is there that the Blood reservation, comprising about 2,700 people, is situated. The distance from the Blood reservation to Fort McLeod is 18 miles, and to Pincher Creek is 32 miles. Grass and food for cattle is present everywhere in abundance."

"How about the ranches in the vicinity of Fort MacLeod?"

"In the vicinity of the Fort is the Capt. Winder Ranch Co., on willow Creek. My own ranch of 23,000 acres is on the Old Man River, about 2½ miles from Joe McFarlane's. Joe McFarlane's is also in that vicinity. The principal pasture on these ranches is what is called 'blue joint,' which is looked upon as an extra quality for cattle."

"Can you give me some information regarding MacLeod?"

"Fort MacLeod is on the Belly River about sixty miles from the line and is the port of entry for that vicinity. There is a Northwest Mounted Police station there, with about 200 men under command of Major Crozier, who is also acting as collector of customs. Among the large stores there, is that of I. G. Baker, whose business amounts to about half a million yearly. Captain Winder also has a big store, and the place contains a blacksmith shop, two butcher shops, three restaurants, etc. The population is small, and is principally composed of freighters and ranchmen. The only lumber mill in that vicinity is a saw-mill built by the Government on Mill Creek, between the Pincher and Old Man rivers, about forty-four miles from MacLeod. Lumber was worth $100 per thousand at Fort MacLeod this spring, and $60 at the mill."

"What are the prices of provisions at the Fort?"

"Potatoes sell at 5 cents per pound, butter 50 cents, eggs $1 a dozen, hay $25 per ton, and oats 7 cents per pound."

"What about the ranchers in Bow River district?"

"At Fort Calgarry or the Bow River district is the Cochrane Ranch Company, with from 13,000 to 15,000 head of cattle. They supply the Indians in that vicinity with beef. About thirty-two miles from MacLeod are the Stimpson Ranch Company, who drove in this season about 3,000. The farming land in the vicinity of Calgarry is good. There is a portable mill there owned by Major Walker, formerly of the Northwest Police; also Hudson Bay Company and I. G. Baker's stores. The population is of the same class as at MacLeod. This winter, Calgarry will be the headquarters for the engineers, surveyors, etc., of the C. P. R. The distance from Calgarry to MacLeod is 102 miles. There are three mails a month from Benton via. MacLeod. I left it for the end of the track to see what facilities would be provided for shipping cattle to supply the contractors."

"What road did you follow from MecLeod to Fort Walsh?"

"I came by the trail from MacLeod to Fort Walsh—a distance of 180 miles—and experienced a great scarcity of wood and water. From MacLeod to Medicine Hat, the crossing of the Saskatchewan by the C. P. R. is a distance of 60 miles, and from Medicine Hat to Maple Creek farm or Indian farm to the end of the track, 50 miles. They are now laying two miles per day, and expect to finish 50 miles more by Christmas or New Year. From the end of the track I traveled 50 miles to Swift Current Creek, where I hoarded the first passenger coach coming east."

"What is the state of affairs at Medicine Hat?"

"When I left Medicine Hat, the weather was extraordinarily fine, and though the river was frozen over at the crossing the air was quite warm. Up to that time there had been no storms to prevent the laying of rails and the contractors were straining every effort to push forward iron and ties. They will start this winter to build a temporary bridge across the Saskatchewan. The soil around Medicine Hat is average, and there is an abundance of bituminous coal in every direction. The Cypress Mountains are forty-five miles distant and abound with a plentiful supply of pine which furnishes the timber for the bridges. There has been snow in the mountains for six or seven weeks past, but none lower down. The settlers in that vicinity are much troubled with horse stealing by Indians, who are supposed to be the American tribe of South Piegans. On their last raid they carried off twenty-three animals, leaving every settler on the south side of the Saskatchewan without a single horse. They also stole sixteen horses from the railway."

"Who are the settlers there?"

"The biggest portion of them are men who formerly belonged to the northwest mounted police, and there are also a few Hudson Bay Company men. They all located before the line of railroad. A short time ago they received notice from Commissioner Walsh that they would receive no protection, as the Government had reserved two townships. They had a meeting and a petition to the Government was prepared setting out their case, and I am now on my way to Ottawa with it. Any squatters who came there since the location of the line have moved on towards Calgary. Among the settlers is an Italian Count, who has taken up land on the north side of the Saskatchewan."

"Did you meet with any buffalo?"

"I have not seen any, but I will tell you the reason that they have come into the country. They were on their way, but the South Piegans fired the prairies at Sweet Grass Hills on the American side, and the fires worked over to the Canadian side did not and leave a blade of grass on millions of acres extending from the hills to Belly River at Fort Hooper. Just previous to this fire, twenty-three head of Buffalo were killed by the North Pigeans on the Canadian side and the American Indians not wishing them to get any, started the fires."

"Are the Indians hostile?"

"They have to a great extent been pretty hostile among themselves, the greatest trouble being between the Crees and the Bloods. They did not have any fight, but war parties were out on the plains for nearly two months. The worst depredation they commit is horse stealing. Capt. Denny, Indian agent at McLeod, is an extraordinarily good man and is much liked by all the Indians, whom he has under perfect control. They do a little farming on the reservation and the supply farm is at Pincher Creek; here Mr. Wadsworth of the Indian department has quarters. He visits all the reservations. The Indians are not well pleased with the advent of the railway. The head chief of the Bloods is Red Crow, and the chief of the Blackfeet is Crow Foot, who is looked upon as the head chief of all. I think if the Indians offer any resistance it will come from Crow Foot, who is at the Blackfoot Crossing, sixty miles from MacLeod. On the Blackfeet reserve, I may state, there is a large coal mine, from which all exploring parties are expelled by Crow Foot. The Indians kill a few head of cattle belonging to ranchmen, but the latter are not troubled much by them." The Indians are all well armed."

"Where do the cattle driven into the ranches principally come from?"

"Most of the cattle come from Montana, in the vicinity of Sun River and the Teeton. They were worth $22 50 a head in the spring, but had risen in August to $30. The cattle are all free from disease, and were looking well and fat. Cattle which are close herded in that region don't thrive, and it is better to let them range as they please. Our food for cattle is far in advance of that in Montana. In some places the grass will sustain one head to ten acres, that is in the vicinity of Pincher Creek and along the base of the mountains from Kooteuai to Calgarry—but other places will not sustain one to thirty. Ranchmen have cut a good deal of hay for cattle for use in case snow should fall, but there is not much likelihood of it being used. The effect of the warm Chinook winds from the Pacific Coast is wonderful—a foot of snow in the vicinity of Pincher Creek lasting but three or four hours."

"What is the reason that no cattle from the ranches have yet been put on the Winnipeg or Eastern markets?"

"Well, we are only amateurs at present, but the real and principal reason is on account of the custom laws. Cattle for the ranches are admitted into the country duty free, but a clause of the act provides that if they be sold before the expiration of three years the duty must be paid. Consequently there will be none of these cattle in the market until next year, and the ranchmen hope to get them in by rail from Medicine Hat, to which point they will be driven from MacLeod, 150 miles across the prairie. The supplies for the ranches will also next year go out by rail to Medicine Hat, instead of through Montana as at present."

"I understand that you have witnessed several medicine dances among the Indians. Can you give some description of that?"

"The medicine dance is a sort of religious ceremony, being an offering they make to the sun. A large center pole is put up and from it are extended six poles covered with boughs in the shape of a circus tent. Anything that is given to the sun is hung to the top of this pole, and the dance begins, lasting from ten to fifteen days and nights. Then the braves repeat to the audience—sometimes 1,500 or more crowded into this rough tent—the deeds they have performed, which they call counting up their 'coos.' They in addition go through, in this tent, a representation of all the brave deeds they have committed, such as horse stealing, etc. If they have been shot, the spot is painted, and where an arrow has pierced them, one is fastened to the body. This is the time when young bucks who wish to become braves go through the ordeal. A slit is cut in the breast and an arrow is put through it, and a lariat then tied around each end and attached to the pole. Then they dance and pull at this until the flesh gives way and they are esteemed brave men, while those unable to stand the ordeal are regarded as cowards. While the dance is going on, any hostile Indian can enter the camp and sit there in safety, being regarded as under the protection of the medicine pole. At the last dance at which I was present on the Blood Reservation, Indians of the Kootenai and Nez Perce tribes from British Columbia were sitting in honor of the pole. At the same dance while one of the minor chiefs was counting his coos and going through a horse stealing act, the Indian representing the party from whom the horses were stolen accidentally shot him in the eye. The old chief like a true brave never said a word but arose and continued the narration of his deeds. Carbines were being fired almost continually in this tent during the dance. In a small tent adjoining the large one were two medicine men and during the length of the dance they remained there without any food.—*Canadian Sportsman.*

WOLF HUNTING IN THE WEST.

An Interesting Description of How the Farmers Fight the Robbers.

Wolves are still quite numerous in many of the Western States, and so destructive to the denizens of the farmyard that they entail an annual loss of thousands of dollars upon the farmers of a single county, principally by the havoc they commit among sheep, pigs, calves and poultry. Although both species of the lupine pirates found on the Western plains are equally bloodthirsty, yet the larger, which is known as the buffalo and the timber wolf, inflicts far greater damage than its smaller congener, which is called the coyote or prairie wolf, for not only is it stouter and taller than the latter, but also more daring, and so cunning that no fox that ever assailed a poultry yard can "hold a candle to it."

It generally pursues its prey in packs, yet it often hunts alone, especially when preparing for a raid on domestic animals, as it has sense enough to know that its chances of success are then much greater than if it were aided by companions. If it once makes a successful attack on a farmyard it loses much of its natural timidity, and becomes so emboldened as to renew the attempt at the first favorable opportunity, even though it may be aware that it will have to defeat a pack of curs to accomplish its purpose. It does not apparently care much for ordinary farm dogs, as it is so conscious of its superior strength and power that it frequently treats them with such contempt as not to deign to notice them unless they become too boisterous and pressing.

I have seen a gray wolf, during a wolf chase in Texas, turn on half a dozen hounds which were pursuing it and whip them in less than ten minutes, for one snip of its long and lance-like fangs was sufficient to make them run for home and howl with pain and terror. They were as demoralized a pack as ever I saw when the horsmen overtook them, for all the cheering and encouragement given them by their owners could not induce them to again take up the trail of their assailant, which was scampering over the plains a short distance in advance. If a gray wolf has a good start it can outpace any dog possessing less speed than greyhounds or swift foxhounds, and even the latter cannot often overtake it on a rolling country, it having far greater endurance than they have, and its gait which is a long and seemingly tireless lope enables it to traverse an extensive tract of country in a comparatively short space of time.

The ordinary methods employed for capturing wolves are trapping, poisining and shooting, but when these fail in keeping the number in a region to a proper limit, the farmers in a large area organize a grand mounted battue in which men, boys, and sometimes women, and all the dogs in the neighborhood take part. When the grand hunt is decided upon, those who are to participate in it arm themselves with every convenient weapon at command, mount their swiftest steed or mules, and accompanied by dogs of every grade and condition, march to a rendezvous to receive instructions from the leaders and wise men of the chase.

After receiving these they disperse to all points of the compass until they have formed a cordon around the tract of country intended to be beaten up. When they are in position, one of the leaders fires a rifle as a signal to advance, and on hearing it the wolf-hating host march forward from all directions, either silently or shouting like Indians engaged in battle, while the dogs run about wildly or indulge in fighting and barking, the whole making a scene which would delight St. Hubert himself, provided that patron of the chase could appreciate such an undignified mode of hunting.

This yelling and barking causes all the wolves in the region to run from their lairs and hasten toward a common center, as they can see no way of breaking through the advancing lines of dogs, horses mules and men. When all the lupine pirates have been forced within a small circle, the dogs are let loose upon them, and then commence such a contest of the canine race as is seldom seen, even in the Ardennes. The wolves, driven to bay, fight as desperately as ever did Napoleon's Old Guard, while the dogs, encouraged by the cheers and commands of their masters, display equal valor and ferocity. The result is, that several victims are soon lying dead or dying on the battlefield, whilst others are flying in all directions as fast as their terror-stricken legs can carry them.

Should a wolf happen to buck through the lines, he is hotly pursued by some members of the hunt, and if overtaken is shot by a "first flight man," or killed by the dogs. Notwithstanding the great odds against them, several demoralized wolves may escape from the gory field, especially if the ranks of their human enemies are not well closed up; and when they once find themselves on open ground they show what they can do in running.

It is not an uncommon thing to have some of the prairie pirates actually die of fright, even before they are touched, on seeing the number and hearing the yelping and yelling of their enemies. When the contest is over, and the last wolf is dead, or has escaped, the hunters advance and count the slain, and then distribute them to those most entitled to them, or they may simply cut off the heads to claim the reward which some states offer as a premium for the destruction of the animals. The dead dogs are sometimes buried where they fell, but they are more frequently left to feed carnivorous birds and quadrupeds.

If the hunt has been a success, there is much rejoicing, as many of the participants in it feel that their bank account will be larger at the end of the year, by the extra protection afforded to their farm yards, for a single wolf is estimated to annually destroy stock and poultry worth from a hundred to a thousand dollars. The homeward march of the cavalcade is therefore a joyous one, for there is much laughter, and the incidents of the hunt are discussed in an animated manner.

Another method of hunting practiced in some places is, when the lair of a wolf has been discovered, to leave some bait near it so as to keep its occupant near home; then announce the "find" to the neighboring farmers. These, armed and mounted and accompanied by their dogs, assemble the next morning at the appointed rendezvous and march to the lupine pirate's den. If the pirate is in, which he generally is, as he only leaves it when hungry, the dogs, which have before this been kept back, are let loose and they soon rout the grey robber and send him scampering over the plains at his best pace. One of the hunters then gives the "view halloo," and the men and their mongrel pack break away as fast as they can. If the country is open the grey object ahead is kept in view most of the time, and this so excites the dogs that they keep barking all the time in all the canine keys of melody, producing a din discordant if not earsplitting. The hunters are as excited as the dogs, apparently, for they dash onward at break-neck speed, heedless alike of ditches and the holes of prairie dogs. The picture they present is spirited in the highest degree, being full of life and motion.

Should the fugitive get too far ahead, some greyhounds, which have heretofore been led by cords tied to the saddles of their owners, are let loose, and they soon bring him to bay. He then charges them fiercely, but being too active for him they easily escape his fangs, and when he attempts to flee, they bite him on the flanks, and thus the contest goes on until the pack arrives and kills him, or some hunter shoots him. The "brush" is generally given to the leading lady in the chase, while the successful hunter or the organizer of the hunt receives the remainder of the animal, which is only valuable for its skin and the premium on its head. These chases are not only exciting but useful, for while they afford pleasure to those taking part in them, they also help to rid the country of a pest which is a terror to every farmer. —*Turf, Field and Farm.*

A great improvement has been made on the schooner Nellie's cabin since her new owner took her in hand, and a couple of thousand dollars have been spent on her internal fittings what are said to be very elegant. She will come out in style in the spring.

There is a possibility of the Frolic being seen in Puget Sound waters next season.

It took the Ariel 19 hours to go from Saucelito to Eckley's ranch the last time she went up.

The Viva, Frolic, Azalene, Casco, Violet and Daisy all lie "below bridges" in Oakland Creek.

The last schooner built by Turner made yacht time to Mexico.

The inside work on the Spreckels yacht is nearly completed.

Work is going on steadily with the new yacht of Mr. Tevis.

HERD AND SWINE.

Quality in Beef.

It is not generally understood that our highest priced meats have come through long continued efforts at improvement, the original stock being almost as unlike our present improved farm animals as is the crab apple unlike the grafted sorts. No high improvement was possible among cattle until civilization eo far dawned among men as to invite improvement. What position other than the very lowest conld cattle have occupied in the 10th and 11th centuries in middle Europe, with prices merely nominal, as the following figures will show: Au ox could be bought for $1 75, a cow for $1 37½, a hog for 47 cents, a sheep for 29 cents.

Pretty much all farm labor, teaming, logging, etc., was done with oxen. From the tenth century to the seventeenth inclusive, agricultnral practice, iucluding stock growing, was rude in the extreme. Farms were not fenced, except in an occasional instance and then only in small parts. Crops were grown iu the open cleared country, the stock being herded on outside grazing land, set apart by the township authorities for tbat purpose. Inclosures were made near the farm houses for calves, and the cows were driven home at night, and driven to the distant grazing grounds in the morning. The peasants were mere serfs.

After the Norman conquest the feudal system held sway and the people had no rights in land, living by mere sufference, under a most object species of serfdom. Everything conspired to prevent incentives to improvement creeping in, so far as the peasantry were concerued, and the higher classes were absorbed in warlike movements, and other echemes for personal aggrandisemeut.

The peasant serfs held very small plats, hence joined iu plowing. A plow team was made up of four yoke of oxen, ordinarily, though sometimes a horse was put in the lead. Cattle were so little valued that they were wintered on straw alone. The idea of making a young thing grow from the start and mature early had not entered the minds of men, nor have we any acconnt of cattle being improved till early in the eighteenth century. We are told it ie true that the ancestors of the Blackleys had good cattle back into the seventeenth centnry. The Smithsons of Stanwick, Sir William St. Quintin, and Sir James Penniman were known among the early owners of very fair cattle.

But it remained for those who first devoted attention to breeding and feeding for meat production to bring ont the fact that farm animals conld be made to yield a larger amonnt of meat than formerly, and that this could be made materially better than formerly, through a system of breeding from the thick fleshed individuals in the herd, these always being found to fatten promptly, maturing early. Bakewell was a prominent personage in carrying on experiments in breeding for flesh and ready fatteuing tendencies, and little by little the old style high shouldered bony cattle, to a very limited degree, were transformed into those that were easier fed up, had more fat about the kidneys and under the hide at killing time than the old sort.

But it took a long continued, patient system of breeding to cause the cellular tissue, that which holds the fat about the kidneye and under the skin, to make its appearance among the muscles, marbling the meat. But this result has at last been brought about, and we see the evidences of this in the cnt up carcasses at the fat stock show, these being in every case from high bred steers. This higher quality of meat was not obtainable prior to the improvement, and it is to be regretted that deep rooted prejudice against what has been termed faucy stock, especially among farmers, through whom only advances can be made in furnishing consnmers with improved meats, has held back auy general concerted movement, confining the introdnction of the better classes of domestic animals to the hands of amateurs and meu of means, whose purchases and breeding movements were more frequently made through a spirit of euterprise, and a fancy for the work, thau for the mere object of makiug money.

Tbe lean meat found in the deep seated parts of a cut up carcass is generlly supposed to be a mere massing of flesh in bulk. Instead of this being the case, when we eat the flesh of fowl or beast, we eat the motive parts of the animal or fowl, each limb or other part of the body being made up of separate and distinct muscles, each one having a special part to perform in moving a limb, one set of muscles flexing and the opposite set extending the limb. These muscles are attached at each end to the bones by means of the tendons, as each muscle terminates in a tendon, this structure beginning where the fibres leave off.

Of these distinct muscles there are about 400 in the cattle breast. These are made up of bundles of fibere. These are eeen separated in boiled corn beef. By drying a small piece of raw beef thoroughly, and rubbing this between the fingers, any one can discover how minute the structure of the meat is as they will find each fiber to be made up of a hundred or more fibrils, each one of which is not larger than a fine hair. By placing these under a microscope they are found to be fully organized, are tubular, and furnished with projections snpposed to be provided for the purpose of holding the fibrils togetber. These minute organisms are accompanied by blood vessels and nerves, and the most important feature of all ie that in the high bred, well fatted beast, we find the evidences of all tiesues and fat, in the minute spaces between these fibrils.

The meat of the scrub eteer dries up quickly when sliced, cooks dry, and is utterly insignificant as compared to the flesh of the improved animal charged as the latter is with the rich meat juices which can only come through the peculiar provisions referred to above. Of conrse poverty in an animal, no matter how finely bred, prevents the development of high qualities. Breeding makes quality possible through the added agency of good feeding, hut no device of the feeder can give the miseing conetituents to the scrub.—*Cor. Prairie Farmer.*

Influence of Sires.

The views of the *Live Stock Journal* writere are worth qnoting:

The law which shall make breeding pass from the condition of a conjectnral to that of a positive ecience is as yet unwritten. Given a mare that invariably produces the reflex of the stallion, no matter how often the stallion be changed; or—vice versa, reversing the sexes—a horse, no matter how many mares he serves, that invariably impresses his 'mint mark' on his progeny, and the problem ia solved. Perfect animals of such constant and reliable productive powers are few and far between, and when found, are priceless, for with them the breeder knows beforehand what to expect. We know how that certain lines have their own characteristics, and we trace back, not so much to the immediate parents as to some potent ancestor. The black epots indicate the influence of camel blood, the white hairs that of Sir Hercules There are the big top-eared Melbournes; the dapper Arab-headed Venisons, with their coats shot with white; the descendants of Chanticleer, handing down his grey coloring and too often his sour bead; the get of Newminster, almost all good race horses, and, with few exceptione, delicate in training; the Knights of Kars, all natural fencers, and in America, that marvelous little horse Justin Morgan. A Morgan horse is a Morgan horse all over. The deep chest, muscular haunches, bold, fearless eye, proud hearing and color, tell him at a glance. What we want in a stallion is the power to transmit his excellencies to his offspring, the blood which dominates over and absorbs tbat of any other strain with which it may mingle, a potent, masterful blood, filling tbe veins of those born of it. Such a sire deprives breeding of a great measure of its uncertainty. The best stallion is he who, being really good in himself, most surely and closely begets stock after his own image, or tbat of some great ancestor, when mated with mares of every variety of blood and form. When yon chance to come across such an animal, go mark him well! Let your choice fall on one not only great in himself, but in his ancestry; patronize stallions the result of whose amours you have seen. Having met with the model and strain of blood you have been carrying in your mind's eye, ask to see his foals before deciding to send your mares to him. By his get ye shall know bim. Blood and performance alone will not suffice. Remember the failures of the Earl, the great gladiator, or the pig-eyed Blue Gown, and a host of others too numerous to name. Horses that verify the Arab maxim: The foal follows the sire, are those to carry the breeder over his difficulties.

As a rule the old law, that "like produces like," ie subject to many variations. The influences which compass the breeder who aims at the best alone are so numerous and intricate that he for the most part is compelled to walk by faith and not by sight. In embryology there is a point beyond which mortal ken has not pierced, a Rubicon which the most scientific investigator cannot cross. There are secrets of reproduction which the Creator has reserved for himself. To begin with, we cannot even fix the sex. Among the causes and variatione are soil, climate, breeding back, disease, accident, imagination of the mother, the influences of former pregnacy. One of the most dominent laws in that of hereditary trausmission known as "atavism." Agassiz has stated: "Children are not only children of their father and mother, but they are also children of the grandfathers and grandmothers; they are the children of generations preceding them, so much so that it is a well-established fact that very often children resemble their grandparents more than they resemble their parents.

Quoting such an authority as Darwin, we have the testimony that: "As a general rule crossed offspring in the first generatiou are nearly intermediate between their parents; but the grandchildren and succeeding generations continually revert, in greater or less degree, to one or both of these progeuitors. With crossed breeds, the act of crossing in itself certainly leads to the recovery of long-lost characters, as well as of those from either parent form. We can thus understand how, for instance, it is possible for a good milking cow to transmit her good qualities through her male offspring, to future generations; for we may confidently believe that those qualities are present, though latent, in the males of each generation." The vital importance of a pure-bred and distinguished prepotent ancestry on both sides is here demonstrated.

Law gives his opiniou that: "Prepotency is less frequently the perogative of the individnal than of the breed, which has been bred long and carefully to a particular type." Hence the value of Shorthorns and other pure races in imparting to other breeds, with which they may be crossed, their own qualities to a proportionately greater extent than the share they had in begetting them.

This grand law of inheritance is a force as uniform in its action and as invariable as the law of gravity; like gravity, its action is modified and interfered with by opposing forces, which oftentimes disguise its phenomena. As gravity acts alike on the feather and the bullet, so does atavism alike on animals. Beware that you do not sow tares with your wheat.

Mr. D. D. Fiquet, a dairyman of Houston, Texas, adopted some years ago a system of breeding which he thought would give him heifers when he wanted them and bulls when he wanted bulls. His method of procedure has been published time and again, and his success, so far as the reports have stated, is invariable. It is here repeated:

If I wish a heifer from any chosen cow, I do not let her go to the bull during her first approaching frenzy. I let the œtrum pass through unimproved, but begin immediately to prepare for its return. Thus my bull is kept in a lot or inclosure to himself. He is fed bountifully upon corn meal, grain, rye, oats, heat-producing food. He is restrained rigidly in the exercise of his creating powers. He is allowed to serve no other cow until the chosen animal has been disposed of.

As to the cow, she is permitted to run at pasture, is stinted as to feed, and fed altogether upon bran, root crops, green food, having nothing given her except cooling food.

When the cow's frenzy again returns, I have, or should, a very excited bull, rampaut in bis demonstrations of anxiety, and a cow bnt moderately so in her display of passion. It frequently happens, however, that I have to continue this treatment of both animals through a second period of the cow. For whilst the restraint and high feeding of the bull is sure to bring him in upon the very crest of passion's billow, the stinting or reducing of the cow's food for the same length of time does not always reduce her passion proportionally. Hence, I continue the treatment for another period, and have never failed upon its second return to have the proper conditione necessary to success.

Being thus very positive, from respective demonstrations of the animals, that the bull is by far the most vigorous in his passion, I couple them. The result is invariably a heifer calf.

When I desire a bull calf I simply reverse the matter. My cow is taken in from the herd, stabled and well fed, and well cared for. My bull is stinted as to food, and fed only on cooling food. Besides his passions are reduced by actual service. He is allowed to serve every cow presenting an opportunity, and these I seek from those in the neighborhood. Thus when the cow's period returns she is by far the more demonstrative animal of the two. The high feeding never fails to bring her in upon the flood tide of passion. I couple them, and the result is invariably a bull calf.

"Breeder and Sportsman."—The publishers of the San Francisco *Breeder and Sportsman* have issued a New Year's number, which is far superior in the matter of illustrations, not only to any sporting paper ever published in America but to any sporting paper ever published, A handsome lithograph of the celebrated four-year-old. Albert W, in thirteen colors, adorns the cover, and in addition there is a picture by E. Wyttenbach called "Boys in Trouble," which is vastly superior to anything previously done in that line, and is far in advance of the Christmas pictures in the New York sporting journals. The letter press is also creditable.—*San Francisco Examiner.*

Silos and Ensilage.

A. R. Cleveland, Dalton, Mass., has a silo attatched to the end of his cow stable. Its dimensions are 15 feet by 30 feet, and 16 feet deep, one-half above ground. The walls are a concrete of cement and gravel. The silo was covered first with straw six inches deep and then with plank 1½ inches thick. The whole was weighted with large stones to the average depth of two feet. In addition to Mr. Cleveland's labor and that of his team, the cost of the silo was $308 75. The fodder crops grown were corn and Hungarian grass. Fodder is most valuable for ensilage when in bloom. The product of corn fodder per acre varied from twenty to thirty-five tons. The cost of filling per ton of fodder put in was about $1. Two months' time lapsed before the silo was opened. As to its condition when opened: Of the top six inches was of Hungarian grass, two of which was a little mouldy. The corn smelled sweet and good, and after standing twenty-four or forty-eight hours the odor was similar to that of new bread. After first opening, the ensilage was all uncovered, and being exposed to the air, it smelled and tasted rather sour at last, yet the cattle always ate it with a relish.

Mr. Cleveland writes: "I think three tons of ensilage equal in value one ton of the best timothy hay. After feeding ensilage one week my six cows gained twelve quarts per day in their milk, after which while they did not show any additional gain yet they held their own. The milk and butter produced while feeding ensilage were as good as the products obtained in June from good pasture. As to the value of ensilage for other stock, my young cattle and sheep ate it with relish, and in preference to good hay. The daily ration was sixty pounds ensilage to each cow. It was fed at morning and night, thirty pounds at a feeding, with a small foddering of hay at noon. I seldom fed ensilage alone, using wheat middlings and corn meal, half and half, four quarts a day. As I continued to feed this ensilage my stock improved in flesh and appearance, being in poor condition when I commenced feeding. The system of ensilage feeding enables one with a little land to keep a comparatively large amount of stock. Last year I bought $180 worth of hay, while this year I wintered five more cattle on the same land and sold $100 worth of hay."

The silos owned by William H. Gilbert, Richmond, N. Y., are built at the end of his barn and extend into the side of a hill. The bottom of the silos are one foot below the stable floor, with doors extending from top of the silo to the level of the stable floor. Each silo is sixteen feet by thirty-six feet and nineteen feet in depth. The walls are of stone two feet in thickness and plastered with water-lime. The bottom is paved with stone and plastered. The cover is of 2-inch plank tongued and grooved. Last year the weighting was effected with common field stone, estimated at thirty tons on each silo. This season barrels filled with sand are used, giving a weight of 150 to 200 pounds to the square foot. These two silos cost about $800. Stone, delivered, cost $2 per cord; mason work, fifty cents a perch; labor on building, $100; excavation, $30. The sand for the necessary mortar was secured in excavating for the silo pit. Southern corn was planted with drill, thirty inches apart and cultivated same as field corn. This variety of corn grows large and is sweet and juicy. Corn fodder is most valuable for ensilage when the ears are large enough for roasting. One season with another, twenty tons corn fodder per acre is a good average. In preparing the ensilage the cutter was placed on the wall, so that the feed falls directly into the silo. The ensilage was cut into lengths of three-eighths of an inch, at the rate of eight to ten tons per hour. Two men were kept in silo, leveling and packing. The cost for cutting, drawing, and packing was between thirty-five and forty cents per ton.

Mr. Gilbert writes: "My silos were opened about three months after filling, the condition of the ensilage at that time proving good. There seemed to be no deterioration after opening, in fact the ensilage was as good in April as in December. Five tons of ensilage will keep a cow as long as two tons of the best hay. I secured from my cows when fed with ensilage twenty-five per cent. more milk than I could obtain from hay. The butter product was number one, with the flavor nearly as good as that made from grass. My horses and hogs ate ensilage greedily, though I did not feed them enough to ascertain value. I fed two bushels, or forty pounds to each head per day. I fed two pounds of bran, night and morning, though not with the ensilage. I never had stock do so well on any other feed; they gained both in flesh and health. Again, I never had cows do so well after calving as in the case of those fed with ensilage. I put in fifty acres of corn for ensilage, that cost me, when ready for cultivating, $433 10, including $5 per acre for fertilizer and cost of seed, and thirty cents per hour for team. Cost of cultivating, $30. With an average crop under such expenses it will not cost more than $5 to winter a cow. With good management a farm will keep two cows the year for every acre cultivated. In conclusion, I consider ensilage very profitable in the economy of the farm."

James Neilson of New Brunswick, N. J., has a silo fourteen feet by forty feet, and nineteen feet deep, half under the ground. Mr. Neilson considers a long, narrow, deep pit preferable; then if a hay knife be used to cut down smoothly at the end, there is but little loose fodder exposed to the air, and consequently a minimum of waste. The walls of this silo were of concrete one foot thick. The cover is of loose boards and weighted with about 400 pounds of stone per square yard. Cost of the silo $1,320, including a deep underdrain, which latter cost about $150. Large Dent corn was sown with a wheat drill, rows three and one-half feet apart. Charging every expense, including $3 50 per load for manure, the ensilage cost $8 per ton. Mr. Neilson writes: "The milk produced by my cows fed with ensilage was exceedingly rich in cream and of remarkably pleasant flavor. My method of feeding is fifty pounds ensilage, thirty pounds brewers' grains and two pounds cotton-seed meal per day for a 1,000-pound cow. Upon ensilage thus fed my cattle gained in weight and appearance. I have contracted for a new silo twenty by forty feet, and eighteen feet in depth, to cost $500. It is to be built of chestnut posts set in the ground three feet apart, with double lining of hemlock boards, with tarred paper between. This structure will be all above ground."

I have seen salt fed to hogs for more than fifty years, and in the last twenty years have fed many heavy hogs, ranging from 300 to 600 pounds net. I feed them all liberally with salt; have never lost one nor has one been sick an hour. These hogs have been fattened in a close pen, and their principal food was corn meal made into a dough. This dough I have salted at least once a day. Sometimes my hogs would fail to clean out their trough, in that case I would put a handful of salt into my bucket, with some water, pour it into their trough, and they would lick it up with much relish. In addition to the salt, I feed coals from the stove. I make it a regular custom to feed coal, and it is astonishing what a quantity a hog will eat, and how healthy and [illegible] it will make him. Let the hogs have plenty of salt [illegible], and we shall hear less of the cholera.—*South*

Getting the Cream.

The best process of making sweet butter or more properly sweet cream butter, is as follows: For this product the cream, whether in creamery or dairy practice, is almost universally obtained by the cold process, and the milk should be set as soon after it is drawn as possible, and promptly cooled. The use of covered vessels should be avoided. If the vessels containing the milk are surrounded by cold water or cold air there is no possible advantage in their being covered, while the quality of the butter is impaired by the means. Not only is the quality of the butter improved by exposing the milk and cream to the action of free air, or air from which the vapor has been condensed by contact with ice or ice cold water, but the flavor and aroma of the butter are improved. No funnel, tube or other attachment to any form of cover yet began to remove nearly all the objections to it.

In the Danish practice the milk is set cold, and skimmed after twelve hours. In many dairies, and indeed it is claimed to be the more general practice, the milk is skimmed twice, only the first skimming going into the sweet product. The cream from the morning's milk is kept cool over night, and the next morning mixed with the evening's milk. It is then put into warm water and the temperature raised to 52 degrees, stirring to make sure that it is all evenly tempered and aired. It is then churned in a geared churn with vertical paddles, driven rapidly for 40 minutes, during which time the temperature rises to 59 deg. No water is allowed to come in contact with it at any time. If it is desirable to fill up the churn, new milk is used. For rinsing down the churn skim milk entirely sweet is used. When the butter comes in little pellets it is collected on a hair sieve, through which the buttermilk is strained, then carefully hand-worked till the residue of the buttermilk is extracted and gathered into little lumps of two or three pounds. It is then weighed, and salt to the amount of three per cent of its weight sprinkled over it, when it is piled up and left to become solid and for the salt to draw any remaining particles of milk. It is next cut across the lumps, mixed, and the salt worked into it. If it has become soft in the process of working it is broken up and placed in a tin vessel, with sticks to keep it from contact with the tin till it becomes firm. It is then rolled with plated rollers a few times, packed in wooden tubs and sent to market. There it is graded, re-salted and tinned, after which it goes to the ends of the world in perfect condition.

Pig Papers.

As a rule the pig is reared for the money that is in him. We may talk about cheap meats for the millions as a necessity justifying the rearing of swine, and persuade ourselves that the man is excusable who at this day places before his fellow men, as an article of diet, that which in olden times was rejected by an honored people as unfit for human food. Little difference, however, does it make to the man thus excused, whether we think of him as a philanthropist or as one engaged in leading mankind astray, so long as he has a fair profit on the pigs he rears, or on the pork products he can place on the market. If there were no money for him in the breeding and rearing of hogs he would not engage in the business. We find, however, that to nearly every farmer and cottager in the land there is a profit in pig raising, and so long as such is the case, we may expect to see this among the leading industries in civilized America.

The rapidly-growing interest in swine breeding in the Union is shown by the late census returns. According to these there were on farms, in June, 1880, 47,683,951 hogs, the rate of increase since 1870 being ninety per cent., while the rate of increase in population during the same time was only thirty per cent. The census returns show also that nearly two-thirds of the hogs in the United States in 1880 were in the five States of Iowa, Illinois, Missouri, Indiana, and Ohio. With facts and figures such as these at hand it is not surprising that the live-stock and agricultural papers, particularly those of the West, should devote more attention than formerly to swine husbandry, and that public records of breeding stock should be established and sustained; nor, on the other hand, that all parties interested in swine breeding should more eagerly avail themselves of every means calculated to aid in the successful prosecution of this work.—*Breeder's Gazette, Chicago.*

ABERDEEN OR ANGUS, WHICH?—Mr. George Wilken Waterside of Forbes, Aberdeenshire, Scotland, appends the following to a business letter: "Your people are going all wrong calling these cattle Polled Angus. In the whole district of Angus there are not five hundred polled cattle. In Aberdeenshire there are nearly five thousand. Besides, if they would look at the herd books they would there find that they have always been called Polled Aberdeen or Angus. It seems a small matter, but as Aberdeenshire has always had by far the greater number of the breed, and has made the name of Aberdeenshire beef famous, I think it a mistake to call the cattle Polled Angus, as it is not correct. There is a wide difference between them and Galloways, and I think some of your people are being hoodwinked with these. Galloways can be bought at less than one-third the price." And upon the same subject Mr. F. B. Redfield, of Batavia, N. Y., writes us as follows: "After much controversy and 'Aberdonian partisanship,' it seems to be finally settled in Scotland that my favorite breed of cattle shall be called Polled Aberdeen or Angus cattle; and at the late meeting of American breeders in Chicago it seemed to be almost the unanimous sentiment that we should not depart from the full title given the breed in their native home. Therefore, I wish you would insert the complete name as above, in my card, in place of the words Polled Angus. The Geary Bros., in their card, are right on this point. Some others I see still use the wrong, or rather only part of the accepted title; and in at least one instance there is yet the confusion of the two Scotch polled breeds under the common name of 'Scottish Polled' cattle. It is time that we reach some uniformity in this matter; particularly is it time that this Polled Scot business was done away with."—*Breeder's Gazette, Chicago.*

In killing a number of pigs of the same litter and all receiving the same treatment there will be a difference in weight amounting to from 20 to 100 pounds, according to age and size. Invariably the pig that gets a start while young keeps the lead, and a difference of five pounds at six or eight weeks is made tenfold that a year later. Probably the larger specimens crowd the smaller and eat more, but the profit in a pig comes from getting him to eat as much as he can digest. A titman is usually a poor bargain even as a gift. A poor widow who had every year a present of the titman in his litter of pigs from a rich farmer in the neighborhood, at last learned that it was dear even as a gift and insisted on buying one of the best pigs in his lot, to make up for previous losses.

A pair of twin yearling calves belonging to J. R. Adams of [illegible]dy, Iowa, weigh 1,606 pounds each. So at least the [illegible]r puts the figures.

Currying Milch Cows.

To a farmer the idea of currying a cow, milch or otherwise, is an absurdity; but to dairymen who have highly bred cows, who take a pride in their business and get the top price of the market for their produce, it is a matter of moment, in that it is known to increase the milk flow and the butter produce by ten to twenty per cent. We say that this is known, and will further say that it is so far an established fact that few, if any, can be found to dispute it.

There are many points in the conduct of a dairy unknown, indeed unthought of, by farmers, that will presently have a prominent place in their management, very much to the benefit of themselves and those who receive and make use of their produce.

Among these are succulent food, protection from inclement weather, kind handling, thorough and careful milking, full and regular feeding, clean stabling (when stabled), and an absence of foul odors, good ventilation, plenty of light and that thorough cleansing of the skin without which no milch cow can perform her duty thoroughly and well. With all these we must, to have a "tip-top" article of butter, have the washing of the udder and teats before milking, and with this an entire absence of the filth accumulated in feeding and lounging between milkings.

Of all these, one of the most important is that of periodical currying, in that it cleanses the hide of superfluous hair, keeps it active and healthful, and void of that peculiar odor so commonly found in milk and sometimes in butter. It promotes the secretion and disposition of the putrid particles of the animal system which would otherwise be absorbed by the secretory glands and be carried off in the milk, and leaves the latter not only purer, but of a much better quality, and gives promise to the butter maker of a higher color and a purer flavor to the butter from the churn, hence a higher price in the market.

Herein may seem lots of trouble over details, but when reduced to a system they occupy little of time, labor or expense.—*Rural World.*

JERSEY COWS IN THE CHEESE DAIRY.—The insinuation is often thrown out that the milk of Jersey cows is not good for cheese. There is a tendency to this opinion in the minds of many growing out of the belief that it not as rich in caseine as the milk of some other cows—an opinion which is not well sustained by analysis of their milk. There may be objections against the use of Jersey cows in cheese dairies, but that their milk will not make as good cheese, or as much of it as the average of other cows, certainly cannot be counted as one of them. In milk of average quality there is as much butter as cheesy matter, and an equal quantity of each is deemed essential to all full-milk cheese. To have less butter than caseine is to approximate a skim cheese. There is, practically, no difference between a cheese made from milk having naturally a small proportion of butter, in comparison to its cheesy matter, and rich milk skimmed till the ratio between fat and caseine is the same. No man who understands merit in cheese will ever desire milk rich in caseine to make it of, because he will comprehend at once that the larger the percentage of caseine and the smaller the percentage of fat the more will the resulting cheese resemble skims. There is, perhaps, no cheese in the world which stands higher among cheese fanciers than Stilton, which is made of new milk, with half as much cream as belongs to the milk added to it. That makes the milk once and a half as rich in cream as average milk, and this is just about what we have in Jersey milk.—*National Live Stock Journal.*

THE TEXAS HOG.—He is of Swiss cottage style of architecture. His physical outline is angular to a degree unknown outside of a text book on the science of geometry. The country razor-back prowls around in the woods and lives on acorns, pecan nuts and roots; when he can spare time he climbs under his owner's fence and assists in harvesting the corn crop. In this respect he is neighborly to a fault, and, when his duty to his owner's crop will allow, he will readily turn in and assist the neighbors, even working at night rather than see his crop spoil for want of attention. Crossing the razor-back with the blue-blooded stock makes but little improvement. The only effective way to improve him is to cross him with a railway train. He then becomes an imported Berkshire or Poland-China hog, and if he does not knock the train off the track, the railroad company pay for him at the rate of $1 a pound, for which they are allowed the mournful privilege of shoveling the remains off the track. The ham of the country razor-back is more juicy than the hind leg of an iron fire-dog, but not so fat as a pine knot.—*Agricultural Epitomist.*

RETURNED.—W. W. Spaulding, who this paper announced had gone East and would return with some polled Angus or Galloways, returned this week. We did not get to see this gentleman until too late to give any extended account of his trip with the stockmen. Mr. Spaulding says it is impossible to get an Angus or Galloway bull for less than $1,000, and that the breeders will not sell the females for any price. Failing in this, he has purchased and will receive here in the course of a month several head of Hereford cattle. Mr. Spaulding attended the Fat Stock Show at Chicago and gives such an account of the stock as is well calculated to encourage the inauguration of such an exhibition here. These will be the first Herefords imported to Oregon, we believe.—*North Pacific Rural Spirit.*

YOUNG HOGS.—It is most profitable to make pork from young pigs. A bushel of corn will produce more pounds of increase in weight when fed to a pig three months old. The cost of producing a given weight of pork increases with the age of the animal. If it is desired to produce an increase of one ton of pork by feeding 100 swine that increase will be more cheaply obtained by feeding pigs under six months of age than by feeding those which are a year old, or older ones. The man who allows his young pigs to have a scanty allowance of food permits the opportunity for profitable feeding to slip by and is obliged to produce his pork at an increased cost, by feeding when the swine are older.—*Lodi Sentinel.*

The *Rural Spirit* and its veterinary editor feel aggrieved, and justly so. Some weeks ago an item from some exchange, which attempted to be witty, that had been clipped and was lying on the table in the *Breeder and Sportsman* office, was taken by a printer to fill out a page just as the forms were going to press, and was published entirely without the knowledge of the editor. Not only this but (we speak from memory only) the expression "a dose of such words" was changed by the compositor to "such a dose," which quite altered the meaning of the sentence. Yet we fail to see where the publication evinced "a sense of littleness" on our part. Perhaps this expression, too, would express the intended idea better by transposition, thus: "Littleness of sense," or "littleness without sense."

Drying up Cows.

Should dairy cows be dried off, or should they be milked up to their time? To answer this question pat, yes or no, would only betray the ignorance of the speaker on the subject of dairymen's practices and prejudices. We know of no subject that needs intelligent airing at the meetings of our dairymen's associations so much as this. It is well known by all that no matter how great may be the flow of a cow's milk when she first calves, if she goes dry too soon she will not prove a profitable milker. Indeed, most dairymen would take a large-sized surprise party if they would only test the question as to the yearly yield of the two cows that gave the most and least at the time of calving. This could be approximated by keeping the dates of dropping calves and going dry of the different cows in the herd with their various yields weighed and recorded.

What we started out to say was that the strange part of this subject relates to the practices and prejudices of dairymen. In the country we find farmers almost universally drying up their cows with the fear of hurting them if milked up to calving time. Near the cities, where milk is sold to consumers, no attention whatever is paid to the time a cow is due to calve. She is simply milked as long as she will give it, and sold if she goes dry too long before calving.

Breeders of dairy cattle who handle high priced cows are in grave doubt on the subject of drying off. They all know it is a dangerous practice if not done with care and diligence. If the cow is neglected and forms milk in her udder that is not drawn off she is sure to suffer from the neglect, while good milkers are almost certain to give milk up to the day of calving, with a pretty general opinion that it injures the calf and creates too heavy a drain on the cow. Can our dairy expounders at the conventions lay down a safe rule to pursue in this matter? Let them try it, by all means.—*American Dairyman.*

Mr. George Fleming, President of the Royal College of Veterinary Surgeons, recently read a paper in England, on a new disease which he has discovered to prevail among cattle, in various parts of England. The *Live Stock Journal and Fanciers' Gazette*, of London, gives a synopsis of Mr. Fleming's paper, from which the following is taken: "It manifests itself by great enlargement and induration, as well as ulceration of the tongue. It also attacks the bones of the face and throat in the form of tumors, and is very destructive, especially among young stock. Mr. Fleming, by means of morbid specimens from the tongues and heads of calves, as well as by microscopical preparations, clearly demonstrated the affection to be due to the presence of a minute fungus, which probably obtains an entrance to the tissues either through the mucous follicles or an abrasion in the mouth. From the peculiar manner in which the fungus grows, and the radiating arrangement of its branches, it has received the name of *Actinomyces*, and it is consequently proposed to designate the disease *Actinomykosis*. It has hitherto only been noticed in Germany and Italy, and no fewer than sixteen cases are reported in the German medical journals as having been observed in man. Mr. Fleming produced some evidence to show that the fungus could be successfully implanted from a diseased to a healthy animal; and one of the German cases, in which a man was affected, would lead to the suspicion that it may be communicated from the lower animals to our own species. Instances were given in which the microphyte has also been found in a horse."

It is the belief of Secretary Teller that stock raising is an industry to which most of the Indians are much better adapted than to agriculture. What can be done by the Indians under favorable circumstances is shown by the example of the Navajo tribe of New Mexico. In 1869 they had about 1,000 head of sheep and goats. In November of that year the government furnished them with 14,000 sheep and 1,000 goats at a cost of $30,000. The report of their agent shows that the number has increased to 900,000 sheep and 200,000 goats. In 1881 the agent reported the wool clip at 1,000,000 pounds, and that 200,000 pounds had been manufactured into blankets. These Indians, numbering 16,000 by means of this small outlay, in thirteen years have become self-supporting, the total appropriation for their subsistence for the fiscal year 1883 being only $5,000. From 1870 to 1882, inclusive, the total appropriation for their support was $1,279,445, or an annual appropriation of over $98,000. During the years 1870, 1871 and 1872, the appropriations for their subsistence amounted to a total of $582,375. During the years 1881, 1882 and 1883, the appropriations for like purposes amounted to a total of $58,000, and hereafter there will be no necessity for an appropriation for their subsistence.

Butter is finished in the dairy, but not made there. The stamp of the dairywoman puts the gold in market form; but the work must be commenced in the field or in the feeding stables; and this leads at once to the consideration of feeding for butter. During the early, sunny summer months, when nature is profuse of favors, there is little to be done beyond accepting her bounty. The tender grasses are full of the needed nutrition, and they afford the constant supply of moisture without which the secretion of milk is greatly lessened. Yet, at this season, as well as all others, a pure supply of water is absolutely necessary. It does not meet the requirement if cattle have a wet hole full of surface drainage in the pasture, or a frog pond. While it is not probable that the tadpoles and wrigglers sometimes found in city milk have been drank by the thirsty cow, many infusions do exist in such pools that are hardly eliminated or rendered entirely harmless by the wonderful milk secretions of the animal. The cattle should drink from spring-fed boxes; and as often as these, under the hot sun, are seen to produce green growth or floating scum, a pail of coarse salt may be put in, and the current checked until the fresh-water growths are killed; the salt water is then drawn off, and for a long time the trough will remain pure and the water bright.—*Breeder's Gazette, Chicago.*

Hon. Harrison Bailey owns a cow, which, in the last four years, has dropped nine calves, three of them the present year, and of course is highly valued. A few nights ago she got into a cornfield and filled herself so full of the provender there that she was unable to rise when she lay down, and nothing short of her death was expected until a neighbor came along and undertook to relieve her by plunging a butcher knife into her flank just in front of the hip bone. This failed to have the desired effect, and another neighbor proposed to enlarge the hole made by the knife and remove the food. To this the owner would not consent until convinced that she would die anyway, and then the experiment was tried, and fully six bushels of undigested corn stalks and grass, in a state of fermentation, was removed from her paunch. The opening was then closed, and in a very short time the animal was on her feet and as contentedly chewing her cud as if nothing unusual had happened, and is to-day as well as any cow on the place.—*Shelby, Ky., Sentinel.*

Judging the Age of Cattle.

All kine are born with incisors, called "milk-teeth," which fell and are renewed at the periods mentioned below. Calves born toothless are premeture. Accordiug to Gueuou bovine animals have thirty-two teeth, of which twenty-four are grinding-teeth, or molars, and eight are cutting teeth, or incisors. The molars serve for grinding the food in eating and in ruminatiou; they are regularly distributed in four groups of six each, solidly planted. Two of these groups of molars form the entire deutition of the upper jaw, in which there are no incisors, but their place is filled hy a masss of elastic certilege forming e firm pad. The two other groups occupy the back of the lower jaw, end are separated by a space of about four inches, in which are planted the incisors. The eigbt iucisors in the front part of the lower jew complete the dentition. They are grouped in a semicircle, the middle ones being somewbat higher than those at the extremities. They are usually rather loose in the jaw, beving but e single root. At from two to two end a half years, the central incisors ere lost, and replaced by tbe permanent teeth. From this time to three years, the two adjoining teeth are lost; six months later, the three iucisors of each side; and at about four yeers the corner ones, all being replaced as they fall by the permaneut teeth. It happens sometimes, but rarely, that the corner incisors are not lost. Wben the permanent iucisors heve ell appeared, the auimal is risiug five years. The molers of botb jaws have been lost at about the same time, the four corresponding ones falling together, and being replaced hy uew oues. During this second dentition, and especially wheu cutting the permeneut molars, the enimel suffers more or less and eats with difficulty. It is well, if the suffering seems severe, or contiuues long, to heve the loose tooth extracted by e skillful hand. At five years the teeth are usually complete and reguler, the iucisors forming e semicircle, of which the corner teeth ere lower then those of the center. The upper surfece of the tooth presents a sherp, projecting ring of enamel. After seven or eight years this symmetry is altered, the central incisors weering down to ahout the height of the corners. After nine yeers, the enamel ring is worn down, the augles of the teeth show attrition, and the forms grow rounder. At from ten to twelve years, speces begin to show between the teeth. At from fourteen to seventeen they are worn down to the roots, leaviug wide interstices; the alveoler processes begin to be absorbed, and ths teeth grow loose. The rapidity of these changes depends to some degree upon the mods of life end the food of the animal. In heaths end sandy land the teeth weer out much fester, aud animals raised in them mey have the teeth quite worn away before they are old. In fertile pastures the teeth are preserved longer; but the dryness and perishing of the ivory occur at the eges above mentioned. When the incisors begin to fall, the enimals heve difficulty in grazing, end if intended for fattening, must be fed in the stall. Similer inconveniences follow the loss of one or more molars; the animal griuds its own food with difficulty, and the jaw becomes more or less deformed. Animals of this species are also subject to "wolf-teeth," which term is applied to teeth (usually the second molars) which grow long and pointed, interfering with the closure of the jaws and hindering mastication. Animals thus affected, feed with difficulty, and are apt to pine away. The position of these teeth makes it difficult to inspect them; but when discovered the tooth should be cut or snapped off to the level of the rest. Now as to the horns. In animals which have reached the age of three years, the horn has a ridge or ring at the base, and a new one is formed every year below the old one. But the number of these rings cannot be relied upon in estimating the age, as it sometimes happens that in an old auimal these rings are so blended that they cannot be counted. In youth the horns are thickest at the base, and taper to a point; but when the animal has reached eight or ten years, a narrowiug ofteu takes place at the base, obliteratiug several rings. This is often the case with auimals used for labor, as the pressure of the yoke and the friction of the parts which attach it to the horns wear away the rings. The appearance of the horns is therefore a much more uncertain guide than that of the teeth, in estimating age; still, it should not be entirely neglected.—*Boston Cultivator.*

It is pleasant to note that stockowuers have given attention, duriug the year, to improved breeds. Animals of good pedigree are found in our chief pastures. This is not only the case with cattle, of which we have some splendid specimens, but with horses, to wbich much thought has been directed. A number of Norman horses have been sold for breeding purposes by Royal Perry, our townsman, who is a brother of James A. Perry, the well kuown American importer, and among the progressive meu of this locality who have given attention to the improvement of draft horses for agricultural work, we may mention Henry Miller, P. Q. Turner, E. A. Sawyer, Abe Lewis and others. Of the forty head of these strong, sagacious horses in California, from ten to a dozen have been introduced and purchased by the enterprising farmers in this valley. This fine class of draft horses, selected from the best specimeus of Frauce, will iucrease in thie vicinity as the years roll by, and farmers realize the advantage of raising the best domestic animals.—*Gilroy Advocate.*

A calf suffering from haviug eaten too much bulky and indigestible food, may be helped by relieving him of his load. Carefully drench him with a solution of half a pound of Epsom ealts in three pints of hot water, to which add a pint of molassea and au ounce of ground ginger. Thereafter give every two hours half a pint of raw linseed oil, until the bowels begin to move. During a week thereafter feed steamed cooked food mixed with finely cut hay. Keep constantly common salt placed within his reach, not mixing it among the food. It ie wrong to feed young calves entirely on dry and bulky food. Their digestive orgaus are incapable of digesting such stuff, and mischief is likely to follow sooner or later. While dry food may be fed with impunity iu moderate quantity, it is, however, proper to alterate the same with more easily digested food, such as does not tax their digestive powers too much, and they will thrive much better.—*Breeder's Gazette, Chicago.*

The Austrian Minister of Agriculture has issued a report showing the quantity of game killed in the Cisleithan provinces in 1880, from which it appears that 1,027,090 head of ground game was shot, including 900,000 hares, 42,000 deer and 27,000 rabbits. Of feathered game 992,346 head was shot, including 717,000 partridges, 84,000 quail, 78,000 pheasants, 43,000 wild duck and 25,000 woodcock and snipe. Nearly 22,000 foxes, 12,000 weasels, 6,000 marteus, 2,300 badgers, 165 wolves, 65 lynx and 25 bears are included in the report. In Galicia the largest number of bears and wolves were killed; in Tyrol and Vorarlberg 2,000 chemois fell; in Styria 7,653 and in Salzburg 1,055. Bohemia returned 380,000 hares, and over 400,000 partridges.

It ia claimed that every gallon of milk has food value equal to two and a half pounds of boneless beef.

Kidney Worm in Hogs.

A parelytic state of the hind quarters of swine is an evil of no unfrequent occurrence. If ths cause of this condition was similar in all cases, tben the question of prevention or cure might be settled without any long discourse. The evil has been ascribed to the presence of worms in the kidneys, to sprain of the loins, to trichiuosis, rheumatism, diseass of the spinal marrow, fatty degeueration, scrofula, etc. A paralyzed (paraplegic) state of the bind querters, perhaps due to a reflex irritation, consequent upon the presence of large numbers of worms in the intestinel canal, coupled with constipation, lumbago or rheumatism of the loins, is not of unfrequent occurrence among swine, especially such as are badly housed during the colder season of the year, and is evidenced by pain, stiffuess end difficulty in using the hind quarters. A certain round worm inhabits more or less all the internal organs of swiue. It is tbe sams worm which infests the kidneys, and to which almost all cases of weakness of the hind quarters of swine is indiscriminately attributed under tbe name "kidney worm;" but kidney worm is, however, not of so common occurreuce as the number of inquiries ou the subject would seem to indicate. The presence of the same worm in tbe spinal canal, or in the spinal marrow, may produces peraplegia or paralysis of the hiud querters, in which case the animal would not exbibit any snch marked tenderness on being pressed over the loins with the fingers as he would if the ailment of tbe hiud quarters was due to a sprein or to rheumatism of the loins. It is next to impossible to diagnose the presence of worms in the kidueys, except by chance, through microscopic examinatiou of the urine, when minute eggs from the worms named mey be detected. But such knowledge would avail little or nothing, as no remedy would be likely to ceuse the destruction of tbe worms, or their removal from their natural lodgmeut in the pelvic cavity of the kidneys. When the peralytic condition is escertained to be due to the presence of a large number of worms in the intestinal cenal, Forber's solution of arsenic mey be given in doses of a small teespoonful every morning during a fortnight; then, after au interval of ten deys, it mey be repeated as before. It is tasteless, end mey be given among a little milk, which the enimal will drink voluntarily. Also give a sliced rew onion among the food daily. Provide fresh and cleen drinking weter, and give plenty of sour milk or buttermilk. The animals should heve well bedded, well ventilated quarters, free from dempness or draft of cold eir.—*Prairie Farmer.*

Unnecessary Dosing.—It is a very poor policy to resort to a continued use of nostrums, with the fallacions idea of warding off the consequences of neglect and mismauagement. Attention to proper and regular feeding, sufficiency of proper shelter, and daily attention to cleanliness of the animals and their habitations, will go further toward werding off disease or vermin than any kind or amount of nostrums will. Besides, the continued use of sulphur or other medicinal agents, will, in the course of time, surely prove detrimental to the system, by interfering with the normal functions of some one or other of the vital organs of the body, and thus reuder the animal liable at any time to the very ailment, which it was intended by this dosing to prevent. There is a more direct and far better way of preveuting lousiness on stock, such as a regular daily nse of so-called elbow grease, which may be applied in any quantity, and without danger of injury—in fact, the more of it the better; and in the case where animals at the start are lousy, a few applications of Scotch snuff will prove efficient. To the use of common salt we have no objection, provided that it be not used in a compulsory manner, that is by mixing it amongst the food. It is by far better to keep constantly placed in a separate trough, in some accessible corner, under shelter from wet, a quantity of common salt, or stone salt, of which the animal can partake at will, and there is no danger of taking too much of it. At the same time they should have ready access to pure drinking water.—*Breeder's Gazette, Chicago.*

Swine, perhaps, come more near to being the every-day, always available stock of the farmer, than auy other species of domestic animal intended for the shambles. With cattle or sheep he may have to wait two or three years for a full return of his investment, but from his hogs he can gather a crop every season, and handle the nimble penny over and over agaiu, with a frequency unknown in other lines of live-stock transactions. The hog is on hand to eat almost any respectable refuse which may be placed before him, and is ready to thus convert a great deal of otherwise worthless provender into solid cash. He is the scaveuger of the farm, and at the same time is the ready and reliable replenisher of ths farmer's purse. Though an iuveterate grunter, he is no growler, and, as an exchauge puts it, "comes down with the cash yearly, and pays, when properly bred and cared for, better dividends than bank stock, government bouds, or any other investmeut, in proportiou to the capital invested or labor expended."

The practice with many of discarding old sowe, and filling up from the young litter, is very unwise, provided the dams are of equal merit and breeding with the pigs. If, however, a young sow be kept till she is a year old, well fed iu the meantime, before being bred, she will bring as strong and growthy pigs as the older sows. The uotion that a sow should be bred early, that she should become a good suckler, is erroneous. Maturity in growth of the whole body is quite necessary to the developmeut of the milk glands, and, as we have proved to our owu satisfaction by sufficient tests, the well nourished sow, dropping her first litter at sixteen months, will, as stated, bring as good pigs as the older sows, and is quite as likely to have au ample supply of milk.

Foul in the feet of cattle is often caused by keeping the animals in filthy and wet barn yards, or on filthy and badly-drained stable floors. Treatment consists in removal to a properly-drained, dry and well-bedded floor. The feet should be thoroughly cleansed and detached or decayed horn should be carefully pared away without injury to vital parts. Then apply twice or thrice daily, by means of a feather, a sufficiency of a mixtnre of two ounces of oil of turpentine, half an ounce of sulphuric acid and one ounce of olive oil. When a change in the nature of the affected parts becomes apparent, till the cleft between the hoofs with a pledget of tow or oakum, saturated with equal parts of tar and lard, morning and evening, until the parts have assumed a natural condition.—*Breeder's Gazette, Chicago.*

Dairymen abroad have been experimenting for the purpose of determining which yield of milk, the morning or evening's mess, is the richer of the two. The decision was in favor of the evening's mess being the richer for both butter and cheese making qualities. The milk of cows fed ground feed in winter was richer than that produced by the same cows from grass in summer. This is not a matter of very great moment to the dairyman, though he should keep posted on all these little points.

Bull Butter Items.

"Butter's fat end fet's butter," says the bull butter edvocate, "and the thirteen per cent. of milk churned with the bull butter is used only because some people have a foolish desire for the flavor" of genuine butter. The oleomargariue, tben, which is claimed to be identical in composition with butter, lacks thet peculiar flavor of good butter. Why?

You cannot compete with oleomargarine unless you are willing to take pains with your cows and milk and look after all the little details in keeping the milk clean and free from atmospheric taints, and to make "gilt edged" butter at every churning.

There was a bull butter supper at the Palace Hotel last week which was attended by Govs. Perkins end Stoneman and one of the daily pepers called it a "Banquet to Governor Perkins."

The Sante Clara county dairymeu are thoroughly organized for the anti-bull-butter war.

The Deirymen's Society of Monterey county was organized week before last.

Polled Aberdeen or Angus Cattle.—The great defect of the Polled breed, as compared with the Shorthorn, was, that it was slow in maturing. Mr. McCombie soon perceived that this was the case. He was an early exhibitor at the Smithfield fat stock shows, but he was at first unsuccessful. After e minute examinatiou of the prize animals shown at Smithfield, he came to the conclusiou that he hed been beaten, uot because of the inferiority of his cattle, but because he was imperfectly acquainted witb the points of the auimals appreciated et the great English fat stock show, end the proper system of feediug them. The English agriculturists sneered at Mr. McCombie's Polled Scots, and contended that they would never take a first place in competitiou with the Shorthorns, Herefords and Devons; but Mr. McCombie soon gave them reeson to believe thet they were wrong. By diligent atteution to the feeding of his cattle, and the development of their flesh-forming properties, he succeeded in 1866 in producing the four-yeer-old ox Black Priuce, the champion at Smithfield end Birmingham. But a grester victory was in store, for in 1878 Mr. McCombie, with the youngest group of cattle at the Paris Interuetional Exhibition, gained, over all the breeds in the world, the special prizes as the best foreign breed, and as the best beef-producing cattle shown; while last year, at Smithfield, a Polled ox end e Polled heifer, each under three years old, geined the champion prizes.—*Correspondent of National Live Stock Journal, Chicago.*

In meking American sweet-cream butter the process of meunfacture does not materially differ from the Deuish, except thet it is geuerally washed end rarely worked by haud. It is perheps more generally made of the cream taken off the milk to be made into cheese in the two-product creameries. The stock from which it is made is unquestionably superior to the Danish, and with the care and labor bestowed upon its manufacture it ought to be the better article. That it is not is the almost unanimous opimon of commercial men and experts.

Krik's "Guide to the Turf, 1882," for Use in 1883.

The subscriber, wbile recognizing and gratefully acknowledging the kiud support he has received during the last five years toward publishing Krik's "Guide to the Turf," is still compelled to appeal to those most interested, breeders, owners and speculators, to assist in the publicatiou of the same by snbscribiug liberally toward its support. The large increase in the number of races at every point has more thau doubled the expenses of publication—the expenses for 1882 amounting to nearly $4,000 (not including auy charge for personal labor), which amount was scarcely realized by the subscriptions and sales combined.

The geueral scheme will remain the same as for 1882. The subscription price will be ten dollars, for which each subscriber will receive bound copies of Part I (races past) early in February, and Part II (races to come) about May 1st, and the monthly editions of races past, issued during the season. The two volumes will be bound in red leather to match previous editions, and will contain:

Part I.—Weights carried; racing record for 1882 (including all races run in the United States and Canada, or in which American-bred horses have competed abroad); tables of earnings of all horses, arranged under their respective sires, giving the earnings of the sires (compared with former years), accompanied with a statement showing the races at each distance for which the get, individually and collectively, have run; recapitulations of the number of races ruu at each distance, and the amount of money contended for compared with previous years; lists of dead heats, walks-over and matches, sales of thoroughbreds, giving date, name of purchaser and price; general index, which embraces a quadruple index:

(a) To important events, giving date, event, owner, distauce and page number.

(b) To places where racing occurred, arranged alphabetically according to States, giving page number.

(c) To winning sires, giving page number.

(d) To racing, with age, color, sex and pedigree of each horse, giving page number to each performance, with winners bracketed, and to the total earnings of the season, grouped with all others by the same sire, denoted by the last or heavy figure.

Part II.—List of subscribers; owners, their post-office addresses, racing colors and trainers; jockeys, their employers and lowest riding weights; names and addresses of pool-sellers, book-makers and "correspondents;" the racing associations, their officers, post-office addresses, dates of meetings and best routes to their tracks; winners of all the prominent fixed events, with name of sire, weight, number of subscribers and starters, time, riders and names of placed horses; yearlings of 1883 (foals of 1882), with announcements of yearling sales; nominations (with index giving page number of each engagement, those of the current year in plain figures, and of future years in brackets) for all stakes to be run in 1883, 1884 and 1885, that closed by April 1, 1883; dates of declarations or acceptances for stakes or handicaps; running records, showing the fastest and most creditable performances at all distances to the end of 1882; general index.

Besides these volumes, special editions, giving the racing for 1883 (indexed), will be issued as often during the season as may be deemed advisable.

Owners who wish the special editions sent wherever their racing stables may at the time be located will please notify the undersigned.

A "record of races," with index, will be issued about the middle of January. Price one dollar.

THE
Breeder and Sportsman.
PUBLISHED WEEKLY BY THE
BREEDER AND SPORTSMAN PUBLISHING CO.
THE TURF AND SPORTING AUTHORITY OF THE PACIFIC COAST.

OFFICE, 508 MONTGOMERY STREET
P. O. Box 2603

Five dollars a year; three dollars for six months; one dollar and a half for three months. Strictly in advance.

MAKE ALL CHECKS, MONEY ORDERS, ETC., PAYABLE TO ORDER OF BREEDER AND SPORTSMAN PUBLISHING CO.

Money should be sent by postal order, draft or by registered letter, addressed to the "Breeder and Sportsman Publishing Company, San Francisco, Cal."

Communications must be accompanied by the writer's name and address, not necessarily for publication, but as a private guarantee of good faith.

JOSEPH CAIRN SIMPSON, - - - EDITOR

ADVERTISING RATES.—Displayed $1 50 per inch each insertion or pro rata for less pace. Reading Notices set in brevier type and having no foot marks, 30 cents per line each insertion. Lines will average ten words. A discount of 10 per cent. will be allowed on 3 months, 20 per cent. on 6 months and 30 per cent. on 12 months contracts. No extra rate charged for cuts or cutting of column rules. No reading notice take for less than 60 cents each insertion.

San Francisco, Saturday, January 6, 1883.

Mr. M. J. Henley is a duly authorized traveling agent nd correspondent for the "Breeder an d Sportsman."

NOMINATIONS IN STANFORD STAKE.

Altbough the first Stanford Stake showed more nominations tbe twelve names in the appended list give promise of a good race when tbe time comes. In fact there is a strong presumption that the dozen are superior to any lot ever bred before in the United States. It could scarcely be otberwise from the breeding.

From Palo Alto are four, two by Electioneer and two by Benton, and these are reinforced by two others which have the further good quality of proper breeding on the sides of the dams. Then there is a Santa Claus from a Volunteer mare, a Nutwood from a daughter of Whipple's, Hambletonian, a Buccaneer from Pearl by Blue Bull, a Strathmore, his dam by Coaster, and an Egbert from Illinois Maid, the dam of Troubadour and Chicago Maid. There could not be more fashionable breeding, and it is safe to assert that in all the trotting stud farms there are no higher lines of blood.

Electioneer bas taken the lead of all tbe trotting stallions in the country since his location in California. His stable companion, General Benton, is showing trotters that some are enthusiastic enough to claim will dethrone the Electioneers. Buccaneer is the sire of Pride, and the Nutwoods are coming out in such force as to warrant the prediction tbat they will be worthy of the close relationship to Maud S. Tben Strathmore and bis son Santa Claus are sure to make a good mark, and though Egbert bas not as yet shown anytbing startling, his breeding is such to warrant every prediction.

But in the twelve youngsters named there are several that have already won distinction. Dawn has the fastest record ever made by a yearling in a race, and the fastest for any stallion colt. Bedouin won the trot at the State Fair and bis sire, Sultan, has done what no otber trotting stallion bas, viz., had a three-year-old wbich trotted in 2:22, and a two-year-old in 2:26. Tben Bedouin is inbred to The Moor, and we have for a long time been partial to interlocking the blood when the other conditions are right. Wben Dawn trotted in 2:59, Antevolo was second to him in 3:02, and as he has not been hampered with iron on his feet, troting that fast barefooted argues well for his future career. That the trotting of colts is going to be the mainstay of the tracks is already assured, and both on the Atlantic and Pacific the most exciting contests will be where tbe youngsters take a hand. The turf would languisb if it were not for the two and three-year-old contests, and the Derby, St. Leger, Oaks, Grand Prix in Europe and stakes in this country for that age, there would be a great falling off in the atteudance.

It was formerly claimed tbat the babies could not show speed enough to interest the spectators. With records of 2:36½ for a yearling, 2:21 for two and three-year-olds, 2:22 for a four-year-old stallion and a heat of two miles in 3:51, this claim has nothing to support it.

The Stanford Stake is the largest stake of the country, and this militates against a large number of nominations. Three hundred dollars each with a fee of $100 when the nomination is made deters a good many from participating, and a man must have a reasonable expectancy of a good colt to take the chances. Even with twelve nominations the amount is likely to aggregate about $3,000, so that the stake is not more than the regulation ten per cent. Should there be no casualities, however, we anticipate to see a large majority put up the balance of the stake. Two-thirds of them is our [illegible] make the second payment and at least six starters. The Stanford Stake for 1883 is to be trotted on the third Saturday in October, and this is likely to be the time fixed for those hereafter. The following are the conditions and nominations:

A sweepstakes for trotting colts and fillies of 1881, $300 each, $100 payable on the first day of January, 1883, at which time the stake will close, $100 on the first day of January, 1884, and $100 thirty days before the day fixed for trotting, whatever amount up to be considered forfeit and the neglect to pay at the stipulated time incurring forfeiture of the previous payments. The race to be heats of a mile, best three in five, to harness. First to receive sixth-ninths of the whole sum, the second two-ninths, the third one-ninth. In addition to the stakes and forfeits, the proportion of gate money, profit on pool sales and all other sources of emolument will constitute the gross amount to be divided in the foregoing proportion. Five or more subscribers to fill. The race to be trotted in 1884, not sooner than the latter part of August. The exact date to be fixed and announced on the first of January, 1884, or sooner.

No. 1. Joseph Cairn Simpson names br c Antevolo by Electioneer, his dam Columbine by A. W. Richmond.
No. 2. Justin P. Moore names b c Belnor by Strathmore, his dam by Coaster.
No. 3. John A. Goldsmith names b c Sydney by Santa Claus, his dam by Volunteer.
No. 4. E. H. Miller Jr. names b f Hambeno by General Benton, her dam Lady Hamilton by a son of St. Clair.
No. 5. F. L. Smith names b f Cora by Buccaneer, her dam Pearl by Blue Bull.
No. 6. Ariel Lathrop names b c Tramp by Egbert, his dam Illinois Maid.
No. 7. Palo Alto names b f Argo by Electioneer, her dam American Girl.
No. 8. Palo Alto names b c St. Just by Electioneer, his dam Fidelia by Volunteer.
No. 9. Palo Alto names b c Alban by Gen. Benton, his dam Lady Morgan by Rysdyk's Hambletonian.
No. 10. Palo Alto names b c Ione by Gen. Benton, his dam Irene.
No. 11. William Beach names ch c Dawn by Nutwood, his dam Countess by Whipple's Hambletonian.
No. 12. L. J. Rose names b c Bedouin by Sultan, his dam Gertrude by The Moor.

IMPROVED CATTLE IN CALIFORNIA.

Stock raising in California and, in fact, on the whole Pacific Coast, is in a sort of crude, undeveloped condition. Though there are a few good herds of grade and pure-blood cattle, the great majority of the stock on this coast is composed of scrubs, and the system—if the word be not a misnomer—of breeding and rearing cattle is the same as that in vogue before the conquest, under the domination of the padres. The cattle grow on immense ranges and are as wild as the coyotes, deer and other game inhabiting the territory with them. They are small, ugly and unattractive to the eye of either the expert butcher or the esthete. They furnish an article known in our markets as beef but sold for abont half the price of carcasses of first-class cattle, and the rearing of them is profitable only because they feed upon land which has cost their owners little or nothing (at the public crib, as the political writer would say), receive no care and only so much attention as is necessary to keep brother stockmen from stealing them, and therefore cost little to produce. These ranges are, in fact, simply game preserves, the game preserved being of the genus kine, and the cost of production the expense of maintaining the preserve against poachers and of capturing and marketing the game.

All this must change, and the change is already swiftly working. Good beef is scarce and high, with no prospect of being again as low as in the past. And the demand for good beef at good prices is increasing faster than the demand for cheap beef. Moreover, good beef cannot be coaxed by any art of the butcher from the carcass of the California scrub steer. Improved breeds of cattle, and the grades from those breeds, are in demand at good prices for the shambles, and at no time has there been such a hopeful outlook for the skillful breeder. Nor are our enterprising stockmen oblivious to these facts. The importation of pure-bred males at high prices was never more brisk, and herds of Shorthorns, Herefords, Jerseys, Alderneys, etc., are rapidly multiplying.

Meantime the tide of immigration, recently for a time checked and counterbalanced by emigrations eastward, is again setting strongly toward the golden shore, and in providing homes for these immigrants encroachments are being made upon the area of land hitherto devoted to cattle ranges on the Spanish-Mexican plan. The curtailing of the area of land available for wild cattle ranges—the breaking up of these immense tracts into farms and homes—while it will give us a strong impetus on the high road to prosperity as a community, will not curtail the meat supply. It will raise it, both in quantity and quality. More pounds of good beef can be raised upon a given area of cultivated land stocked with high-bred cattle than can be raised of poor beef upon the same land stocked with scrubs. And there will be more profit upon every pound of it at 6 or 8 cents on the foot than on the poor beef at 3 to 4 cents, though the cost of production be higher by reason of greater outlay for original stock and for care in the rearing.

No country can long be prosperous without a high system of agriculture—a system which cannot exist with the old style of stock-raising. Among the most promising "signs of the times" are the evidences that the vast stock-range of wilderness with its scrub bovines, its saddle-horses and its vaqueros, is soon to be superseded by well-cultivated farms, a variety of crops, improved stock and, in a word, a higher civilization.

"RING OUT THE OLD."

Very peculiarly for California the old year went out. There came clouds, heavy, leaden, dull masses, and then the flakes fell noiselessly, quietly, for all the world the same as in the East. There were white spatterings on the side-walk and unlike the simile that Burns draws in Tam O'Shanter "but a moment white, then melts forever," as they kept accumulating until there was several inches of the "beautiful."

It was a new experience for the boys, and the urchins in the neighborhood where we live were busy as beavers in rolling the snow-flakes into huge masses. Boys of older growth were inprovising sleighs and planks slipped on to the axles did duty for the occasion. It was very poor "slipping," however, and the runners cut through and ground along on the macadam in anything but a pleasant manner. There was little poetry of motion, or any other kind of poetry for that matter, in the effort to secure a sleigh-ride, though there were wet feet to those who were foolish enough to leave the comforts of a good fire to wade through the chillness. We must acknowledge that we were just foolish enough to make a pilgrimage, and the consequence was sore throat, epizooty, pinkeye and influenza all combined. Doubtless H. B. of the *Turf, Field and Farm* remembers a grand rose bush in front of the house—one of those magnificent Marshal O'Neil with yellow blossoms emulating a cabbage in size, gorgeous, grand, the perfection of the queen of flowers. In the early morning the bush hung full from the tiny buds proper for a place in the lappel of the coat to the full, perfect flower. At noon there were masses of snow on the branches, white and yellow scarcely in pleasing contrast, and dejection just as plainly marked in the bud, branch and flower as there was in the faces of those who made the pilgrimage spoken of to see their favorites beaten. Had there been a hammock under the apple branches as H. B. portrayed so glowingly it would have been well filled. As it is, we must reiterate that the less snow there is the better we will be suited, and much prefer rollers to runners.

Then again, a short experience like that of Sunday, Dec. 31st, may be an advantage in teaching us to be properly thankful for the blessings we enjoy, and without such an interlude it might be taken as something we are entitled to at all hazards. Those who caught a good share of the troubles attending throat and chest from wading through the snow can appreciate the bad fix of the horses in the last pinkeye siege and understand that speed in such a case was scarcely to be expected.

GAME PRESERVES.

Whatever feeling there may be in some quarters on the question of game preserves is one that arises from a mistaken idea. People do not preserve lands to shoot on because they are greedy and do not want to see other people shoot. True, they keep the grounds to themselves and prevent others going on them; but they do it in self defense. If they did not it would not be long before all the game would be gone.

With our fish interests, for instance, how would it be if close attention were not paid to the fish by the State. As it is, even now there are not as many fish as there should be and all the care taken does not seem to increase the number. With ducks it may be said that rather a different condition of affairs exists from other species of game. They are mainly hunted in the ponds and marshes which are within easy reach of the city and these grounds are to a certain extent limited. The demands of a large city are met by a great number of market hunters who frequent these marshes and rapidly kill off the game. No one blames them, of course, for trying to make money; but no one can blame the sportsmen in trying to have some fun too. The pot hunters whack away at the game at all times and continually and this had been going on so long that the birds began to get scarce as they were never given a day's rest.

Then the sportsmen saw that unless they took some steps to prevent it the ducks would almost entirely disappear. They therefore organized shooting clubs, leased tracts of land and keep these tracts preserved so that one day in the week they can go there and get a fair string of birds. They sow seed in the ponds and bait them also and they are careful about shooting too early or too late so as not to frighten the birds away. The birds as a general thing have the ponds to themselves all the week as the hunters usually go up only on Saturday nights and have the Sunday morning's shoot.

For the hunting interests generally this is a great deal better than it is to have all the ponds worked day after day by a lot of people who are only bent on making money and who have no special thought of the following season. Of course it seems hard that an occasional shoot can not be taken by people who do not belong to the clubs but there are plenty of grounds where they can go and it really seems as if they would be likely to get bet-

ter shooting on account of the preserves by the increased number of birds. At all events, it is now a recognized fact that those who like a regular shoot and a good one must belong to one of the clubs or else go a long distance from the city for their sport.

STOCK FOR AUSTRALIA.

Hon. Charles Kahlo. U. S. Consul at Sydney, New South Wales, paid a visit to San Francisco last week, and during his stay made a call upon this office. Consul Kahlo is an American and an enthusiastic admirer of the trotting horse. Before he engaged in the art of diplomacy his business was that of dealing in hard woods and buggy and wagon materials, and consequently he naturally enough took more than a passing interest in buggies and the animals that draw them. He chatted with us for some time during his call, principally talking about the style of horses that can be successfully raised in California and will find a profitable market in the Australasian colonies. He said, you Californians must bear in mind two things: First, that while English immigrants in Australia cling to their old-time notions and fancies, young Australians born in the country are as progressive as Americans, and are more like Californians than any class of people I have ever met outside of this country.

Seeing us taking notes of his remarks, Consul Kahlo said: "Now, I don't care to be interviewed in the regular way, and you had better leave that to the dailies. We will sit down and have a chat, and you can take what points you please from my remarks and give them to the public as your own ideas."

We are too modest and too honest to take the credit of Consul Kahlo's experience without due acknowledgment therefor, but will defer to his desire not to publish a set report of his remarks.

Two styles of American horses can be profitably sent to the colonies, in addition to big Kentucky mules, which are in big demand for the Queensland market. The first is the average roadster, nice-looking and stylish in appearance and able to pull an American buggy inside of four minutes. The other horse for which there is a limited demand is a first-class trotting stallion that can show as good as 2:36, but the price asked must not be above $4,000, even if the horse can do a little better. The roadster is wanted all over the colonies, but the most profitable market is New South Wales. There all the young men and all who aspire to be in the fashion drive an American-built buggy. an American roadster and use not only American harness but American whips and trimmings. California can supply all of these wants but a preference is given for Eastern buggies from standard makers. Australia exports hides to California which are made into harness that will find a ready market in the colonies. We think that every American horse shipped to Australia during the next ten years at least California ought to be able to supply. An ordinary California roadster worth here $125 will command in New South Wales $200 and there appears to be no present limit to the demand. But small, well-selected lots will be found more profitable than large speculative shipments. A large shipment is apt to glut the market. The shipper finds himself forced to sell and the buyer is thereby enabled to dictate terms. The horse for the colonies must be fully 15¼ hands and yellow or buckskin horses are not in demand. About five years old and broken, single or double, are the other requirements. For fine fast track horses the market will be found in Victoria where a trotting track has been built and the sport is becoming quite popular. Don't ship any thoroughbreds to Australia. They have enough over there already and, above all, never attempt to place any large draft horses on the colonial market. Every squatter in the colonies has imported draft horses from England until they are a glut in the market and the same is the case with thoroughbreds. All the shipments of horses sent from this coast so far have been sold at a good price and more are wanted, so we hope that those Californian breeders who can afford the expense and who find the local market dull will pick out a nice lot and try to extend the trade of this State.

TRAIN FARM HORSES TO WALK FAST.

The *Breeder and Sportsman* takes an interest as well in matters that pertain to the breeding of good stock as in matters pertaining alone to sports. The breeding of good horses for farm work is of as much importance as the breeding of fast trotters or of good coach horses. And in the case of farm horses, as in that of the trotter, as much depends upon the training as upon the breeding of the animal. Defects in breeding cannot, it is true, be remedied in the training, but the best bred horse in the world may be spoiled in the training, either for the turf or for the farm.

Probably the matter of the greatest importance in the training of a colt for farm work is a rapid gait at the walk, and it is one of those most neglected. Colts are usually broken to trot, not to walk, and in their walking gait they are left to follow their own inclination; yet nearly all the work of the farm is performed at that gait. Breeding, of course, has its effect on this as on any other gait, but probably nine of every ten horses used on the farm might, by judicious training, have been taught, when colts, to walk at a more rapid pace. This question is of more importance than it looks to be at the first glance. An improvement of ten per cent. in the speed of a team at the walk, when the time of team and driver are reckoned for the day, the week and the year, amounts to a very handsome sum in the course of 365 days, and very often this sum would, had it been saved to the farmer, have covered the margin between an actual loss which he has sustained and an actual gain which he might have realized on his year's operations. Careful calculation and study will pay as well on the farm as in the business house, and the farmer who employs a number of men ought never to labor with his hands himself. He has profitable work to do with his head all the time, and if he neglects this to toil with his men he is "saving at the spigot and wasting at the bung."

A REMARKABLE CASE.

An unparalleled thing in this region was the death of two young hunters on Monday last by exposure in the marshes in Napa creek. Nothing of the kind ever occurred before in the marsh lands of this State, and it seems almost incredible that mere exposure could account for the sad result. The story, as told by the dispatch, is as follows:

John E. Dever and Charles C. Schaffer, two young men employed in the *Times* newspaper office of Vallejo, went up in the tules hunting Sunday morning. Nothing was seen of them until this morning, when their dead bodies were found on the beach at Mare Island, a short distance above the foundry. The first one to find the bodies was John Dever, the father of one of the boys. While searching he discovered a drifting boat, and in it the body of Schaffer, whose head was hanging over the side with the face resting on the water. A short distance from the boat, and in the water, was a decoy duck used by the hunters, and upon pulling it out of the water Mr. Dever brought to the surface the feet of his son. They were attached to the decoy by a line wound around the legs. Only one oar was found in the boat, but the guns and hunting outfit were all right. An inquest was held this afternoon, the jury returning a verdict that both came to their death from exposure, being frozen to death in the storm Sunday night.

The hunters were both boys, it seems, and the accident cannot be laid to liquor. It is more than probable that the boys got wet and cold sitting in the boat watching their decoys, and got in worse condition than they themselves supposed. One of them may have fallen overboard and been drowned, and the other lost his life through fright and exposure combined.

It seems strange, however, that boys in a boat should have lost their lives through mere exposure and cold. If they had been in blinds it would have been different; but in a boat they could exercise themselves sufficiently to keep warm. The occurrence has excited a great deal of discussion and comment in hunting circles as something heretofore unheard of among us.

EDITORIAL NOTES.

An article on "Judging the Age of Cattle," under the head of "Herd and Swine" in this issue, copied from that reliable agricultural journal the *American Cultivator*, incidentally refers to the suffering and trouble which are often caused by diseases of cattle's teeth. It is a mark of progress that equine dentistry is now recognized as a legitimate profession and such a dentist, recently established in this city, reports an encouraging run of custom. Whatever adds to the comfort of the animal reduces the cost of keeping, so that from a standpoint exclusively of dollars and cents it will be found profitable to look after the teeth of horses and cattle, as well as after their health in other respects.

Algona Colts.—We hear of some very promising colts by Algona in Tulare County. Among them is a bay, foaled April 26, 1880, called Ben Wade, his dam Bessie by Oakley's horse of San Luis Obispo, who was by David Hill Jr., Grandam by Prince Albert. He is a colt of very high form and fine action, and Dr. Moore has also a weanling by Algona from Bessie that is as fine as his brother. Can some of our readers inform us what the dam of the Oakley horse was?

We have waited patiently for some time to hear that the University students are keeping up the practice in the football field. There is room for more athletics in the educational course across the bay and it cannot take a better shape during the winter months than football. The Wanderer Club has given no sign of life so far this season and we do not hear from the Phœnix Club as often as we expected.

From all parts of the State come the cheering reports that the late fall of rain and snow has given an assurance of abundant harvests during the year of 1883. This is rare news to the horse and stock breeder. When feed is cheap stock fetch a good price and horses sell high. With feed scarce, horses are in little demand, poor men are forced to sell and the price drops to an unprofitable figure.

The Coming race between Haley and Masterson is exciting much comment both here and in the East. We feel confident that the men will make a record good enough to to show that our sprinters are as fast as our horses.

THE GUN.

Looking Ahead.—From the Idaho *Statesman* we take the following clipping to show that a move is being made in the right direction in regard to the preservation of fish and game in Idaho Territory though at present its fish and game resources seem inexhaustible. "There is no other Territory in the United States that posses greater natural advavtsges for fish and game than Idaho. The protection of fish and game is a subject that needs legislation. There is a wanton destruction of both, and we ueed carefully prepared laws on this subject. The fact may not be realized by many, but it is nevertheless a fact that our game and fish are being depleted, when they ought to supply us with a great deal more food. This would be the case if we had sufficient laws that were rigidly enforced. It is a matter which should be handled advisedly. There are men in our community who know and understand this question, and their advice on the subject is well worth obtaining. In some States commissioners are appointed to protect and foster those interests. With all the natural advantages which we possess we should endeavor to protect and increase these sources of food as far as possible. Legislation cannot take hold of the matter any too soon."

One of the Tricks of the Trade.—A characteristic story is related of a certain English maker, famous in both hemispheres, alike for his excellent guns and his affable manner. On one occasion a lord of more pretensions than skill as a sportsman returned a gun with the request that it he altered in stock to fit him, as he had failed to do good shooting with the piece. Well knowing that the fault was in his lordship and not in the gun (which was made to order) the manufacturer decided upon a plan of action. Assuring the eccentric nobleman that all should be made satisfactory, the gunmaker simply laid the fowling piece aside, and after some delay produced it for the inspection of the sportsman. His lordship was delighted. The gun was vasty improved in his critical (?) eyes. "Why, dye know, it's exquisite, my dear fellah; how did you do it so, my friend?" observed the mighty nimrod. With a knowing wink the maker replied: "Ah, it's one of the tricks of the trade, my lud; one of the tricks of the trade."

Something New.—A shooting match, novel to this coast, will take place on Sunday, Jan. 14th, between Officer P. D. Linville of the San Francisco police and Mr. James M. Brazell, Secretary of the Bullion Mining Co. In this match three weapons will be used, the rifle, pistol and shotgun. Each competitor will shoot twenty-five shots with each firearm; the rifle at 200 yards, the pistol at 30 yards and the shotgun at pigeons with 21 yards rise—the pigeon match to be governed by the rules of the California Sportsman's Club. Each "dead bird" will count five points. This part of the match will come off at Bird's Point, Alameda, and the rifle and pistol shooting at Shell Mound Park. It will be an interesting match as both these men are good shots. This match is for a $200 gold medal. The Linville-Brown rifle match takes place to-morrow at Shell Mound Park.

Saturday evening two young men hired a boat at Fred Berryman's ark, in McCloud's lake, to go hunting in the tules the following day. Since then they have not been heard from, and the boat cannot be found. The supposition is that they were lost in the snowstorm of Sunday, and perished with cold. Berryman did not know their names and nothing of them other than they said that they lived in Stockton.

They have some extraordinary marksmen in the region of Sierra valley. The *Leader* tells of a couple of these nimrods who while out shooting the other day ran across a large buck which was stone blind from the effects of an old wound. After firing twenty-five shots at him, only one of which grazed him and that only in the tip of the right ear, the valiant sportsmen killed their game with a club.

During the snow storm the ponds of the Alameda County Sportsman's Club at Mallard Station was actually filled with water fowl of all kinds seeking shelter from the storm. Mr. Kelly the keeper killed 22 teal with a double discharge of a small Fox gun and over 40 in four or five shots.

How extensive the execution is which market hunters do among game may be learned from the record of S. Payne, a hare-shooter of Merced. During the last two months he has killed from seven to ten dozen hares a day and has sent 1,800 to the San Francisco market.

Messrs. Stack, Hoefling, Spencer and Dr. Card last Sunday were down at the Alviso marshes and found plenty of game, but it was so cold that the fun of hunting was spoiled. However the hunters succeeded in bagging 115 ducks before their return.

Three hunters who camped in Trinity county last summer hoasted of killing 100 deer in two days. Hounds were used in the hunting until these animals were nearly all driven from the region. The hides netted about four bits each.

A very cold-looking lot of hunters showed up on the ferry boats Monday evening and Tuesday morning. Several of the parties looked like remnants of an Artic expedition. A sorry-looking set of dogs accompanied the hunters.

The Sacramento *Bee* says: "An Oregon sportsman claims to have lately killed a snipe weighing seven ounces." It wasn't a snipe; it was only a Stockton mosquito that had gone north for fresh feeding grounds.

Chas. Green and J. L. Ziggler last Saturday were up at Duncan's Mills, and returned with six fine salmon, the result of a few hours' angling. These fish weighed about twelve pounds each.

Harry Kelly, keeper of the Alameda County Sportsman's Club grounds at Mallard Station, has returned to his home in Humboldt. Mr. F. E. Hale has taken his place.

They have had very good shooting at the upper end of Union island this season, compared with what people have had elsewhere.

There are large flocks of ducks in the lower bay, and around the seawalls of Oakland creek they congegate in great numbers.

Sherman island shooting this year has not been very good.

Deer are plentiful on Bear Mountain, Calaveras county.

Ducks are plentiful in Solano county.

Theories in Shooting.

It ie the earneet wish of every wide-awake person of nimrodic temperament to develop himself into an expert wing shot. This ambition is a perfectly natural and an exemplary one. Snceeeding this manly desire comes the question of the most expeditious and efficient way of accomplishing that end. When the yonug or inexperienced candidate for shooting laurels has looked over his inherited gronnd work and found his mind and heart in perfect sympathy with his wish to become a good shot, he is at a loss to know how to proceed. He knows full well tbe usual way is to practice incessantly for years, and even then some men acquire little or no skill. He concludes to epitomize this long course hy appropriating some one else's theory for bis guide and to slight his own natural endowment. I believe we are all too willing to slight our own theories and worship some other man's. We court theory too devotedly and in many cases we slight onr practice very shamefully. Practice develops into perfection what theory organizes. I admit that practice, enlightened by a little theory (one's own'), hrings prohciency sooner and much useless labor is saved. Theory can achieve nothing without the aid of practice, while practice is not so positively dependent on theory. Too much tbeory may retard one's progress and be otherwise detrimental, while there cannot be too much practice if mastery is the goal sought for. "Practice makes perfect," is an old adage, but nevertheless a true one.

Theory at best is but the vain imaginings of some brain as to how a thing may be done, while practice is the act of applying it. A plurality of machines may work on the same theory, and in this respect they widely differ from a similar number of men engaged in work, for each of the latter invariably has a distinct theory of his own as to the better way to do it. I doubt, most emphatically, the propriety of embracing any man's theory when we can acquire one of our own and the one designed for us. Apropos, if all men's muscles, nerves, etc., were precisely alike, I would yield a point. Theoretical men try their best to promulgate the idea that correctness in aim can be easily acquired by obeerving their infallible rules, which is really absurd. If obstinacy impels the heginner to give no heed to timely warning, and if he wishes to become a servile thief and steal someone's theory, whose shall it be? Perhaps that of Mr. A. Kleiuman, of Chicago, is selected, and he will find that that reorganized expert, with great emphasis, declares his sincere belief that no man can become a successful shot who does not "hold on" flying birds. Perhaps, dissatisfied with Mr. K's theory, he adopts Bogardus' experience for his guiding star, and he will find that that great gun says no one can—even by the slightest chance, otherwise from shooting away ahead—kill a bird if it be in motion. When great shotgun authorities like these disagree so widely, the yonng nimrodic disciple begins to think for himself, as he ought to have done from the beginning.

I sincerely believe that no geueral rule can be given for wing-shooting; and moreover, I do not believe any two men shoot alike. Within a few months I have read at least twenty-five articles written by men who had mastered this perplexing art, and no two were in anywise similar. "Then how shall I proceed," queries the confounded man, "to become a good shot?" The answer is: "Acquire a theory of your own, and practice—practice." If one has no clearly defined theory to begin with, intuition will teach him to point his gun toward the bird and blaze away, and by repetition of thie simple act a theory will be formed before one is aware of it, which will be the one nature intended for him. If you were desirous, dear *Bee*, of hecoming a practical duck-shot yon wonld go into the swamps and practice, and not by theorizing by your warm fireside. These theoretical men are gentlemen who, through fortnitous circnmstances, have become "crack shots;" and, being intelligent men, are very smooth writers. They are indisputably philanthropic, and they rush into print with their experiences for the express purpose of benefiting the yonnger portion of the fraternity by their advice. But oh, how they torture us (for we are keenly sensible to the fact of our own inferiority of aim) by forever referring to the great skill they have attained. Kind nature has endowed ns with the instiuct, and instinctively should we shoot. He who tries to divorce us from the theory intuition has tanght is an usurper, bent on stealing nature's designs. Experience, theory (one's own) and instinct combiued teach man proficiency in the use of the gun, and not man's hints to his fellow-man. I believe that constant observation, earuest perseverance and habitual practice will do more toward developing the shooter, away down in the rudiments, than tons of theoretical writing.—*Spoonbill, in Sacramento Bee.*

A popular pastime is to go down upon old Alameda wharf and shoot ducks. The birds are coutinually flying, aud are easily killed as they cross the wharf, if the marksman is expert. Care has to be taken to shoot them so they will fall to the "tideward" of the wharf. If the tide is going out they mnst be made to drop on the south side; if coming in they mnst fall on the north side, and then they float under the tressel, when they are picked up by nets on the ends of long poles. Those who have dogs willing to work under the nnfavorable circumstances may shoot regardless of the tide. Dave Chisholm has a dog that has got the business down to a fine point. When he seee a duck fall he takes a runniug jump from the wharf and lands in the water about ten feet away from the piles. He then brings the ducks, and putting his pawe upon the slanting braces of the piles, calmly awaits the ceremony of being hoisted up on the wharf again. A nooeed ropc is lowered over hie head, and if there is any difficulty in getting it in place he will assist by poking his nose through it. Then when they are ready to pull, Dave will sing out, "Now, get ready!" and the dog will draw in as long a breath as his lungs will hold, when he is swiftly pnlled up and landed on deck, and the uoose hurridly unloosed.—*Bee.*

A correspondent at Gridley, writing to the Sacramento *Bee*, poets the city people who like wild goose meat, to be careful in buying, "for it is a fact there are hundreds of thousauds of geese crippled in the tulcs every year. The correspondent trnly says that the inexperienced huntere and boys cripple more than the regular hunters. It would be an easy matter for unhealthy geese to be shipped below, and the one who sent them bardly be aware of it. The correspondent says that at times he has seen conduct on the part of hunters that good, law abiding citizeue do not practice. A hnnter was recently beard to remark that some of tbese geese he was shipping 'were good enough to feed tbose San Francisco fellowe on,' hut he wouldn't eat them." Commenting upon the foregoing the Colusa *Sun* thus disrespectfully refers to the average San Francisco appetite: "Tbere may be a great many geese crippled by the boys, but we hope they will keep banging away at tbem. They destroy more than would supply all the city people with meat and bread. And those city folks only eat them as they do jack-rabbit—because tbey are game."

The [illegible] no sportsmen are beginning to awake and threaten [illegible] violators of the deer law.

SMALL GAME REMINISCENCES.

A Rabbit's Shrewd Method of Evading Capture—Squirrel Stories—All True of Course.

"I tell yon what, boys, they ain't a brush lot nor a scrub oak clearin' fur twenty miles round that ain't more'n bilin' over with rabbits, an' squir'ls is thicker'u seeds in a cowcnmber," said the old settler. "Yit, h'gosh, ev'ry other feller you see with a gun is goin' out arter them pesky thieves of the valley, the ring-tailed coon! A hnntin' coons, when they mowt be a havin' genuine sport 'mong the squir'ls an' rabbits. B'gosh, boys, it makes—me—sick!"

It seems that there mnst be something all the while to worry the old settler. Job and Mag Streeter, the seven yonng Streeters, and the yellow dog had only just finished their visit at his honse, and he had so far recovered his wonted good nature as to insist on having someone "jine" him when he "slnng his apple juice under his surcingle," when one of the boys with a gun on his shoulder came into the Crissman house and let out that he was going after coons. It is a well-known maxim of the old settler's that "anyone ez'll hnnt coons 'll steal chickens from a blind nigger," aud even to mention coons sets him going.

"Go an' hunt yer coons, dot rot ye!" he continued. "Go an' bring 'em in by the cart-load if ye wanter! Git all the fun ye kin out'n huntin' 'em, for I tell ye, b'gosh that when Gahriul blows, an' ev'rybody's standin' 'round waitin' to see which place he's goin' to get a pass to, it'd a ben better for de coon-hunter if he'd a had a mill-stun 'ronnd his neck, an' ben sunk so durn deep in the bottom o', the sea, that he couldn't a heered the trumpet, I'm tellin' ye!"

The sheriff being an old coon-hnnter himself, and having been out only the night before and brought in three, changed the snbject.

"You may think squir'ls are pretty thick this fall, but when they're so thick that you have to carry an umbrella every time you go into the woods to save yourself from being pelted to death hy the showers of nuts the squir'ls drop from the trees, then I rather think the abundance of sqnir'ls is worth mentioning. That's the way it was np along the Lackawack in the fall of '57, major."

"They must a ben durn good hnntin' 'long the Lackawack that year, sheriff," said the old settler, "an' if you kin shoot as well as you kin lie, I don't believe you could pnt the sqnir'ls you killed that fall into a ten-acre lot with no fence around it."

"Good hunting?" said the sheriff. "Well, yes; I think that if I remember right, major, the hunting was a peg or two above the average. I was busy that fall, and didn't get out after squir'ls but once, and that was way late in the season, when cold weather had set in, and the squir'ls had all gone. I went up in a piece of woods back of Lackawack and sat down on a log. I didn't get up once, and never fired a shot except into one tree, which was about thirty feet from where I sat. Well, major, when I had squir'ls piled np around that tree so that I couldu't see the middle of it, and had filled the space so that they began to tumble over on me, I felt ashamed of myself and got up and went home. I don't know exactly how long I was out, but I left the honse in the morning as onr hired man was going out to milk the cows. When I got back home he was just coming from the barn with the milk, and we only had three cows, and the best one was only giving four quarts a day."

"Seems to me that was the same fall I saw a fnnny sight up along the Paupack," said the connty clerk. "Talk of squir'ls! The woods were more than full of 'em. They had cleaned out all there was on this side of the river, and made up their mind to forage on the other side. They started one day, and in less thau teu minutes the stream was full of 'em from bank to bank, swimming across. There had been a big freshet in the Paupack, and there wasn't a bridge left between Hawley and Kipp's. It played hob with the hnsiness along the river, for people couldn't get their lumber nor snpplies from either side of the river to the other, and one or two men thought they'd have to fail. The day the sqnir'ls were moving, a peddler's wagon came along. The peddler was a stranger, and he drove right along to where a bridge had gone away, and never noticed it, hut just kept right on across the river on the backs of them squir'ls. It took the squir'ls three honrs to all get over, hut by that time more than a hundred wagons had crossed, and the business went on booming again. That must have been the same fall, sheriff."

"There ain't a consarned doubt of it, b'gosh!" said the old settler. 'But that wasn't the same year that there was only one rabbit in this hull durn county, my smart rooster. That's somethin' ye don't remember, none o' ye. That was in '43, an' I kin tell ye it took huntin' to get that bob-tailed little puss. They never had been a season afore but what rabbits was thicker'n setters in a Jersey tavern. Bnt that fall you couldu't start one any more'n you could start a hear's tooth with a pair o' tweezers. I hunted three straight weeks in all the best rabbit deestricks they was, but nary a rabbit did I see. The first trackin' snow that come in December I started out, bound, b'gosh, to find a rabbit if there was one in the county. I lived back o' Dingman's then. Over on the west side o' Little Log Tavern pond I strnck a rabbit's track. I'm durned if it didn't skeer me. I had to set down for ten minits 'fore I could start an' foller the trail, au' when I did start it was with the idee o' follerin' it till I got that lonesome little scrub-oak mule if it took me till spring. The track led me more'n four miles through swamp and brush, an' over the conearndest hills that ever I clum. Suddenly, b'gosht 'lmighty, the track stopped plumb in the middle of an open space ten rods squar'. They wa'nt nothin' but an ole ches'nut tree on the openin', an' that were thirty foot from whar the track ended. 'Twa'n't nothin' but a rabbit track, boys, but to have it come squar' to an end in plain open sight, ten mile back in the wood from no place an' night comin' on, I kin tell you that it looked durued spookish, an' I says to myself, b'gosh, says I, I'd a durn sight ruther that track were a big he bear a-standin' thar ready to buckle inter me.

"But I didn't calc'late to give it up that way. I went all arouud that openin' tryin' to find out whar that track begun agin, but b'gosh, it didn' begin nowhar. They wa'n't no place to be seeu whar the rabbit could a hid, an' I begun to wish I were back to hum, gittiu my night's stovewood. I'd often heerd of epooks, but I never expected to have anything to do with one, 'specially in the ehape of a dodrotted uo-tailed rabbit. But, spook or no epook, I made up my mind to see the thing out. I built a fire over on the edge o' the woods and fixed things to stay all night. Durin' the night there come about an inch of new snow. Soon as it got fair daylight in the mornin' I was up to investigate. Now, if I was kinder flabbergasted the night before, I was clean gumswizzled that morning when I seen the rabbit track start just as sudden ae it had ended, about eixty foot from its stopping-place the night afore. But I started to follow it, b'gosh, on the double quick. Two mile on it crossed a big poud. I knowed the ice wouldn't hold me, an eo I had to go clean around, more'n a mile. When I got to whar the track came out on t'other side, I found, b'gosh't'lmighty, that the rabbit had changed his mind arter gettin' acrost, an' had turned an' gone back agin. By this time I begun to get mad. I cnssed an' tore awhile, an' then took my back track around the pond. The rabbit were makin' plumh back t'wards the openin' where he playd the spook on me the night afore. I hadn't seen hide nor hair o' the little cuss yit, an' cussed myself from a to izzard fur not fetchin' a dog along. Well, sir. b'gosh, that track led right to that openiu' in the woods again, an' ended just as suddint as afore.

"That durn rabbit's charmed," says I, 'an' I'm gummed if I'm goin' to waste any more shoeleather on him, b'gosh!'

"An' so I p'nts my nose fur hnm. I had jest got in the edge o' tbe woods, when I kinder turned an' looked behind me. I jumped more'n ten foot; fur agoin' helletyhoot back towards the pond agin were that cnssed rabbit. I pulled and whanged away, an' thongh, b'gosh, he wa'nt more'n half a shot sway, I never tetched him, an' afore I could get in on him with my left bar'l he were ont of all kind of range, and lookin' no bigger thau a snowball.

"Now, I know'd rabbits once in a while were dnrn cute, so I jest made up my mind that this nn had some reason or other for seekin' this openin,' an' concluded to hide an' wait. I waited more'n two honrs and was just going to give np in disgust, when a peekin' out from behind the tree whar I was layin' I see the rabbit comin' a lopin' along about a qnarter of a mile away. When he got within about thirty feet of the chestnut tree in the openin' he stopped, and lookin' round cautiously for a minit, scrooched down on his haunches an' gave a spring. The rabbit shot through the air like a ball out of a gun towards the tree jest as he sprnng, and he skittered about a foot out'n his course. That brought his head ker plunk againt the tree, an' he tnmbled on the snow. I picked him up. He had broken his neck, and were as dead as a stone hammer. Then I see what he were up to. They was a big hollow place on both sides o' the tree. He was cnte enough to know that by taking a long leap and shootin' inter them hollers from either side he could throw anybody off'n the scent ez were follerin' him. That were the only rabbit that 'were killed in the country that year, and I allus believed that he skittered out'en his course when he see me that day, and committed suicide rutber'n be killed."
—*Canadian Sportsman.*

Human Development.

While the steady march of improvement has produced many marked changes in the qnality of our domestic animals, the intelligent stock raiser being ready to contract—if time is allowed—for the production of a horse, for example, of any desirable color, form or speed, it is strange that a corresponding interest in the development of the human species should not exist. We acknowledge laws for the brute creation, laws by which definite results may be secured, by obedience to which soundness and health can be attained, as certainly as a good crop may be produced by the use of good seed, soil, tillage, etc. We feel almost sure that proper care, in all respects, will produce definite resnlts, and those of a favorite character. If a cow, for example, is bnt half fed, never protected from iuclement weather, we are not surprised that the milk is poor in quality, reduced in quantity, and that she soon pines and dies. We never think of attributing such an event to a "mysterions dispensation of Providence," for we perceive the relations of canse and effect.

But, in relation to man, it would seem that most persons regard him as ontside the pale of the law realm, a creature of accident, so low in the scale of heing as not to deserve the sanctions of law. With some persons, at least, his sickness is an inexplicable mystery. His lungs, as it might seem, are never affected by foul gases; his stomach by improper food; his nerves by the deadly poison of tobacco or ardent spirits, or his muscles hy abuse. I cannot bnt regard health as a commodity, prodnced with the same certainty and exactness as a pair of boots. We may make muscle with the same certainty in the man as in the horse. And, since muscle or physical stamina, when in a vigorons state, must be the basis of the best condition of the mental and moral being, it is of the utmost importance to lay well the fonndation. And, since it is utterly impossible for the mind and soul to exist "at their best," in a sickly, putrid body, surrounded by pestiferous gases, filth and foul odors, living in dark and damp cellars, breathing nothing to pnrify, eating nothing to make good blood, it is of the nmost importance to turn our attention more to man, the highest in the scale of being, as God made him, giving less attention, relatively, to pet dogs, canary birds, and the like. If we would have good muscles, saturated with electric force, firm, able to endnre labor, capable of resisting the effects of climatic changes, they mnst be nourished, fed with muscle food, properly developed by labor and rest. If we would have sound lungs, we mnst allow them more space than corsets and Parisian plates would encourage. If we would not have a part of the 600,000,000 of air cells closed, by undue pressnre—in tight lacing—we must be much in the pure air of heaven, exercise freely, having no garments or appeudages to prevent the free action of all the mnscles. If we would have pure blood, as one meaus, we must breathe our quota of the air, so bonntifnlly, if not prodigally frrnished by the great Father. If we would have good digestion, a normal stomach, as the most important means of securing strength, we must nonrish the body by the nse of plain, simple, nourishing food, easy of digestion, taking such food at stated and regular times, allowing the stomach about the same time for rest that we accord to other muscles. In short, we have simply to obey the laws of our being, the laws of God. We may improve our condition from age to age, so far as I can see, without limit. In our best state, more than half of the present sickness may he prevented.—*Ex.*

The Origin of Wheat.—Evolution claims at length to have solved the problem of the origin of wheat. The noted botanist, Grant Allen, says: Wheat ranks by origin as a degenerate and degraded lily. The primitive ancestor of the lily was a very simple plant, with a triple set of ovaries and three triple sets of pollen-bearing stamens, fertilized by insects. It thus acquired petals, varied by selection, until they acquired those bright colors and beauty which rivaled "Solomon in all his glory." The development was through many etages, through the alesina and marsh arrow grass aud innumerable forms nntil it reached the perfect lily. The first downward step seems to have been self-fertilization, taking the place of insect aid. Afterward the winds bronght the varied fertilizing pollen dust, and so came the rushes, plain little lilies with dry, brownish flowers; then the wood rushes, something betweeu the true rush and the grasses. The Euscaulon, a common American water plant, rushlike in character, bridged over the gap hetween the rushes and the grasses, and then step by step the changes in the parts of the flower culminated in our wheat plant. With the woodrushes commenced the habits of storing gluten and starch along with the embryo, which has made the cereals so valuable for human food, and raised our wheat, the descendant of the lily, the queen of the floral world, to the rank of the prince of graine, hearing its princely sway upon all the golden harveet fields of every civilized race aud nation on the globe.

THE KENNEL.

Coursing in the East.

The Eastern people are commencing to wake up to the delights of coursing and propose to emulate the clubs of California in that sport. The initial steps have been taken. Mr. H. W. Huntington writes to the *Turf, Field and Farm* as follows:

Referring to your article which appeared in the issue of the first inst., relating to the formation of a coursing club, I would like to supplement what you wrote with a few remarks upon the subject.

Early in the fall I made a public appeal to all owners of greyhounds not to allow their dogs to play the part of the French poodle, but rather put them on their mettle and show them to be of some worth. Those gentlemen who keep greyhounds simply because they are beautiful and pleasing to the eye are perfectly welcome to do so; but it seems to me gross injustice to a noble animal to deny him his rights and privileges, to say nothing of following the instincts of his nature. Sportsmen and poets have sung the praises of the pointer and setter; how with gun in hand they start off upon the usual "glorious morning," their favorites bounding off with wildest joy at the prospect of a royal hunt, eager beyond control for the enjoyment of what to them was as great as to the hunter. Nor yet has the courage and ambition of these noble animals escaped their verse. By the inexperienced the greyhound in this country has been very much maligned and pronounced of no value, spirit or ambition, and never was the utter falsity of it more perfectly established than by an occurrence which happened to me the other day while giving my dogs a run.

We were out with my three sleek, think-skinned, tender-appearing greyhounds and two setters. On our way home we came to a bunch of brush that was covered with vines and cat briars, so that in fact you could see into it but a few feet. As we approached it one of the setters came to a magnificent point, and the second coming up backed her in most excellent form.

We stood perhaps half a minute admiring the whole scene, when the three greyhounds returned from their wanderings and came up to me. Feeling sure the dogs were pointing fur we ordered them on into the brush, while we held the bounds in leash waiting the appearance of "bunny." But she would not come out, as the setters could only enter the brush a few feet, and were then obliged, on account of the sharp cat briars, to give it up. Seeing there was no prospect of starting the rabbit out, we loosened the hounds, intending to continue our way homeward. But they were not of the same mind. They made one dash at the briars and through it they went, from end to end, from side to side, heedless of cuts and scratches. I then remarked to my companion that the courage of these dogs could never again be questioned after such a performance.

I do not wish it in any way to be understood that for one moment I want to question the courage of the setter, for I have owned and still do own some rattling good ones; but rather to show that the greyhound has no superior in that respect, and that though he may be treated as a pet his sphere of usefulness does not end there, and that he is capable of holding his own with any of his brethren.

The emotions of the setter when first she winds her bird till she settles down to a well-defined point is fully equaled by the wild, almost uncontrollable power of the greyhound, when, while walking in leash, he sees the prey jump right from under his very nose and dart off with lightning speed for some convenient cover. With them the love of the chase is an innate one, as natural as the taking to water of a duck, and so it appears to me that in making simply pets of the greyhound we rob him of his nature and dull his every perception. Therefore it is my constant, earnest desire to see full justice meted out to my favorite breed of dogs and have them hold in the public esteem the high place they are entitled to.

I received many letters from owners of greyhounds in response to my appeal, making inquiries as to who were our prominent owners, asking my views in regard to forming a club. The only feasible plan that I know of would be to have, say, twenty gentlemen organize a club, pay a fair initiation fee and monthly dues, and during the next fall rent a farm within fifty miles of New York, and on it put a thoroughly competent trainer and slipper. Such a farm as desired could be rented cheap, and the outbuildings turned into kennels, cook-rooms and storehouse. Here the members could send their dogs down and have them trained, conditioned and exercised, simply at the cost of the food, which would relieve the club of heavy expenses in the gratuitous keep of a large number of dogs. The keeper being a thoroughly practical man could easily handle twenty-five dogs and keep them in perfect condition, and, in case of whelping bitches, he could give them better care than can be obtained in the city. Pure milk, fresh vegetables, good meat and scraps would keep them in such condition as would enable them to be run at a week's notice.

Here also could be planted in good numbers the Western jack-rabbit and the English hare, and ere a season had passed the section of country for miles around would be sufficiently well stocked to enable anyone to have a good match at any time. Rabbits and hares are very prolific, and when protected for one season would supply the want so greatly felt.

It is very gratifying to me to know that at last a nucleus has been formed, from which may spring a club devoted solely to the advancement of the greyhound and the introduction into this country of the glorious sport of coursing over which all Britishers are so justly enthusiastic, giving to thousands an exhilarating pastime with all the excitement and pleasure that can be desired in any gentlemanly sport.

I am endeavoring to get some twenty gentlemen to join me in the establishment of a kennel where we can be assured that our dogs, when in practice, will have proper care. If any would like to join me in such an enterprise, I am sure they would be amply compensated for their outlay, and not only that, but would have such means at their disposal as would enable them, at little expense, to add a few more dogs of noted strain and blood to their string. Upon the farm spoken of there could be held weekly matches, not only of the members, but from challengers outside the club. These trials would not only be of great service to the dogs, but would be a source of infinite pleasure to the members.

Mr. Lotz, of Chicago, the pioneer in this country in raising greyhounds of noted blood and speed, has kindly offered me his services in assisting me to procure jack rabbits for my dogs. Feeling confident of the success of my desire to institute a series of trials here in New York, I wrote to the owners of some of our most prominent dogs, challenging them to run against my dogs on Christmas day in a friendly match. Without exception these gentlemen entered most heartily into my proposition, showing they were thorough and true sportsmen and willing to try conclusions with me, irrespective of results. The dogs that will take part in the trials are Nellie, Slingsby, Don, Clio, Doubleshot, Dorothee and some others. These dogs are so well known to the public as to require no comments from me. I hope to add to these some three more, and if the weather is propitious and the jacks arrive in time, we anticipate having a jolly time and hold the first series of coursing matches ever held in the East. The pleasure of this sport being once demonstrated, all that remains for us to do is to keep up its character and have every trial fair and open. Many thanks are due to our sporting papers, who have the interest of all sports at heart, for the generous way in which they have spoken of this truly royal pastime, and the support they have thereby given it."

A Ten-Tousand-Dollar Dog.

The fact that just over the river from Albany is established one of the most famous kennels in the world has too long been concealed from public notice. As the master and his visitor, a reporter of the *Journal*, approached yesterday the dogs in the yard adjoining the kennel barked and bayed like mad in recognition of his coming. Corralled in a spacious enclosure guarded with a mesh wire fence, the forty or fifty dogs were at play when the owner arrived. Each in turn poked his nose through an opening until fondly petted on the head by his master, whose touch they seemed to crave like a child its father's caress. The kennel itself is a building 85x40, put up in modern style, with a decided notion for architectural attractiveness. Inside it was found as airy and cosy as a well-kept cottage. Its builder seemed to have had an eye out for optical effect, convenience and comfort. A fire blazed with genial warmth in a little enclosed space apart from the stalls. These compartments were some ten in number, designed for the accommodation of between forty and fifty animals. Isolation is effected by the erection of stationary screens of wire. Each dog is assigned its place, and learns to know it as well as a boy does his cradle.

This was demonstrated when the keeper whistled the pack into the house. In they scampered like so many boisterous children, full of spirits and animal glee. One after another they filed into their proper stalls and suffered the doors to be shut on them. Rory O'More, the progenitor of the majority of the troop, alone retained his liberty. "Rory is never locked up, the guide explained; "he is a privileged character. He belongs to the family in the house, not to the kennel."

Canine pedigree, one may guess, is an expensive luxury, when a single animal, like the father of the tribe, "Rory O'More," is valued at a plump $10,000. There is not a drop of blood in his veins, however, which is not pure and free from inoculation. He is descended, on his sire's side, from the champion imported "Rufus," a winner of nine prizes at conspicuous exhibitions in this and the old country. His dam was the champion "Friend," a dog which carried off the first prizes from ten different bench shows, notable among which was the championship of the United States at the Minnesota field trials in 1879.

"Rory" made his first appearance in public as a show dog in New York under the auspices of the Westminister Kennel Club, in 1877. Although then only nineteen months old, he carried away the first prize from a host of competitors. On the same occasion a $250 cup offered for the finest specimen of a dog of any kind, including either native or imported setters or pointers, was awarded to the king of the Greenbush kennel. "Rory" was again on the bench at the shows given in New York in 1879 and 1880, at both of which he was the captor of the highest honors, being awarded the championship again the first year and the Tiffany necklace the second. —*Albany Journal.*

A Dog Show.—There has been some informal talk among members of the old S. F. Kennel Club, about getting up a dog show next August. A show well managed ought to be a success in San Francisco and good management in the light of past experience ought to be easily attainable.

Men of Business.

In a land where there is great intelligence and great industry, there will be great wealth; and this wealth must be kept moving, changing forms and places and hands. It must find new channels in which to flow, new markets to supply, and create new demands where no demand exists. In our country intelligence and industry have called forth new and important inventions, created a great amount of wealth and put everything in motion. The streams are harnessed and made to draw; the earth is dug open and made to yield fire and light and power for machinery; a greater number of tons of merchandise is annually moved than by any other nation; manufactories of everything, and machinery for changing the form of everything are everywhere set up. All this goes to continually create and call out men possessing a peculiar kind of talent, a peculiar natural endowment; and these constitute a distinct and a very important class—business men. In this class are included all who give their time and thoughts to a particular branch of business, such as bankers, insurance companies, merchants of all descriptions, capitalists, manufacturers, contractors, master mechanics, ship owers, and all who employ others to manage movable property. Modern cities are built expressly as business posts; ancient cities were built for defense. A modern city is built on a harbor, so as to be easily accessible to the ocean; ancient cities were built on the river, away from the ocean, accessible to fertile lands. Modern cities pay little attention to the question of defense, and ask no walls; ancient cities made this the great question. Hence our modern cities are the gathering points where business men congregate, and are the tunnels through which they pour the creations of human industry.

It would be difficult to know how much money is in their bands, or how much changes hands daily, to say nothing about the merchandise bought and sold on credit. This mighty tide is swayed, ebbing and flowing every moment. They have the power, by concerted action, to create a panic, to honor or dishonor a nation every day. There is no earthly power which is felt so quickly or so widely as the power that moves the circulating medium. Ready money is ready power; and the men who have all the money of a nation in their hands must be an important class. The ore that comes out of the earth, the coal that follows the ore, the products of all the factories, all the workshops, of all the machinery, of all the agriculture, of all the fisheries—in short, everything that can be raised from the ocean, from the land, everything that can be moved on the land or on the water, everything that human ingenuity and skill and toil can produce is in the hands of those business men. It may not be theirs, but it is in their hands. It is for them to manage. They may have all the machinery that human ingenuity can invent; they may have the best and largest ships that ever sailed; but they must change the form, and the place, and the value of all the property of the world. There is not a farm in the land, not an acre of ground, nor a cow, nor a sheep whose value is not affected by these men. Their honesty, capacity, activity, energy and skill make a nation prosperous or otherwise.

Let anyone go into an office where the patterns of a great machine-shop are drawn out of the brain; let him go through the calculations necessary to build a railroad or to build one great ship; let him sit down and study the markets thousands of miles off for the purposes of traffic; let him plan what fabrics will be wanted two years hence in a distant land and manufacture those fabrics; let him calculate the chances of war and peace in this and that part of the earth; in a word, let the man who thinks that the men of business have not a vast amount of intelligence, watch them as they roll the wealth of the earth from one quarter to another; as they change a dreary sand-plain into a great city; as they make the air and the water, the streams, the lakes, the forests, the oceans, the winds, and the very lightnings work in their behalf, and they will see that there is, and must be, a great amount of intelligence in this class of men. No class of men work harder, as a class; none strive harder to bear up and carry their burdens manfully than these men; and often the intellect is taxed to an extent of which few dream.—*United States Economist and Dry Goods Reporter.*

Last season in the East was a sort of "cutter season," as so much cutter talk was indulged in and so many cutter races were sailed. It hardly seems to us, however, that the cutter advocates could have been very well satisfied with the results aside from their having called attention to the rig. There was certainly no proof that the cutter could sail faster than the sloop, and, as far as comfort is concerned in the waters our boats are used in, the wide boat surely is the roomier type.

THE RIFLE.

National Rifle Association.

The eleventh annual meeting of the life members of the National Rifle Association of America will be held at New York, Jan. 9th.

General Molineux, the President, will review the work of the year 1882. In this address special attention will be paid to the late international military match, while suggestions for the future conduct of the National Rifle Association, and for the return match of 1883, will be presented to the life members.

The reading and adopting of the annual reports will be followed by the election of seven new Directors to fill vacancies caused by expiration of the terms of office of General Wingate, Judge Gildersleeve, Colonels Scott, Story, Schermerborn and McLeer, and the resignation of Colonel Olyphant.

The new year will be an important one for the National Rifle Association, and it behooves the life members to be extremely circumspect in their choice of new Directors, and before casting their ballots, to carefully consider the names placed in nomination, as to their ability regarding time and their willingness to perform the duties required of them.

In the early days of the association one or two of the active Directors selected the candidates, and opposition, if any, was too weak and unorganized to be effective. The National Guard next took the management in hand, and by combined efforts secured a sufficient number of votes to carry their point. Unfortunately, however, many of the men thus elected seldom reported at meetings of the Board of Directors, or performed duties assigned to them as executive officers or committee men. They quietly dropped out, and their places were filled by the Board without the consent of the life members. This inside election is, however, perfectly legal under the constitution and by-laws of the association.

Military rule was not appreciated by the short and long range marksmen, and a combination was made, by which the military, in part, gave way to the small-bore element. This was a point not lost on the Directors, and last year they formed themselves into a close corporation, nominated candidates, presented printed ballots, and, naturally, elected all of their nominees, the opposition, though strong, being unorganized. We do not desire to criticise the individual actions of members of the Board of Directors of the National Rifle Association, but if the life members would consult the roll-book of the Board they would readily satisfy themselves as to how the accepted duty of the Directors was performed.

This year there are likely to be three parties in the field. The first to be selected by the committee from the Board of Directors, the second by the short and long range small-bore men and the rifle clubs, and the third by the National Guard.

Among the names thus far mentioned for election are General Wingate, Judge Gildersleeve, Colonels Scott and Story, of the present Board; F. J. Donaldson, Dr. Wright, A. J. Howlett, H. F. Clark, J. W. Todd, Dr. Habirshaw and L. V. Sone, of the small-bore clubs; and General Fitzgerald, Colonels Cruger, Clark, Rodney Ward and H. S. Jewell, Lieut.-Col. Palmer, Major Duffy, Adjutant Rand, Captains J. L. Price, A. T. Decker and J. M. Jarvis, of the National Guard.—*New York Spirit of the Times.*

The year of 1883 promises to be one of the most important in the history of the National Rifle Association and of rifle practice in general, in America. The defeat of our riflemen at Creedmoor in September last cast a damper on the rifle movement, which will require a strong effort to throw off, and it behooves every rifleman in America, and every friend interested in the education of our State and National troops, to put their shoulders to the wheel, and by encouragement and advice aid and assist the officers and directors of the National Rifle Association. America, without doubt, has procured a rifle which, in the hands of good men, will prove fully equal to the best ever produced in the British Isles, and if our men will come to the front a team can be selected which will do honor to American marksmanship. The rifle and men will, of a certainty, be forthcoming, but in our efforts to recover lost laurels abroad, we should not lose sight of our interests at home, and on the directors of the Association must rest either the progression or failure of the National Rifle Association. There should be no drones in the hive. The annual meeting of the life members of the N. R. A. will be held in January. To these life members of the association is given the power to choose for good or ill, and if the men elected to fill the vacancies in the board are merely chosen for the glory of the position and with little intention of performing the duties of the office, the life members will only have themselves to blame.—*New York Spirit of the Times.*

The National Rifle Association has a letter from the British Association announcing that in the coming match the use of a wind gauge and permission to change entry will be conceded, but no change in the shape of the ha[illegible] sight will be allowed.

ANCIENT AND MODERN ARMS.

Theories Regarding the Rotation of the Bullet in its Flight.

BY DR. E. H. PARDEE.

(Continued from page 379, volume 1.)

Having described in my last communication the method of different rifling as promulgated by the individuality of each inventor, I will now direct my attentiou to the turn given to the rifle, and I am forced to say too little importance has been given to the determination of the turn or pitch of the grooves. This, until the days of Hutton and Robins, was never reduced to anything like a mathematical calculatiou. These gentlemen have left behind them the result of their experiments and deductions so plain that from their day and from their mechanical calculations there has been almost a constant strife between individual intelligeut mechanics and national emulation as to who could first catch the golden prize by giving the proper spiral to the grooves, with the proper fitting of the ammunition to the same—a point upon which, in reality, failure or success will always depend. But one would naturally give au opinion, based upon the marvelous performance of our present era of gunnery, that everything that the human mind could bring to bear upon this important subject had already beeu brought into requisition. But with all our advancement it seems remarkable that no one has made and set forth the precise laws that shall determine the size of the rifling, with its caliber and length of projectile for different distances; for, however mucb the sentiments and opinions may differ on this head, it is clear to my mind that there must be some fixed laws, applicable to guns of every variety of caliber, by which this matter should be governed.

While I admit that there are those whose experiences have been more extensive than my own, still, from what I have seen and reasoned from cause to effect, I shall claim tbe privilege at least to respect my own opinions and deductions, although they may differ widely from the honest opinious of others whose researches and investigatious may have been far greater or even less than my own.

The first thing that presents itself to my mind is: What is the cause which renders a projectile of an elongated form more efficient when it has imparted to it a rotary motion toward a common center, when in the direction of its flight? All will say that the answer to this question is, that such a rotation enables the projectile to resist the deflecting power of the air better.

I do uot know that I can do better than to quote "Robins," which has been regarded as authorly on this matter:

"A bullet discharged from a rifle barrel is made to whirl round on an axis which is coincident with the line of flight, and, hence, it follows, that the resistance on the foremost surface of the bullet is equally distributed round the pole of its circular motion and acts with an equal effect ou every side of the line of direction so that this resistance can produce no deviation from the line. And (which is of still more importance) if by the casual irregularity of the foremost surface of the bullet or by any other accident, the resistance should be stronger on one side of the pole of the circular motion than on the other; yet, as the place where the greater resistance acts must perpetually shift its position round the line in which the bullet flies, the deflection which this irregularity would occasion if it acted constantly with the same given tendency, is now continually recitied by the various and contrary tendencies of that disturbing force during the course of one revolution."

I think Mr. Robins is correct as far as he has goue in this matter of rotation to the bullet, if he had added that the circumstances attending the flight of elongated projectiles show, however, that a rotary movement about an axis situated in the direction of its flight alone tends to keep the projectile in the plane of its trajectory, not altogether because the pressure of the air is there by equally distributed round the pole of the circular motion, but because the rotary movement gives stability and support to the projectile which enables it actually to resist the teudency which the projectile has, from the pressure of the air, to become unsteady, or to turn completely over in its projectile velocity. And, furthermore, I will venture to say that in order to obtain the best effect with a particular shot, a given velocity of rotation should be imparted to it which in the nature of the concomitant circumstances must not be the same with all kiuds of bullets.

Men have differed in their opinions regarding the cause of rotation being imparted to the bullet; some have argued that the rotary motion of the shot arises solely from its constrained passage along the grooves, formed in the barrel of the gun, while others believe that the grooves simply imparta first rotary impulse to the shot's flight by the action of the air against the projections upon the surface of the bullet.

In my opinion, it looks reasonable and in fact I have no doubt that the rotary motion given to the projectile is caused solely by the twist which it receives in passing through the barrel of the gun; and that the pressure of the air, so far from promotiug or assisting it in any way, must act continually as a check upon it in proportion both to the length of the shot and the velocity that is imparted to it.

The theory that the air imparts the rotation to the bullet is founded upon a certain supposed analogy between a bullet and an arrow; and how many attempts have been made at various times to place flanges or grooves at any angle to the plane of the elongated bullet, and fire the shot out of the smoothbore, believing that the wings would be so acted on by the air as to impart to it a continuous rotation until the projectile velocity had been spent!

A little study of the subject will conviuce any one that there is no analogy existing between the two.

An arrow is usually a rod of wood with some metallic substance on the point, which, when in motion, has little or no teudency to turn over, for two reasons: first, because the resistance of the air to such a motion is very great, owing in a great degree to the length of the shaft and its comparative small density; second, because the direction of the original impulse passes almost exactly through the center of gravity of the arrow, which cannot be the case in the leaden shot. Let us suppose an arrow beginning to turn in its flight; the impediment or resistance of the air would have a direct tendency to check such motion in consequence of the forward position of the center of gravity.

Most people believe that feathers on the arrow are placed in an oblique direction to the line of the hindmost part of the shaft, but such is not the case, for they would materialy affect the flight and range of the arrow. How often have I heard men talk to the contrary in their comparing the rotation of the arrow with that of the bullet from the rifle!

And I am led to believe that the action, cause and effect of the flight of the simple arrow are not correctly understood, resulting in a philosophical deductiou that by the breadth of the surface preseuted by the feathers, any tendency of the arrow to rotate about its shorter axis is checked and the steadiness of the arrow augmented.

Thus it will be readily seen that three feathers will have a greater influence in causing the arrow to steady up in its trajectory than two, as with three, in whatever direction the shaft moves, the flat surface of the feathers will encounter the resistance of the air; the feathers also materially give aid to the arrow following the career of the flight, so as to be a tangent to it quickly at every point.

To illustrate this arrow problem, let us take a leaden bullet, as long as the shaft of the arrow, with the center of gravity not thrown toward the foremost part of the shot, and fire it from one of our long range rifles that now have one complete turn in eighteen inches, and for want of greater rotary motion the bullet will begin to turn in the air before it has departed from its greatest initial velocity, and the shot will go screeching through the air in its evolutions, making a noise like a baby with a bellyache; and it is about as painful for a man to listen to one as the other. And it would be impossible to impart enough rotation to the long shaft of the bullet to keep it spinning on its own axis, for I find by mathematical calculations, to keep a shot turning upon its own center, that it would require a complete turn in every four inches, allowing the bullet to be twenty-five inches long. The angles of the grooves would be so short, or the turn of the rifling so quick that the projectile velocity would be too great for the shot to turn with the riflings and it would strip or pass directly over the grooves in a straight line.

This arrow business has caused many men to spend their time and money in trying to perfect some kind of a projectile to be fired from a smoothbore gun that would impart to itself the rotary motion necessary to keep it spinning on its axis.

I remember when I first moved to Oakland in 1867, a Mr. Potter was creating a great sensation among the natives of the town by getting in circulation a report that he had invented a breech-loading cannon with a peculiar kind of a projectile that was going to revolutionize the laws of gunnery. As a matter of fact, I became exceedingly anxious to set my eyes on the little joker, and after a while I succeeded in not only seeing but feeling of this wonderful weapon that could shoot the dog out of the moon and not in the least interfere with the revolution of that satellite around the earth. The cannon was about six feet long, constructed like any other cannon, largest at the breech, running toward a coue to the muzzle end of the piece, with some kind of a block and key to close the breech after being loaded. The caliber if I remember right was about three inches. The projectile was headed, cylindro conoid, about three inches long, and then on three sides equidistant, grooves were cut shaped like the letter V, running on an obtuse line from the plane of the shot, making three flanges for the air to come in contact with, believing that by the pressure of air coming in contact with these, the wings would press it over and cause it to have rotation upon its axis, coextensive with the projectile velocity of the shot.

These wings were about six inches long, so that the center of gravity was strongly located in the head of the shot. Well do I remember when I replied to the question "Doctor, what do you think of my invention?" the expression of contempt he had for me depicted on his face. My reply was a little rough, but graphic beyond all doubt. "'Tis not worth a d—n," and after a little repartee on both sides, I induced him to cool off and listen to my reason for the above answer. First, the air in front of the bullet is driven from its position in a direction at right angles with the course of the shot and as the shot is traveling at the immense velocity of two thousand feet a second, the atmosphere does not unite again till after the shot has passed through the vacuum thus created, therefore the wings on the tail of your shot are relieved from the atmospheric friction that you base your whole argument on. Second, if your theory could be correct the act of gravitation would cause so much greater atmospheric friction on the under than on the upper side of the shot that there must necessarily be a constant divergence of the shot from its direct initial point of flight. Third, that the construction of your shot is of such a character that the "windage" would cause you to have a perceptible and constant variation in the performance of your gun which of itself would make your gun valueless as a weapon on the field of battle.

The moral of all this was Potter got mad, I went home, and a few years afterwards I learned that the gun had been sold for its intrinsic value for "old brass."

I am free to confess that some fifteen years ago I too was infected with this arrow disease; and I had it bad, and nothing but a series of practical experiments brought the disease to a crisis, and gave me the knowledge, when I could diagnose and prognosticate a similar affliction of others. I made a number of experiments in a smooth-bored gun, with long shot, of which the front part was composed of hard metal, usually lead and metallic antimony, the hinder part of wood and other light material; and I learned that the resistance of the air prevented these shots turning completely over but a manifest tendency in the oscillating in the tail of the shot during its flight resulted in a low velocity; consequently a high trajectory. And it must be manifest to any one who has given the subject a little brain fodder that if the projections of the shot are sufficient to overcome the tendency to turn over, that must materially reduce the velocity and thus increase the expenditure of means. I care not how ingenious many of these inventions and creatious may be, how fertile the mind they emanate from, how devoted the individual may be to the gun, how often he may go to his target ground, and fire his one hundred shots from prepared ammunition, the facts will remain the same, i. e., unless the full power of ordinary shot, either with regard to velocity or range, can be obtained with them they are practically useless, and not worth the ammunition that they cost.

I have seen so much trifling with the laws of gunnery, by men who do not understand the real difference between a short or a long range rifle, that I am tempted to shout at the top of my voice "God have mercy on their souls."

A man may as well attempt to trifle with the science of mathematics as to attempt something new in the science and laws of gunnery without first educating himself and making himself somewhat conversant with the mysterious laws of gunnery.

A man may as well go to the blackboard and attempt to work out a problem in the rule of three without first learning the three principal rules of arithmetic, addition, subtraction and multiplication, as to attempt to solve a problem in one of the most abstract sciences that the brightest intellect is, and for ages has been, trying to solve. I received a letter a few years ago from a lad, who had gotten "letters patent" for a rifle bullet, and after getting the rigbt secured from all encroachment, he then began to make inquiry as regards the merits of his bullet. And with all due respect to this young cion, engaged in so noble an undertaking, I will quote a sportion of his letter.

"My Dear Doctor—I hear you are an expert on the rifle; I have invented a bullet and I think there are millions in it, and if you will furnish the money we will go in cahoots; and after reading my description of the bullet and you think it worth your attention, write me and I will call down and see you. Description of the bullet—The bullet is like that of Sharps long range only little shorter and beginning at the but end and running a screw around the whole length of it, or until you get to where it begins to slope off to the point. The screw when the bullet is in motion will screw in the air, like a wood screw in a soft piece of redwood. Don't you see my pint, and what do you think of it?"

I answered the lad's note, saying that I thanked him for his kind offer, and regretted to he under the painful necessity, wholly on account of my whole time being occupied in my profession, to decline his very liberal offer, that I hoped and trusted that be would have no difficulty in obtaining some one, without any trouble, who had all the means necessary to start so laudable an enterprise, and added:

"P. S. The only addition that I could offer to your screw patented bullet, is the application of sweet oil on the head of the bullet, as it would make it slip more easly through the air; believing that sweet oil and perseverance will make your screw bullet a complete success; I again subscribe myself,

"E. H. PARDEE."

The California Schuetzen Club, which numbers over one hundred members, among whom can be found the best rifle shots in this State, had an election for officers Wednesday at the Eintracht Society Hall. The following officers were elected to serve during the ensuing year: President, Philo Jacoby; Vice-President, C. C. Rholffs; Treasurer, J. H. Schulte; First Secretary, W. Hatje; Second, J. F. Sarranter; First Sbootingmaster, I. Rapp; Second Shootingmaster, J. H. Fischer; Trustees—E. Adams, J. Fischer, Philo Jacoby; Finance Committee—H. Zecher, Wm. Ehrenpfort, A. Bertelsen; Shooting Committee—A. Rahwyler, K. Krahman, D. Schoenfield.

The Feeding of Road Horses.

Eight years ago I began to practice medicine in the country and was advised by my father-in-law, a physician of thirty years' experience, to feed my horse but twice a day. The proposition was indignantly spurned; I ate three times daily; why should not my horse? At last prevailed upon, I made a trial of the system, and after some years' experience am more than satisfied. I can most heartily indorse all Dr. Page wrote in the recent article on "Horse Hygiene," and would respectfully submit the following rules for feeding road horses: 1. Feed as near 6 a. m. and 6 p. m. as possible; or in winter time at 5 p. m., if preferred. 2. Vary your feed in kind from time to time; oats, however, always being the staple. 3. Vary the quantity of feed according to the work. 4. Always put a small piuch of common salt in the feed. 5. Always shake the dust and settlings out of your hay, and use only a very moderate quantity. 6. Never drive your horse, if you can help it, until he bas stood at least two hours after feeding and watering, and never feed or water until he has rested at least one hour.

Now a few comments. Rule 1. Feed your horse in the morning all the grain he will eat clean; put in it a little salt. When he has eaten it, offer him a little hay—my rule is as much as I can pack twice into a water bucket. Too much hay bloats a horse and makes his wind short, and may produce heaves. Let your hay be clean, shake out the dust and pick out longer weeds. After he has finished his hay he may be groomed and watered, and two hours after he has had his grain he is ready for the road. His food has been at least partially digested, and passed to credit of the blood and thence to the muscular and nervous system; instead of a load of crude substances to carry, he feels an invigoration of fresh vitality supplied to bis system. Now, the horse so treated and driven upon the road needs no feeding until night; further, he is better not fed. If your driving at noon or near it offers an intermission, put him in the stable, take off the harness and let him stand an hour, then offer him water, and in an hour again rub him off, harness and drive on. Rule 2. We prefer oats as a basis. In summer a little cracked corn with it and sometimes a little wheat bran. In winter corn and oats are ground together (no rye) or a little flaxseed meal with oats is excellent. Oats make muscle upon the hips and neck, while feed (corn, oats and rye) makes fat on the ribs especially and produces less muscle and more heat than oats. Rule 3. If you jog your horse six miles a day he does not need half the feed he will if you push him hard forty or fifty miles, as I frequently do. I feed eight quarts every day, ten if the trips are many, and twelve or sixteen if very many and long. Rule 4. Salt is essential to the animal economy. No man can thrive without it and none would if "salted" once a week. Season the food for the beast as you do your own—a pinch in three fingers in every lot of feed. Finally, let him rest at night before you feed him at least one hour, and if he is very weary a two-hours' rest is better; then water and feed (I prefer my night feed a trifle to exceed that of the morning); this avoids all possibility of foundering, and the horse bas a better appetite.

SCENT OF DOGS.—Dogs not only smell odors in an occasional way, but they otherwise seem to extract a recognizable odor from almost everything, as Professor Croom Robertson also suggests. Anarchist knows me when I am dressed in clothes he never saw before, by his nose alone. Let me get myself up in theatrical costume, and cover my face with a mask, yet he will recognize me at once by some, to us, undiscoverable perfume. Moreover, he will recognize the same odor as clinging to my clothes after they have been taken off. If I shy a pebble on the beach, he can pick out that identical pebble among a thousand. Even the very ground on which I have trodden remains to him a faint memento of my presence for hours afterward. The bloodhound can track a human scent a week old, which argues a delicacy of nose almost incredible to human nostrils. Similarly, too, if you watch Anarchist at this moment, you will see that he runs up and down the path, sniffing away at every stick, stone and plant, as though he got a separate and distinguishable scent out of every one of them. And so he must, no doubt; for if even the earth keeps a perfume of the person who has walked over it hours before, surely every object about must have some faint smell or other, either of itself or objects which have touched it. When we remember that a single grain of musk will scent hundreds of handkerchiefs so as to be recognizable even by our defective organs of smell, there is nothing extravagant in the idea that passing creatures may leave traces discoverable by keener senses on all the pebbles and straws which lie across the road. Thus the smells which make up half the dog's picture of the universe are probably almost as continuous and distinct as the sights which make up the whole picture in our case, and which doubtless coalesce with the other half in the canine mind.

POULTRY.

Hen Lice.

"Eternal vigilance is the price of" freedom from lice in fowl houses. A great many poultry-keepers when they find their fowl houses swarming with lice go to work and clean them out in short order and then seem to think that the work is done for all time; hut the little tormenters multiply and increase with astonishing rapidity, and in the course of two or three months the inexperienced ponltry-keeper is astonished to find that his fowls have more lice on their bodies than ever.

If you expect to keep your fowls and their premises free from chicken lice, you must wage a constant warfare. The ounce of prevention in the shape of a proper place for the fowls to wallow in, and an occasional whitewashing and washing the perches with coal oil, is worth more than several pounds of cnre after the lice once get a foot-hold on your fowls; hut when they do get it, don't he discouraged, hut go to work faithfully until they are exterminated.

The plan that I have given repeated and thorough trials—and that has never failed me—is to whitewash the iuside of the houses every spring and fall, aud once or twice during the summer; to fumigate occasionally with snlphur; to use coal oil freely as a wash abont the perches and on the hodies af the fowls; to nse sulphur or tohacco stems in the nests, aud to always keep a supply of road dust and ashes where the fowls can wallow in at pleasure. After the dnst hath has heeu in use a month or six weeks, the hox is refilled with a fresh mixture of dust and ashes. Anoint the fowls every two weeks with a mixtnre componnded of five onnces of sweet oil mixed with one onnce of sassafras oil, and applied with a sewing machine oil can. Carholic powder is also an excellent remedy for lice on chickens, and to mix with the contents of a dnst box.—*Fannie Field in Prairie Farmer.*

Fanny Field and Games.

In your always welcome paper dated Dec. 2d, I find the following: "Will Fanny Field or some reader of the *Prairie Farmer* auswer a few questions in regard to game fowls?"

In Fanny Field's answer to the ahove it is plain to he seen that she owes them a little spite, prohably on account of that hen, snnbonnet and woman affair. Now I will speak a good word for game fowls. I have raised them for fifteen yeara. Have also had Cochin Chinas, Light Brahmas, Plymonth Rocks, and a variety of mixtures. In my experience, games are the hest layers of all fowls, giving the greatest weight of eggs for food consumed, and hest for tahle use, althongh not large. They have very plnmp bodies of the finest grained flesh of all poultry,' and "Good mothera? Well, yes." Fanny has given the facts that will apply to all games in that respect. The hens will make it lively for rats, hawks, dogs or persons that interfere with her family management.

My experience in chicken cholera is that last spring I bought twelve three-quarter pure Brahmas, hrought them home, and put them in the hen honse with my games; and in two weeks I buried the last one. All died of cholera, and lost only two of my games with it, and never any before or since.

For laying qualities Black Breasted Red I consider hest. They also have the brightest colored feathers. Games among fowls are like the race-horse among horses—the highest in hlood, most heautiful, hardiest and healthiest of their kind. I admit they are not the fowl for close quarters in town; bnt for the farm they are the best of all hreeds of fowls.—*Sim, in the Prairie Farmer.*

A mysterious disease has been making havoc among the ponltry owned by residents of this town. It is worse than cholera among human beings, being as sudden in its operation as strychnine or any other deadly poison. Fowls which have fed heartily the evening previons are found dead under their roosts the next morning, nor is there in the appearance of their bodies externally any manifestation of disease. Turkeys and dncks, helonging to the same poultry yards, do not seem to be attacked hy the malady. This we report from personal observation; nearly all the chickens on our premises have perished, some ducks and turkeys feeding with them having escaped entirely. Of nearly fifty hens and roosters ahout half a dozen snrvive at this writing and we hear of equal mortality in other ponltry yards. Coupled with this disorder we have ohserved that the nights of its extremest virulence were close and foggy and we are inclined to counect it with those atmospheric conditions. With the setting in of the rains, our opinion is, the disease will disappear.—*Monterey Democrat.*

There are people who think raising poultry and eggs for market is small bnsiness anyway; let all such meditate on the following figures: Orer 20,000 car-loads of live and dressed ponltry are carried into New York city yearly, and 25,000,000 of eggs go into the same market, According to the best estimates, the United States produce 900,000,000 of eggs annually.

The Duke of Argyle is accnmnlating the American wild turkey on his plantations. This shonld not be difficult, as English winters are mnch milder than our own, and the turkey is a hardy bird, nsually preferring to roost in trees in the coldest weather, rather than in close houses.

How to Feed For Eggs.—Always keep pure hred poultry, uot mongrels. Let your poultry have all the old lime, plaster, oyster aud clam shells hroken up, hurned bones, charcoal and gravel they require, a good dust hox to wallow in; plenty of good water—uot snow or ice. Sour milk is good, and is much liked by them. In the morning give potato aud meat scraps, hoiled aud mashed, and thickeu with corn meal and wheat shorts. At uight feed corn or huckwheat.

On the second moruing give a warm hreakfast of potatoes or the like; thicken with shorts, or oats and huckwheat ground together. Feed wheat screeniugs at night, and so on. They should have a warm meal of some kind every morning, and change the feed every day, and not feed steady one kind of food. Haug up a cahbage by the stnmp; the fowls will work at it until there is nothing left of it but the stump. Give them two or three times a week a little bone meal in their mash, also a little cayeune pepper. Keep them iu good warm qnarters, and clean and free from lice and other vermin. Pullets will lay more eggs in winter than old hens, if they are early ones—March or April hatch.

It takes a little louger to prepare the moruing meal than it would to throw a little corn in the snow or on the mauure pile, as a great many do, and then complain that they get no eggs. Follow these rules, and yon will have eggs to spare.—*New Southern Poultry Journal.*

Molting of Fowls.—When fowls are well cared for molting nsnally takes hnt little time compared with those uncared for, aud full of vermin as such birds usnally are. Some fowls rarely appear to shed a feather ont of season while others are continually dropping their feathers here and there, aud never appear in a perfect state of feather. These latter are rarely good layers, and are usually Asiatics and their crosses. They are generally infested hy vermin, that destroy the life of the feathers, and canse them to drop prematurely. If the fowls' hodies are kept clean, the feathers will he hright with good keep, and when the season arrives for the regular molt, the new feathers are ready to take the place left vacant by the worn-out dress; in a few days the hody is covered hright and new, the normal condition of the hird kept np and, in many instances, the egg production also. Molting usually occnrs in August and September, hut some fowls do not molt until into Octoher and Novemher. These fowls are generally the large layers, hut with good care and food they will pass through this season with small difficulty, if warmly honsed at night. They seldom make so strong or good hirds as those which drop the feathers at the usual period.

Breeding Geese.—In hreeding geese the snrplus goslings are killed off every year. None need he saved for wintering and hreeding except it may he well to keep one or two fine geese to take the place of old birds, killed or hurt hy some accident. Geese lay regularly, breed and rear their goslings well for fifty or eighty years and, it is said, they grow tougher every year. So if one has a good breeding goose, one which does her own duty well, and is reasonably peaceful toward other inhabitants of the farmyard, it is best to keep her for years. Sometimes a goose will he very cross, killing duckling and chickens, attacking children, etc. Such a one is a fit candidate for the spit. Ganders are generally mnch worse, and usnally one more than five or six years old becomes absolutely unhearable. So provision is naturally made to replace the old ganders every three or four years. It is hesides necessary to do so, for thongh a young gander will attend fonr geese very well, an old one confines his attention to one only, and often proves infertile at six or eight years old, getting crosser all the time.

Where fowls are fed regularly it is well to throw the food on the ground and let them scratch for it, since the exercise thns gained is heneficial.

The Cheese Markets.

The Utica, New York, Dairymen's Board of Trade held its last meeting for the season of 1882 in Utica, Dec. 4. The Secreary, B. D. Gilhert, presented his report, together with a tabnlar statement of the transactions of each market day at Utica aud at Little Falls, from which it appears that the dairy interest of central New York, while it has not hoomed with hops, has partaken of the general prosperity. The Utica market opened May 1, oue week later than last year and two weeks later than in 1880. The late opening was largely due to the high price of hutter, which led dairymen to make hutter rather than cheese. The opening price was twelve cents, or ½ cent lower than in 1881. The cold weather of spring and dry weather of summer were disconraging features, but profitahle prices were generally ohtained. The three heaviest days of the season were the three Mondays of July when sales aggregated 10,922, 9,476, 11,580 boxes, respectively. On nine days in 1881 the sales exceeded the heaviest of these. The secretary says: "It is worthy of notice that while cheese has not bronght as big prices this season as it often does, neither has it ruu down to a very low price. It has maintained a very even conrse all throngh the year, the average price being confined between the limits of 10¾ and 12½ cents—the lowest price not dipping below ten cents and the highest not going ahove fifteen cents. Last year the variation of the average price was 4½ cents." The only disasters recorded during the year were the failures of the houses of R. Perrin aud Snell & Co., ueither of which seriously affected the Utica hoard. The secretary's tahle of daily trausactions affords the following statemeut hy months, the figures under "sales" and "commissions" represeuting hoxes, and under "average price" the price per pound:

UTICA MARKET.

	Sales.	Commissions.	Average price.
May	17,363	5,052	11½
June	19,118	6,487	10 11-16
July	40,756	9,918	10 23-32
August	22,245	7,281	10 25-32
September	27,261	5,935	10 31-32
October	34,204	3,168	12
November	20,181	1,513	11¾
Total	181,137	39,356	11 5161

Total sales and commissions on Utica market 226,502 boxes, which at sixty pounds per hox gives a total of 13,230,120 pounds of cheese sold. Multiplying hy average price and we have receipts on Utica market during 1882, $1,523,593 85.

LITTLE FALLS MARKET.

	Sales.	Commissions.	Average price.
May	18,951	2,178	10 33-40
June	26,686	2,320	10 17-32
July	47,456	4,251	10½
August	22,747	2,652	10 27-32
September	29,729	4,290	10 29-32
October	35,836	1,548	12½
November	14,153	579	11 25-32
Total	195,357	17,818	11 4838

Total sales and commissions on Little Falls market 213,175 hoxes, or 12,790,500 ponnds, which at average price shows receipts on Little Falls market during the time considered $1,468,836 40. The cheese industry, as represented hy these two, the principal markets of the dairy region of New York, hrought to its patrons in seven months of 1882, $2,992,430 25; total receipts in the two markets last year, $3, 268, 950; in 1880, $3,800,436. The falling off this year is attrihuted to the late opening, the cold spring and dry snmmer, which rednced the flow of milk.—*Cultivator.*

A Grain of Wheat.

A "corn of wheat" is a little thing, but marvelously complex. Through the center of the kernel runs a groove, so that a horizontal section is heart-shaped. Under a glass we see that it is very composite in structure. The ontside layer or cnticle, which forms the brau, is composed mainly of silex, the mineral hase of sand, which hy means of the potash iu the soil is made solnhle, and is carried by the little veins of the wheat plant and deposited with the woody tissue. The nutriment in this triple coat is not digestihle hy the hnman stomach, hut is excellent for cattle. The layer next inside this is styled glnten. This is a complex snhstance and in the highest degree nutritious, especially to the mnscnlar tissnes of man. Glnten pure is composed mainly of protein, which is the basis of the nitrogeneous compounds, alhumen, fihrin and casein, with a slight addition of sulphur. On this layer depends largely the nntritive valne of wheat. When flour stands for some time after grinding some of the gluten changes its form to alhumen, and thus impreves its hread-making qnality, so that the haker considers flour a month old hetter than that fresh ground. This substance is not strictly limited to this layer of the grain, bnt is fonnd in the hran and distrihuted throngh the starch.

Within this gluten layer lies the starch, constituting the mass of the kernel. The starch consists of minute granules about .002 of an inch in diameter. The nnclei around which cluster these tiny grauules some think are gluten. This is certainly true of oats. On the mingling of the gluten with the starch depends the valne of wheat for making hread. For, besides the protein, crude glnten contaius sugar, gum and soluble alhumen. The decomposition of sugar in fermentation produces carbonic acid, which hecomes eutangled in the tanacious gluten, expands in the heat of haking, and reuders the loaf light and spongy.

Iu the center of the kernel, where the outer layer turns into the hody and doubles arouud, forming an inner heart-shaped section, lie the phosphates of soda, lime and magnesia, which are the hone and brain making elements of wheat. In the crease near the large eud of the keruel lies the germ, which, though rich in gluten, contains oily and dark matter that injnres the color and quality of the flour and should he removed. Over the germ is a thin scale-like pellicle, easily removed with the thumh nail, revealing the little germ-coutaining cell heneath. The germ, by slight pressure, may he removed, leaving the cell, which, however, is coated with oily matter which shonld also be kept out of the flonr.

At the other end of the kernel is a sort of fine brush appendage formed of numerous downy filaments of a slight salmon tiut. These are useful to the seed in the ground as ahsorhents of moisture, but in the flour impair both its color and flavor, and should also he eliminated. This hrush eud and the crease, with the wriukled surface of the grain, are graud dust and dirt catchers, and a large amonnt of the machinery of onr modern mills is for the sole purpose of cleaning the grain from dirt, and freeing it of the bran, germ, hrnsh and oily matter which iujure its capacity for making white, spongy and uutritious bread.—*American Miller.*

A Frightful Collision.

New York.—The valuahle trotting horse, "Jim Sauds" was ruu iuto in a race, sustaiuing several brnises, and lameuess. His owner Mr. Nohle Thompson, of the well kuowu Boardiug Stables, 1393 Broadway, N. Y., states that he placed the animal under the care of a veterinary surgeon, who in three monts failed to heuefit him. A thorongh treatment with St. Jacobs Oil was theu hegun, and the horse uot only entirely recovered hut was enahled to trot mile heats in the astonishiug time of 2:21. Mr. thompson regards the Oil, as the greatest pain-cure and linament that has come to his uotioe in his experience of fifteen years.

Sudden changes of the weather often cause Pulmonary, Bronchial and Asthmatic trouhles. Brown's Bronchial Troches will allay the irritation which induces coughing. *Sold only in boxes.* Price 25 cents.

Market Report.

FLOUR—We quote: Best City Extra, $5 60@$5 75; Superfine, $5@$5 25; Interior Extra, $4 75@$5 25; Interior Superfine, $3 75@$4 ₱ bbl.

WHEAT—The market in this grain is rather dull of late. The asking price is generally above the ideas of purchasers; $1 80 is the holding price, while $1 77½ is the extreme buying limit. No sale for lower grades.

BARLEY—The market is steadier now than it was in the earlier part of the week. Recent sales are: No. 1 Feed, February, $1 23½@$1 24; do, March, $1 25; buyer the season, $1 29½ ₱ ctl.

OATS—Fair Feed, $1 70@$1 75; Good, $1 75@$1 80; Choice, $1 85@$1 90 ₱ ctl. Eastern, $1 65 ₱ ctl

RYE—Business dull. Quotable at $1 65@$1 76 for fair to good.

FEED—Ground Barley, $27@$29 ₱ ton; Cracked Corn, $37 ₱ ton. Shorts, $18@$20 ₱ ton. Oitcake meal the oilworks sell to the trade at $32 50 ₱ ton, less the usual discount. Middlings, $23@$25 ₱ ton for lots at the mill.

HAY—Alfalfa, $13@$14 50; Wheat, $15@$17; Wild Oat, $14 50@$16 50; Mixed, $11@$13 ₱ ton.

PROVISIONS—Eastern Hams, 19½@21c; California Hams, 16½@16¾c for plain, 16½@17c for sugar-cured canvased; Eastern Breakfast Bacon, 16½@17c; California Smoked Bacon 15@15½c for heavy and medium, and 16½@16¾c for light and extra light; Clear Sides, 15½@16c; Pork, $20@$21 for Extra Prime, $23 50@24 for Prime Mess, $25 50@26 for Mess, $26 50 for clear and $27@27 50 for extra Clear; Pigs' Feet, $16@$18 ₱ bbl; Mess beef, $16 for bbls and $8 50 for hf bbls; Extra Mess Beef, $17 for bbls and $8 75 for half bls; Family Beef, $18@18 50 ₱ bbl; California Smoked Beef, 13½@14c ₱ lb.

FRUIT—We quote: Apples, 30@50c for common and 75c@$1 25 ₱ bx for good; Lemons, $7@$8 per box for Sicily and $5@$6 for Malaga; California Lemons, $2 50@$3 per box; Limes, $7@$9 per box for Mexican; Bananas, $1 50@$3 ₱ bunch; Mexican Oranges $20@$25 ₱ thousand; California, $2 50@$4 50 ₱ box; Pineapples, $8@$9 ₱ doz. New crop Western Cranberries are offering at $15@$17 ₱ bbl.

VEGETABLES—We quote: Marrowfat Squash, $6@$10 ₱ ton; Carrots, 30@35c; Turnips, 75c@$1; Cauliflower, 75c@$1 ₱ dozen; Cabbage, 75c@$1 ₱ ctl; Garlic, 3½c ₱ lb; Celery, 50c ₱ doz; Mushrooms, 10@15c per lb; Okra 75c@1 00; Dried Okra, 15@20c; Dry Peppers, 12½@15c ₱ lb.

POTATOES—River Red, 50@75c; Early Rose, 80c@$1; Garnet Chile, $1@$1 10; Humboldt, $1@$1 15; Tomales and Petaluma, 85c@$1; Peerless $1. Cuffey Cove, $1 10 to $1 20 ₱ ctl.; Sweets, 3c ₱ lb.

ONIONS—Quotable at 50@60c ₱ sack.

BEANS—Bayos $3 75@$4; Butter, $3@$3 25 for small and $3 20@$3 30 for large; Lima, $3 75@$4 00; Pea, $3 00@$3 15; Pink, $2 95@$3 20; Red, $2 95@$3 20; small White, $3@$3 25; large White, $2 75@$3 ₱ ctl.

BUTTER—We quote jobbing lots: Fancy, 28c; choice, 26@27; fair to good, 23@25c; inferior lots from country stores, 17@22c; firkin, 25@26c for good to choice, and 20@23c for ordinary; pickled roll, 22½@24; Eastern, 18@22c ₱ lb.

CHEESE—Fairly steady. California, 14@16c for choice; 11@13 for fair to good; do, factory, in boxes, $15@16; Eastern, 16@17c:

EGGS—California, 35@35c;

POULTRY—Live Turkeys, gobblers, 14@15c; do Hens, 14@15c; do dressed, 14@16c; Roosters, $6@$6 50 for old and $7@$8 50 for young; Hens $7@$8 50; Broilers, $5@$6, according to size; Ducks $9@$11 ₱ dozen; Geese, $2@$2 50 ₱ pair.

GAME—Light demand. Quail, $1 ₱ dozen; Mallard Ducks, $3 50@$4 50; Sprigs, $2@$2 25; Canvasback. $3 50@$4 50; Brandt, $1 25; Gray Geese $2@$3; White Geese, $1 25@$1 50; Honkers, $4@$4 50; Snipe, $2@$2 50 for English and 50@75c for common; Teal, $1; Widgeon, $1@$1 25; Hare, $1 75@$2 25; Rabbits, $1 25@$1 75.

WOOL—No change in prices. We quote fall: San Joaquin and coast, 8@12c; San Joaquin and coast Lamb, good, 11@12c; Northern Fall, free, 15@20c; Northern Fall, defective, 11@15c; Northern fall, Lamb, 15@20c; free Mountain, 11@15c.

HIDES AND SKINS—Dry hides, usual selection, 19c ₱ lb; culls one third less, and Mexican Hides 1c ₱ lb less. Dry Kip, 19c; Dry Calf, 20@22c; Salted Steers, over 55 lbs, 11c ₱ lb; Steers and Cows, medium, 10c; light do, 9c; Salted Kip, 15 to 30 lbs. 11c; Salted Calf, 14@15c ₱ lb; Dairy Calf 70@80c each; Sheep Skins, 25@30c for Shearlings; 30@50c for short, 60@90c for medium, and $1@$1 35 apeice for long wool and wool skins. Butchertown Green Skins bring higher prices.

TALLOW—Quotable at 7½c@8½c ₱ lb for rendered and 11@12c for refined, both in shipping order.

MEATS—Following are rates for whole carcasses from slaughterers to dealers:

BEEF—Prime, 9@10c; medium grade, 7½@8c; inferior, 5½@6½c ₱ lb.

VEAL—Large Calves, 8@9c; small ones, 9@10c ₱ lb.

MUTTON—Wethers are quotable at 6½@6c and Ewes at 5@5½c ₱ lb, according to quality.

LAMB—Quotable at 6½@7c ₱ lb.

PORK—Live Hogs, 6¾@7c for hard and 5¾c@6½ for soft; dressed do 9¼@9½c ₱ lb for hard grain hogs.

REPAIRING NEATLY DONE.

FISH.

Catching a Shark in the Indian Ocean.

In the summer of 1852, heing then twenty-eight years of age, strong, healthy and full of hope, I fonnd myself in company with 183 other adventurous spirits a passenger on hoard of the good ship Revenue, Capt. Seth Crowell of Cape Cod, master, bonnd for Australia. This was, I think, the second ship of the Cameron Line which sailed from New York direct to the antipodes; the Helena heing the first. Though I do not clearly recollect whether the Grey Eagle sailed before or after the Revenue.

Onr passengers were a splendid lot of fellows hailing mostly from Upper Canada, Quebec and Nova Scotia, with some four or five from New York city and Brooklyn. With the exception of two Benedicts, who had their families with them, every man of us was under thirty years of age. Even onr captain, as fine a specimen of an American sailor as ever trod a deck, had not reached his third decade.

We sailed east around the Cape of Good Hope; and when I say that our passage extended to 104 days without a sight of land except the Island of St. Paul, seen at a distance, you may form some idea of the shifts and expedients we were put to in order to pass the time, and of "the fun and diviltry and divarsion" thence arising. We exhausted ever kill-time device known to weary and impatient mariners. Each man had, over and over again, raffled off his superfinous effects, the general and final result heing to leave every one with just about what he had at starting. This mild form of gamhling was the only vice indnlged in, all of the passengers heing of a steady and superior class, and none feeling inclined to risk money in games of chance.

We read every scrap of printed paper to he found so many times over that we are all crammed with literature to the lips. We told stories, played euchre, whist, crihhage, old sledge, and every other game known to Hoyle; got up concerts and glee clubs; pitched qnoits, with rope instead of iron; indulged in private theatricals; shot at floating marks; canght dolphins, porpoises, flying-fish, gulls, albatross, and Mother Carey's chickens; worked np the position and progress of the ship each day, and even carried on a daily paper nntil it died out for want of mental pahnlnm; and then, with the distant gold fields still far beyond onr eager and expectant gaze, we sighed for new delights.

One day we found ourselves hecalmed in the Indian Ocean, south latitude twenty-three degrees, east longitude eighty degrees; within the Tropic of Capricorn, hetween the Island of Madagascar and the Australian coast. For nearly a week a monstrous shark with his two attendant pilot fish had heen following us, much to the annoyance of the old salts, whose superstitious fears pointed to some ill coming.

While the ship one day lay languidly heaving upon the slight swell of the calm hut ever-restless ocean, the old man-eater displayed his huge hnlk close to the port side and there remained, evidently waiting for the nsual contents of the cook's garhage hucket. We had never yet caught a shark, and I asked the captain's permission to take this fellow. It was readily granted, and we proceeded at once to husiness.

Borrowing a shark hook, hent upon ahont two feet of chain, from the mate, we tied a strong line to the chain, put upon the hook a chnnk of pork and threw it overboard. After a moment's inspection, the monster slewed lazily over on his side and took the hait. Two of us had hold of the line, and hy a strong jerk we fastened him securely. Then we got a whale harpoon and drove it well into his shoulder. Next, we took a stout rope, made a running bowline at one end, passed the loop over and around the hook and harpoon lines, pulled the shark's head a little ont of water and jammed the howline firmly ahout him behind the first fin. Then we ran the rope through a hlock at the end of the main yard; fifty willing hands seized it and ran aft, and his sharkship was speedily on hoard.

All this time, to the utter confusion of my preconceived ideas, the fish made no resistance whatever, hnt so soon as he reached the deck there was the mischief to pay. He flopped and jumped and plunged about in a terrific manner, opening and closing his fearful jaws in a vicious and highly suggestive style. There was on board the ship a spaniel dog, which, upon seeing the unnsual commotion, ran up to the prize, harking furiously. He was just in time to receive a violent blow from the tail of the fish which sent him heels over head clean across the deck, where he hrought up howling against the hulwarks. The owner of the dog, a little French Canadian, now seized a handspike and dealt the savage monster several heavy hlows near the tail, and afterwards chopped that powerful memher off. This put a stop to his acrohatic feats, and he lay as quiet as a log.

It was a very large specimen of the great hlne or white shark. He measured a trifle over fourteen feet in length; greatest girth, seven and a half feet; snpposed weight, 1,500 or 1,600 ponnds. Great curiosity was manifested hy all hands as to the contents of his stomach, and upon opening this we fonnd—oh horrors!—the leg of a sailor—'s *overalls*, and not a thing beside!

I got, as my own share, the dressed backhone of the creature, which I long nsed as a walking-stick, and afterwards sold to a squatter in the interior for two pounds sterling. We fonnd the strong, mnsty smell so offensive that we speedily threw the carcass overboard, when it was quite pitiful to see the hereaved pilot fish swimming ahout it in a dazed and wondering state. These looked very much like striped hass, and seemed to he about six or eight pounds in weight. They followed the remains of their deceased patron down into the depths of ocean, and finally disappeared.—*Cor. American Angler.*

Tickling Trout.

A correspondent of the *Angler* says: Reading Beecher's "fish story," I was reminded of an incident related to me by an old friend, of whose truthfulness I never had a douht, a few years since. Within twenty-four hours after the story was told me I wrote it out, using as nearly as possible the relator's language, and sent it to a conntry paper. I enclose a copy of the article:

In riding down town in a horse-car yesterday, I met Col. H. L. R——n, formerly of Delaware county, N. Y. The hright May morning, probably, hrought to our minde recollections of conntry life and its pleasures. Be that as it may, we were soon relating to each other exploits and experiences on snndry hright, beautiful, rippling tront streams in Delaware, Snllivan, Ulster and Greene counties, in which both of us had angled, hefore yon, Messrs. Editors, saw the light of day. Suddenly the Colonel turned to me and asked, "Judge, have you ever tickled trout?" I replied, "Yes, often; and 'hut it can be done proves that even cold-hlooded fishes are not insensible to, and enjoy, petting seemingly as much as [illegible] dogs, cats, and other warm-hlooded animals."

"Years ago," said the Colonel, "Judge Jesse Palmer and I were fishing on Platner's hrook, in old Delaware. The stream was very low, and its waters clear; angle-worms and flies were alike looked upon with suspicion by the wary, cautious tront, and as we approached a pool, despite the utmost cantion, the tront sought shelter and protection nnder the overhanging meadow-turf that lined the stream. Judge Palmer said, 'I'll try tickling.' Laying his rod upon the hank, removing his coat, and rolling up his shirt-sleeve, he gently pnt his right arm into the water, and feeling under the overhanging sod, he exclaimed, 'I feel a trout, and am now gently ruhhing its helly with my fingers, and at the same time I am working my thnmh and forefinger towards its head; as soon as I get them into its gills I shall close on the fish. There! I have him! said the Judge, as he drew from the water and threw npon the bank a pound trout. I followed the Jndge's example in a pool a few yards helow, and soon felt what I supposed to he a large tront. I hegan gently ruhhing its helly, and moving my hand towards its head nntil more than a foot in length had heen manipnlated. I said to the Judge, 'I have a whopper!' Immediately I felt something coiling ahont my hare arm. I closed my hand upon the snpposed fish and drew it from under the hank and water. Imagine my consternation on heholding in my hand and coiled ahont my arm a *horrid, disgusting snake*, five feet in length, and as thick as my wrist. I shook the reptile from me, and to this day shudder when I think of the incident. I have tickled no tront since," added the Colonel, as I left the car with crdled hlood.

Card.

Fish Commissioner Dr. J. H. Taggart, of Ynma, who has really done more for the fish interests of the territory than any other man in it; who has heen honest, efficient and untiring in his efforts to promote this industry—for of late years it has become such—addresses the following to the Ynma *Sentinel*:

OFFICE OF ARIZONA FISH COMMISSIONERS, YUMA, Dec. 22, 1882.—*Editor Sentinel:* Permit me again to trespass on your columns to say that Professor Baird writes me that the recent cold snap has frozen np his carp ponds, and that they may not open till March. This will give all applicants for carp ample time to prepare their ponds and arrange to receive their snpply. The car with carp will pass over the Southern Pacific Railroad, on its way to California, and the fry must he received at some station on that route. It would he hest for applicants in southeast Arizona to arrange with Fish Commissioner Richard Rule to receive and distrihute the snpply for that section. Commissioner Gosper, of Prescott, will do the same, or have it done, for the northern part of the territory, and myself for the sonthwestern part. Territorial papers please copy. J. H. TAGGART,

Business Manager Arizona Fish Commission.

In this connection we will add that those desiring carp ehould not apply for too large a nnmher. When it is known that in 1876 there were hnt four carp in the United States, and from those four millions and millions have been distrihuted, one may form some idea of how rapidly they multiply, with suitable ponds, free from other fish and muddy bottoms, and hut a few are needed to hegin with. The increase is so rapid that in a short time his ponds will he overstocked; so be moderate in your demands.—*Tombstone Epitaph.*

Among the curions phenomena revealed by the sinking of wells in Algeria is the existence of fishes, crahs and freshwater mollnsks at considerable depths in the snhterranean waters. The fishes were covered with sand-mud, bnt the shells of the crahs were qnite hright and glittering—evidence that they had inhabited pnre water.

At the Caledonian hatchery, Rochester, N. Y., a new game fish has heen produced. It is three-quarters hrook tront and one-qnarter salmon trout. It has been christened the hrook salmon tront.

Trout fishing is reported good in the streams in Trinity county and the eastern part of Shasta.

Good salmon trout fishing is reported from Duncan's Mills.

Catfish lately planted in Clond river are flourishing.

Large trout abound in the Truckee river.

We had hoped that the days of chicken shooting matches were past, hnt occasionally we find in an np-conntry paper exchange the annonncement that at a specified place and time there will he turkey and chicken shooting. Turkey shooting with rifles is cruel enough, hnt chicken shooting with shotguns at forty or fifty yards is simply harbarous. The general rule is that as long as the chicken can stand on its legs no shooter can claim it. Usually the oldest and toughest of roosters are selected for this kind of shooting, and very often they are fairly filled with shot before someone happens to he declared winner hy hreaking a leg of the fowl so that he cannot stand np. The writer once saw eighteen charges of shot fired at a chicken that was tied to a stake fifty yards off, hefore it was killed, although more or less at every charge mnst have hit it. Men are hard np for "sport" when they engage in any such crnel pastime, and there should he a special law against it.—*Sacramento Bee.*

The undersigned was not in, or near, any of the great hattles of the late war, hnt can form a pretty good idea of the sonnd of musketry along a skirmish line from last Sunday's experience in crossing the Laguna hridge, near the month of Santa Rosa Creek. A few ducks were flying up and down the Laguna while long lines of "shootists" were strung ont aloug the hanks. Of course it was impossible to count the nnmher of shots fired at one duck, hnt at times it did seem as though all the sportsmen of Santa Rosa, Mark West, and not a few from Mnd Springs, all fired at once and at the same bird. The Laguna is quite wide at this time and the dnck pursued the even tenor of its way, ahout the center of the channel, ont of the reach of gnns. No ducks fell, hnt the shot did! The old mare thought she was in a hail storm and insisted npon getting away from there in a hurry!—*Cor. Petaluma Argus.*

Concerning cows and steers, the form of the feet is an indication of the nature of the place in which the animal has heen reared. In stony regions the hoof grows ronnd and wears away; on the contrary, in soft, moist and marshy districts the hoofs lengthen and flatten out, and the same effect is produced by confinement to the stahle. The round hoof is a very desirable qnality. Continued stall feeding renders the feet so tender that after some years the anihal can take no exercise, nor even comfortably travel over the pasture. The foot grows long and thick, and the creature is entirely unfit for work or for driving to any distance.

BICYCLING.

The Wheel.

See the wheeler with his wheel,
Silent wheel.
How many murderous thoughts pass through our minds as past he steals;
As he glides along the pave
With the silence of the grave,
And the crystalline glittering of nickel-plated steel
Bursts npon th' enraptured sight,
As it flashes dazzling bright,
Till the gamins with delight
(Which the ordinary moral and pedestrian cannot feel),
Yell out: "See the blooming bijit on his altitood'nous wheel,
On his lofty and exalted and velocipedic wheel,
On his wheel, wheel, wheel, wheel, wheel, wheel, wheel,
On his lofty and velocipedic wheel."

Hear the tinkling of his bell,
Little bell,
As it warns the folks to give him room before he rings their knell,
And he dings it all the while,
With a feeble, vacant smile,
As he works his number twelves in a rhythmic kind of style.
And the people, ah! they think,
When they hear that tinkle tink,
"Here comes old Darwin's lost one! here comes the missing link."
And they positively feel
Like smashing up his wheel,
And implanting on his pantoloons some wounds that would not heal,
That would cause him to stand npright as he takes his midday meal,
And wonld give him heaps of tronble as he sat upon his wheel,
On his wheel, wheel, wheel, wheel, wheel, wheel, wheel,
On his nickel-plated, highly-polished wheel.

—*Laarmie Boomerang.*

O why does that young man stand np on his head,
On his head in the mud of the gutter?
Do yon think for a moment that he would fain
Stand there for the purpose of cooling his brain,
Or watching the heavens for symptoms of rain,
In a way so esthetic and nter?

If yon do, yon fail to catch on to his snap,
Fail to catch on his snap, my young friend,
He was going down hill at too rapid a pace,
When, catching a glimpse of a pretty girl's face,
He lifted his cap for a "mash," and through space
He qnick flew and struck on the wrong end.

—*F. W. B. in Bicycle World.*

TRICYCLING VS. BICYCLING.—A prominent English hi and tricyclist has given his experience with the two vehicles at considerable length. Having ridden hicycles for the past six years, tonring all over Scotland and England, made annual records of from 3,000 to 4,000 miles, and won a score of prizes for racing, he says: "I have voluntarily and with malice prepense relinqnished hicycling entirely in favor of tricycling. And this is not hecanse I am getting old, either, for I am still on the sunny side of twenty-five. Tricycles already outnnmher hicycles in the snhnrhs of London, and are seen nearly as often in the country towns. The initial cost of a tricycle is hut a trifle in excess of that of a hicycle; there is no danger in learning, only gentle practice heing requisite to hecome conversant with the pecularities of the machine. The nervous anxiety to preserve the halance and steer on a straight line which makes the path of the hicycling heginner so full of thorns is quite absent on a tricycle; the speed is hut a trifle below that of a hicycle, with the same amount of exertion, and as a whole, the enhanced comfort and safety of the tricycle makes it infinitely to he preferred to the hicycle for all ages of men."

The second ten-mile race hetween John S. Prince, the American professional champion, and Lewis T. Frye, ex-amateur rider, took place Monday, Dec. 18, at the Institute Fair hnilding, Boston, in the presence of ahout 1,000 spectators. The hnilding was better warmed than on the former occasion and was well lighted. The first event was a two-mile race hetween amateurs, which was run in heats. Burnham, Woodside and Carr started, and after varions changes of positions finally finished in the order above named. Burnham's time heing 6:53½. The second heat was also won hy Burnham in 6:54½. Five starters came to the scratch for the one-mile staight away race, which was won hy H. M. Saben of Nnnton. Time, 3:21⅝. The principal event of the evening was then called, hoth men appearing in fine condition. Prince took the lead and kept it for a mile and a half, when Frye supplanted him for two miles. Prince again led nntil the end of the fifth mile when he gave place to Frye. Alternately spnrting and heading until the tenth mile Prince made a final effort, and heat his competitor ont hy about a yard in 32:44⅝, which beats previous American time hy 12⅝ seconds.

Last week witnessed an accession to the ranks of the Benedicts in the person of Herman C. Eggers, ex-captain of the San Francisco Bicycle Club, and racing champion of the Pacific coast. A large number of friends assemhled at Saratoga Hall in response to neat invitations, and after an hour of social conversation, the party entered the parlors connected with the hall and witnessed the ceremony. After congratulations an hour's dancing was followed hy supper, dancing heing again pnrsued and continned unto the small hourswhen the party separated with many wishes for the future happiness of the contracting parties.

The advisahility of taking professional racing nnder the supervision of amateur associations for the purpose of eliminating its abuses has been seriously discussed hy prominent English wheel papers. It is thought that hy mentioning such races at amateur meetings, those who desire to race professionally, hut are deterred hecause of present association will be encouraged to declare themselves. The amateur ranks will thus he relieved of amateurs who are at heart professionals, and professional races will he elevated to an excellence not now known.

A gentleman in St. Louis was recently ordered ont of Forest Park hy the Superintendent, hut refnsed to go without seeing the authority hy which he was to he governed, saying that he would test the law. He was given the opportunity hy the superintendent, who ordered him arrested hy a mounted police officer. The two rode socially to the station, hetween three and four miles distant, where the captain decided there was no authority for the arrest, as the hicycle was as legal a vehicle as a huggy.

Do those who decry hicycling as dangerons ever reflect npon the hrnises, sprains and occasional qroden limhs acquired in the "harmless and safe" exercise of roller-skat g

The dutiable values of hicycles and parts imported into Boston during the past five years amounts to $121,226.

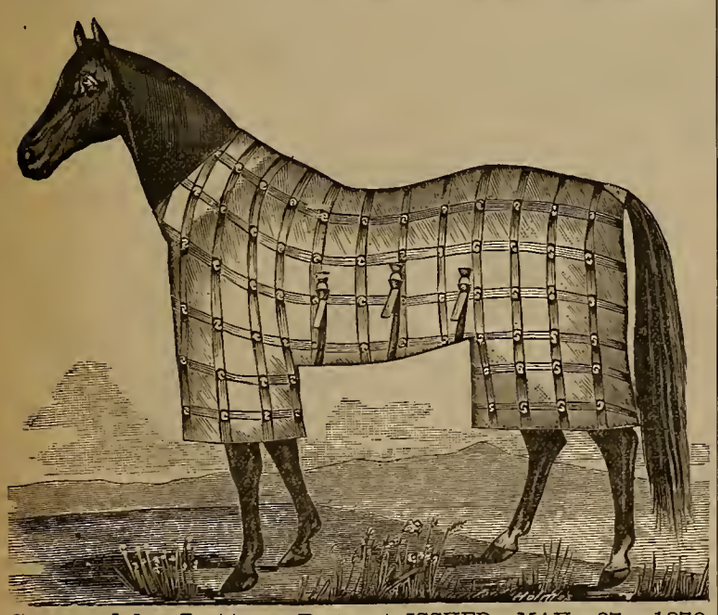
IMPROVED HORSE CLOTHING.



Secured by Letters Patent ISSUED MAY 27, 1879. REISSUED MAR. 29, 1881.

The above cut represents the body-piece, the patent also covering the improvements in the hood. The following are the claims granted:

1. An improved blanket or covering, consisting of the body-piece A, flap C, and the extension B, formed or united together, so as to cover the body and legs of the animal, substantially as herein described.

2. The blanket or covering A, having the flap C, and the extensions B, to fit the fore and hind legs of the animal, front fastenings F G, and the permanent straps or bands E, substantially as and for the purpose herein described.

3. The blanket or covering A, with its extensions B, permanent securing-bands E, and the front fastenings F G, in combination with the elastic neck-extension H, substantially as and for the purpose herein described.

4. The blanket A and hood J, in combination with the elastic connecting-strip I, substantially as described, and for the purpose set forth.

5. The close-fitting hood J, having the elastic band L beneath the jaws, so that they may be allowed to move without disturbing the fit, and adapted to be secured to the cover by means of straps, substantially as herein described.

6. The improvement in covering blankets for animals, consisting of the blanket A, having the flap C, and permanent straps or bands fixed to it to secure it around the body, whereby the use of loose surcingles is avoided, substantially as herein described.

The right to make clothing in the United States will be sold on a royalty. Apply to the patentee,

JOS. CAIRN SIMPSON,

SAN FRANCISCO, CAL.

C. P. R. R.

TIME SCHEDULE.

Monday, November 27th, 1882.

*3:30 P M		
10:40 A M	Salinas, Soledad and Way Stations.	6:02 P M

*Sundays excepted. †Sundays only (sportsmen's train).

Stage connections are made daily with the 10:40 A. M. Train, except Pescadero Stages via San Mateo, which connect with 8:30 A. M. Train.

EXCURSION TICKETS sold on Saturdays and Sunday mornings—good to return Monday—to Santa Clara or San Jose, $2 50; to Monterey or Santa Cruz, $5; also to principal points between San Francisco and San Jose.

TICKET OFFICES.—Passenger Depot, Townsend street, and No. 2 New Montgomery street, Palace Hotel.

A. C. BASSETT, Superintendent. H. R. JUDAH, Asst. Pass. & Tkt. Agt.

☞ S. P. Atlantic Express Train via Los Angeles, Yuma, etc., leaves San Francisco daily via Oakland ferry, foot of Market street, at 9:30 A. M.

TO

Sportsmen & Pleasure-Seekers.

THE

SOUTHERN PACIFIC R. R. CO.

RESPECTFULLY CALLS ATTENTION TO THE

SUPERIOR FACILITIES

AFFORDED BY THEIR LINE FOR REACHING with speed and comfort the best places in the State for

Sea Bathing, Shooting and Fishing.

TRAINS LEAVE SAN FRANCISCO DAILY FOR

MONTEREY,

THE MOST CHARMING

Summer and Winter Resort of the Pacific Coast,

with its beautiful Groves and delightful Drives. Trout in abundance can be obtained from the several streams in the vicinity of Monterey, and the best shooting may be had in season.

THE BAY OF MONTEREY

Is noted for the extent and variety of fish which abound in its waters, notably Salmon, Rock Cod, Barracuda, Pompino, Spanish Mackerel, and Flounder. The above-mentioned attractions, in connection with the low rates of fare, rapid transit, and the superior accommodations furnished at the "HOTEL DEL MONTE," have made Monterey a paradise for sportsmen.

THE BATHING ESTABLISHMENT

OF THE

"HOTEL DEL MONTE,"

IS UNSURPASSED.

A SPACIOUS SWIMMING TANK

(150 x 50 feet)

FOR WARM SALT WATER, PLUNGE AND SWIMMING BATHS.

ELEGANT ROOMS

For Individual Baths with DOUCHE and SHOWER facilities.

MAGNIFICENT BEACH

Of pure white sand for SURF BATHING, Etc., Etc.

THE FAVORITE ROUTE to those well-known Watering Places,

APTOS, SOQUEL AND SANTA CRUZ,

IS VIA THE

Southern Pacific Railroad,

(Broad Gauge), and the

SANTA CRUZ RAILROAD.

☞ At PAJARO, the SANTA CRUZ R. R. connects daily with Trains of the S. P. R. R.

The S. P. R. R. runs through the counties of San Mateo, Santa Clara, San Benito, Santa Cruz and Monterey, in each of which game abounds in great variety. Notably

Quail, Pigeon, Snipe, Duck, Geese, Deer and Bear.

Lakes PILARCITOS and SAN ANDREAS are reached by this line. Stages connect with trains daily at San Mateo for those well-known Retreats, PURISSIMA, SAN GREGORIO and PESCADERO. We would particularly call attention to the unlimited extent of range at and about SAN BRUNO and McMAHON'S for RIFLE PRACTICE.

These resorts are but a short distance from San Francisco and offer special inducements to the lovers of this manly sport.

SPECIAL NOTICE.

Sportsmen and others presenting Passage Tickets of any description issued by this Company will be entitled to

FREE TRANSPORTATION OF THEIR DOGS

when carried in Baggage Cars and put in charge of Train Baggagemen. Train Baggagemen are instructed to issue CHECKS for all dogs received in Baggage Cars.

☞ In order to guard against accidents to Dogs while in transit, it is necessary that they be provided with COLLAR AND CHAIN. Guns and Fishing Tackle checked and carried free of charge. Guns taken apart and securely packed in wood or leather cases may be taken in Passenger Cars.

TICKET OFFICES.—Passenger Depot, Townsend street, and No. 2 New Montgomery street, Palace Hotel.

A. C. BASSETT, Superintendent. H. R. JUDAH, Asst. Pass. and Tkt Agt.

☞ S. P. Atlantic Express Train via Los Angeles Yuma, etc., leaves San Francisco daily via Oakland Ferry, foot of Market Street, at 9:30 A. M.

N. B.—My acknowledged superiority in this branch of business is largely due to careful observation and the valuable suggestions of the most skillful turfmen of the United States, the benefits of which revert to the public in the shape of a GENUINE WELL-FITTING ARTICLE. Sole agent for Dr. A. H. Dixon's Condition Powders and for Makinney's patent "Eureka" and "Eclipse" Toe Weights. Repairing done with neatness and dispatch. Has always on hand the finest assortment of English ladies' and gentlemen's saddles, bridles, whips, spurs, bits and 2¼-lb race saddles.

EQUINE DENTISTRY.

HORSEMEN, ATTENTION.

PROF. H. W. WOODRUFF, LATE FROM BOSton, is located in this city and will make the practice of veterinary dentistry a specialty. He treats no diseases but those of the teeth and mouth. Bit lugging, driving on one rein, balking, bolting, tossing the head while driving, fretting on the bit, drooling and foaming at the mouth, and many other faults are in nine out of ten cases due to bad teeth. Bad teeth not only cause bad habits, but they are the cause of such diseases as paralysis of the stomach, stomach staggers, flatulent and spasmodic colic, fits, indigestion, dyspepsia and other kindred stomach troubles too numerous to mention, through painful and imperfect mastication of food, the sure consequence of disordered teeth. The Professor can be consulted at his office at the Fashiou stables, 221 Ellis street. Office hours from 8 to 9:30 a. m., 1 to 2:30 and 6:30 to 7:30 p. m., Tuesdays excepted, when he will be at Thirteenth street stables in Oakland. Orders left at the Club stables, Taylor street, and the St. George, Bush street, or by mail, will receive prompt attention. Consultation and examination gratis.

N. B.—Particular attention paid to gents' drivers.

IMPROVED Blind Bridle & Winkers FOR RACE HORSES.

Secured by Letters Patent. July 25. 1882.

Having thus described my invention, what I claim as new, and desire to secure by letters patent, is:

1. The part D, supported by the side straps of the bridle, extending back, as shown, the front having an opening into which the blind is fitted, substantially as herein described.

2. In a bridle, in combination with the extensions D, the curved blinds F, secured to said extensions, and as shaped, to give full freedom and ventilation to the eye while circumscribing the vision, substantially as herein described.

3. In a bridle, and in combination with the extensions D, blinds F, and side straps A, the screw, nut and washer E, to secure the blind and allow it to be set, substantially as herein described.

4. In a bridle, and in combination with the checkpieces D and blinds F, as shown, the straps or bands G and H, connecting the branches or extensions above and below the eyes, and having the adjusting slides or buckles, substantially as and for the purpose herein described.

5. In a bridle, and in combination with the blinds F, supported and pivoted to the bridle so as to be movable about the point of support, the adjustable front straps or bands G and H, and the rear band I and the throat-latch or lash connected with the blinds, and adjustable, substantially as herein described.

The above are the claims allowed by the patent office, and though the correspondiug letters do not appear on the cut, the general principle will be understood.

It meets with universal approbation, doing away with all the objections urged against blinds, and at the same time giving complete control of the line of vision. By throwing the lower portion of the blind up something of the same effect on the action follows as is induced by toe-weights. This is especially the case when young colts are the pupils, teaching them to bend the knee without the strain of weights on the feet.

For bridles of all descriptions apply to

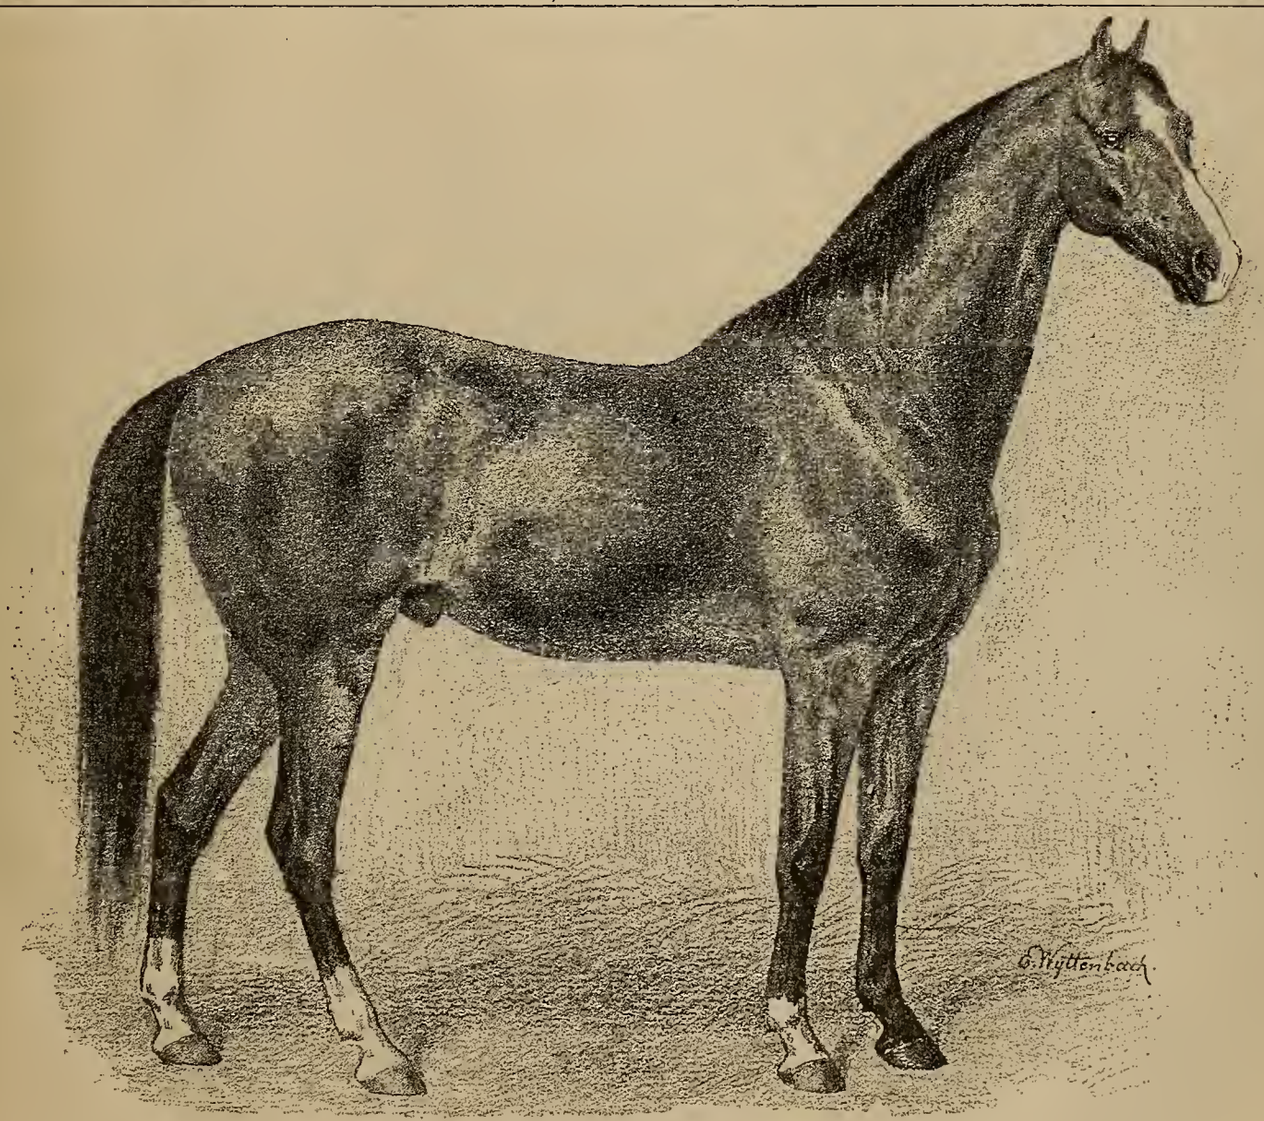
BREEDER AND SPORTSMAN

Vol. II. No. 2.
NO 508 MONTGOMERY STREET. SAN FRANCISCO, SATURDAY, JANUARY 13, 1883. SUBSCRIPTION FIVE DOLLARS A YEAR.



NORFOLK

By Lexington, his dam Novice by Imported Glencoe. Owned by Theodore Winters, Sacramento County, California.

It ie nearly twenty years, the only vacancy heing from January until March, eince we accompanied a friend to Kentucky, the object being to huy a few thoroughhred horses. The time wae when it was eomewhat hazardoue to travel eouth of the Ohio river. The night before we took the train from Covington the Confederates had captured Mount Sterling, and there were all sorts of reports about the numhers and destination of the victorious army. The railway officiale were loth to venture a train, and the start was delayed two or three hours to ohtain definite intelligence. There were well-grounded fears that the track would be destroyed in places and the train attacked, and our companion wae on the point of going home. The little forts at every bridge were garrisoned with Union soldiers, and through the loopholes was seen the gleam of arme. At the coey hotel in Lexington th disquietude was removed, and early in the morning we hired a carriage and driver to visit the places in the neighborhood. Among them was the farm of John M. Clay, but unfortunately the owner was away from home. There was no lack, however, in attendents to show the horses, and eome time was spent in making the examination. There were Lodi and Kentucky, highly bred dams and well-developed youngstere, and reluctantly we left the place, intending to visit it again when Mr. Clay would be at home. We left Iowa with the intention of spending all the time necessary to make a thorongh examination if even it entailed an absence of a fortnight. Another night was pleasantly spent in Lexington, and the morning train carried ue to Spring Station. No notice had been sent, so that we had to walk from the station, and a very enjoyahle walk it wae. The bluegrass soil was green and velvety in the early springtime, a few flowers were in blossom and the air wae just eharp enough to make the exercise agreeable. Mr. Rarey, the celebrated horse trainer, accompanied us, and many were the questions propounded him regarding the horsee of England. He brought back with him the "brilliant savage," Cruiser, and a mare by Van Tromp, called Thetie.

Before lunch some colts near the house were examined, and one of them wae eo exceedingly handsome that he was hought after the briefest exaniination. He was hy imported Knight of St. George from Miriam, by imported Glencoe, and to this day we consider that for beauty and almost perfect symmetry of form we never saw his superior. In paddock, or rather in adjoining paddocks, were two two-ye olts

(Concluded on page 25.)

THE STABLE.

Growth of the Hoof.

The ill effects of rendering nugatory the natural guards against concussion are so palpable that it appears like a waste of space to reiterate the proof of the ill effects that are sure to follow. But whoever will take time enough to become acquainted with the mechanism of the foot, and will give the subject some attention, can scarcely fail to see the importance of retaining the elasticity intact. Not merely that of the frog, as the spring which follows giving the quarters full play is an aid which cannot be dispensed with without serious injury. There is another thing in connection with the topic which is worthy of consideration, and that is the growth of horn. That this is much slower in the foot which has been shod we have abundant proof, and it does not require examinations extending over a long period to become satisfied. Though the horn is deposited by ducts in the coronary band, their activity is stimulated by the natural functions being preserved. In this there is a similarity to the waste and reproduction of the muscles. Muscular effort brings a waste of the tissues, but the action which destroys also stimulates the organs which deposit the material, and the repair is accelerated so that there is an absolute increase of the motive power. Though the loss is greater, there is an extra compensation, a return of the capital with interest. There must be a judicious exercise of the muscles or there will be a diminution in the bulk, and a shrinkage which the blood has not the power to replace. In the foot there may be so much wear that the increased activity of the horn-forming vessels cannot make up the deficiency. Now, as has been demonstrated in previous articles, the foot entirely unprotected (under certain conditions) may wear away so much at the toe as to cause serious lameness. Even this is not so likely to be the case as many imagine, and in many experiments I have found that an unshod foot will stand far more attrition than was supposed to be possible. But to give the foot a fair chance it must be in a sound condition to start with. If it has been rendered weak by a non-use of the parts which nature intended to do a share of the work, it will not stand the test under the most favorable circumstances.

The horse which has worn shoes for any length of time will soon go lame when without their protection. The smith has destroyed the capacity for resistance, and there must be a continuance of the system that has destroyed, or opportunity to recover from the treatment. The growth of the horn has not only been curtailed, but that which is deposited is of an inferior character. It may appear paradoxical to state that as the horn becomes harder it is more rapidly worn away by the attrition of the roads. It will be understood, however, when a comparison is made between the horn from an unshod foot and that which has worn iron for a length of time. The former cuts more easily when the tool used is a sharp knife, but a rasp has less effect. One is an elastic, live material, pliable as a piece of whalebone, the other a brittle substance almost as destitute of toughness as the horn from a dead animal. Mr. Douglas, an English writer, states: "If the crust is closely examined with a microscope, its structure will be found to consist of a number of bristle-like fibers standing on end, but leaning diagonally towards the ground. From the particular longitudinal construction of the fibers, it follows that they will bear a great amount of weight so long as they are kept in a natural state. The crust so viewed resembles a number of small tubes, bound together by a hardened, glue-like substance.

"Whoever has seen a Mitrailleuse gun, with its numerous barrels all soldered together, can form a very good idea of the peculiar structure of the crust (or wall), especially if they were likewise to imagine the tubes filled with a thick fluid, the use of which is to nourish and preserve them." Before microscopic observations revealed the existence of these minute tubes, it was thought that the horn lay in layers like the leaves of a book, and the tubes are so arranged as to form these thin strata. The layers are readily separated, and it does not require a long soaking to make the division. The agglutination is more rigid between the tubes at right angles to the layers, and, consequently, a great force is necessary to rend them asunder. But if the tubes are hardened from dryness, the diameter must be decreased, and there cannot be a full supply of the fluid, the duty of which is to keep the horn in proper condition. The atrophy of the frog in the shod foot is a striking testimony that the nourishment is lacking. There is no longer the stimulus which exercise gives, and though there is no waste from wear, the supply is cut off. The preventing the wear at the toe by the application of a tip, or, more properly speaking, a lunette shoe, extending as far back as the point of the frog, or a trifle further back, does not seem to retard the growth of the horn at the part covered by the iron. This, probably, arises from the posterior portion of the foot being so much more pliant, and the stimulus to the secretory vessels of the coronet sufficient to keep up the healthy action of the whole of the circle. Since using tips I have noticed that the toe would appear long before they had, apparently, been on a sufficient time to account for the extra growth. It was ascribed to the wear away of the heel, while the toe was guarded; but a late experiment shows that this was only partially the cause. On the 19th of January, X X was shod with tips weighing seven ounces each. Previous to that he had been without anything on his feet, and was turned, during the day, into a small lot. There was very little wearing of the horn, and when the tips were put on, the heels had to be lowered to give the proper bearing. When this reduction was made, a gauge was set so as to give an accurate measurement from the ground surface to the junction of the hair and horn. At this date, the 16th of February, four weeks since the tips were put on, the toe is quite long, altogether too much so to give a proper bearing to the foot, but the gauge shows that the wear at the heel has not been quite as much as the growth. He has been used, with few exceptions, daily on the road, and as most of the time the streets were wet, there was more wear than there would have been in dry weather. The streets and drives in Oakland are formed of macadam, with gravel or finely-broken stone on the surface, and the horn wears away more rapidly than in the summer. This experiment was further proof of the necessity for bedding the tip, as heretofore described, into the foot, and also that it is important to frequently reset them. The growth of the horn, between the tip and the foot, being more rapid than when the full shoe is used, the iron must be removed whenever the bearing is thrown out of the proper level. As steel tips, hardened, are used, there is little wear in the metal, and if the heel is not as low as it was, there is the difference to overcome. The best plan is, sink the tip rather more than to bring it to the level of the heel, and the action of some horses is benefited thereby. But as the same nail-holes can be used for two shoeings, when steel is the material, and not longer than three weeks intervene between the "removals," there is no injury from extra perforations. The fewer holes in the horn, the fewer tubes will be cut, and the supply of fluid they carry only slightly interfered with.

"Protection" of the Foot.

The objection to the use of tips which is the most frequently and persistently urged by those who denounce the practice is the claim that the heels will be bruised if left as nature made them. This has a plausible look, and without the person who hears it offered has made some progress in acquiring the art of forming his opinions on what can be proved is very likely to carry conviction. In the former papers on shoeing the fallacy of the claim was shown, but as such wide intervals have elapsed since the publication of the series it becomes necessary to reiterate. With the drawbacks arising from a want of connection, and the necessity of going over the same ground, there are advantages in being able to make more positive statements resulting from later experiments, and if even the repetition may be something like a tale many times told, the subject is of importance enough to warrant the rehearsal. The importance of taking care of the feet of the horse has always been realized, and there have been so many plans for counteracting the ailment which is most prevalent that it appears singular that so little progress is made. The trouble has been that a large majority of those who have been given advice have been themselves misled by the idea that protection to all parts of the foot was indispensable. The few who have advocated the natural method, so far as domestication would permit, have been forced to meet this obstacle, aggravated with the tendency of horse owners to let others think for them, and an unwillingness to give a fair trial to so simple a remedy. When the groom and the smith told the owner that bruises of the sole would surely result if there was not an iron barrier to protect, it appeared reasonable, as it may have been that when a boy he had endured the pain of "stone bruises" from running barefooted, or "stubbed his toe" on a projecting rock. The remembrance of sitting in agony, rubbing the foot in a grip as hard as he could make his fingers clinch it, swaying his body and gritting his teeth as some relief, gave emphasis to the claim, and though he may have gone to the shop, firm in the determination to try the method he had read of, the words had weight and his good intentions were overcome; overcome by dogmatic opinions without argument or legal reasoning to sustain them.

If he remembered as well the acute pain caused by a small pebble or even a kernel of corn getting between the foot and the shoe, he would know that there were other casualties beside bruises to guard against. But there is nothing analogous between the foot of the biped and quadruped, and the stone bruise on the barefooted boy and that which causes corns in the horse are widely different. No matter how thick the skin on the heel may have become, it is a slight protection in comparison to the walls, bars and sole of the horse. That is when all parts of the foot of the horse are in a natural condition. When the smith has pared away the natural defenses so that it will "yield to a strong pressure of the thumb," as is recommended in the essay which drew the $500 prize in England forty or fifty years ago, the only plan is to raise it so that it will not perform the duty it was intended it should. A little more paring and the sole would be entirely cut away, for when it will give to the pressure spoken of there is a very thin layer of horn left.

I have astonished quite a number of visitors by showing them the results of wearing tips in the strengthening of the posterior portion of the foot. The angle between the bars and the walls, the seat of corns, is filled with a dense elastic material which does not show a trace of the discoloration which is nearly universal in shod horses. The frog is as elastic as a piece of solid rubber, and the point of it extends to within a short distance of the toe. A few days ago I was resetting the tips on X X and fortunately a neighbor was watching the operation who adhered firmly to the old, old methods of shoeing. He had frequently urged the necessity of protection, and could not see why the quarters and heels should require it less than the toe. It was a good opportunity to make one convert, and without acquainting him of my intention, I led the conversation to shoeing. He combated the statements energetically, laying the greatest stress on the liability of bruises. He admitted that the chief amount of friction was at the toe, and an old shoe which had the toe entirely worn through at the outer edge, with quite a thickness of iron at the heel, was proof of that fact if he had not admitted it. The blow came on the heel first, and as the foot rolled over the pivotal point, the friction wore away the metal.

"But," he said, "the fact that the blow is mainly on the heel shows the necessity for protecting that with a hard material. In a natural state horses roam over an uncultivated country. There is either growing herbage, fallen leaves, or snow to make a cushion for the foot to strike upon, but on traveled roads, on the paved streets of a city, on the solid body of macadam such as the streets of Oakland, there must be protection." I replied with the query: "Mr. J——, what, in your opinion, would be the effect of driving a horse wearing tips, for years nearly every day, and fast enough to be called a good traveler, on these Oakland streets, and on the roads in the vicinity?" "Bruises on the heel, and the wearing away of the unprotected parts so as to make the animal too sore for use, and if persisted in there would be violent inflammatory action which ultimately would destroy the foot." "Very well," was the answer, "and if you have an hour or two to spare I will endeavor to convince you of the error of your views." This conversation took place in the house and before going to the barn I showed him how the horse had been shod for the past six years by reading extracts from journals. For six years he had worn tips, with a few exceptions. Twice full shoes had been put on in front, and at other times three-quarter shoes, but with the two exceptions the inside quarter had been bare. The three-quarter shoes had been put on for the purpose of testing the effect on the action, and not for any necessity for protection. From Aug. 17, 1880, until Oct. 4, 1881, he was driven without either tips or shoes on his hind feet, and it was rare that there was a day during the time when he was not driven. The tips which he had on were set the 19th of January, and as was stated in the previous article there had been so much growth of the horn that the toes were too long. The gauge showed that there had been a trifle more growth at the heel than the wear. On the 16th of February the tips were pulled off and the extra horn pared away. There was a slight discoloration immediately under the iron, but this was very shallow, and my friend remarked that the hoof was in capital shape, and, doubtless, I had some kind of hoof-ointment which was the means of keeping it in such fine condition. I assured him that the day of all these nostrums had passed away so far as I was concerned.

Soaking-tubs were discarded, and only at rare intervals was a wet sponge applied to the hoof. The place for the reception of the tip was cut, leaving the shoulder which the end of it was to rest against nearly half an inch in depth. It was a work of some time to properly prepare it for the tip, and it is a job which always "starts the sweat" in streams. The trouble is to get a true bearing, and this is far more difficult than when a full shoe is to be put on. In this latter case the eye tells at a glance if it is "out of wind," whereas the shoulders are in the way, and the plan followed is to make the foot surface of the tip as true as I can file it, and then make the horn comport with the tip. Of course the outside of the tip is fitted to the wall before the surface filing is done. When the tip was nailed on the shoulder was an eighth of an inch above the ground surface of the tip when the foot was held between the knees, and this had to be cut away to give the proper bearing. "Now Mr. J——," I remarked, "you will see a foot which has traveled over these Oakland streets for six years, besides galloping with the trotters, trained and running races in harness, worn toe weights, side weights, undergone all kinds of experiments, hacked about to all sorts of vehicles, and with occasional long drives and quite rapid ones. According to your ideas the foot should be ruined beyond hope of redemption. You acknowledge that the outward form is nearly perfect; it would be entirely so if he had never worn shoes; and now we will look for the bruises which a short time ago you said were sure to be found." It cut readily and the knife sliced off a piece from the shoulder to the heel and about a sixteenth of an inch thick. It was from the inside quarter, and beneath it the horn did not show a particle of discoloration as had been the case at the toe. We handed it to him, and he bent and twisted it, put it between his teeth to test the toughness, noted the width of the frog and the india-rubber-like elasticity it displayed. After a minute and careful examination he admitted that his previous opinions were certainly erroneous, but before he made many remarks I interrupted him, with a request that he should pay me another visit in a week from that time when a new set of tips were to be put on Anteeo, as I desired to show him a perfect foot. That of X X had been injured by wearing shoes, and came very near breaking down on that account, while the colt has never worn shoes in front.

Rattlesnake vs. Blacksnake.

On the other side of the Santa Fe water tanks, on one side of those gravel hills, at 3 o'clock yesterday afternoon, says the *Fort Worth Democrat*, a fight occurred between a rattlesnake and a blacksnake. The rattlesnake was apparently on a journey, and the meeting was quite accidental. At first the rattlesnake sought to avoid a difficulty, but when the blacksnake pressed the matter, he halted and folded his length into the coil. The blacksnake glided around in swift circles; the rattlesnake never changed his position. But the circle still diminished its size, and as the blacksnake drew close the rattlesnake appeared to grow confused. His rattles ceased to give out the sharp sound, and his head drooped as if vertigo was seizing him. The blacksnake seized, by a lightning movement, the rattler by the throat, and, winding him up in folds, the two rolled over and over together, and in a few moments the rattlesnake ceased to breathe. An examination of the dead body of the rattlesnake revealed a fracture in the spine as complete as if done by a blow with a club. This rattlesnake measured, dead, five feet and three inches.

TWO MEALS A DAY.

An Eastern Physician Who Favors the Two-Meal System for Horses.

A writer in the *Mirror and Farmer* speaks of having fed his cattle on the two-meal system for the past seven years, and finds no occasion for feeding oftener; in fact, he says they thrive better than on the "cramming system," or more frequent feeding.

Although I have never doubted but this system would work as favorably with horned cattle, my own experience has been confined mostly to human beings and horses. According to my judgment, this system, applied to work or road horses, will increase their working capacity very largely; i. e., any given horse will do more work, day after day, either in the cart, before the plow or on the road, and keep in prime condition; besides it would surely and because of his improved health tend to prolong his life—extend his years of usefulness. But aside from mere theorizing or dogmatically asserting my opinion, which, however, I find is corroborated by every one who has given this system a fair trial, I would give here a few illustrations as to its operation on road horses. First, my own experience: I bought a little, "chunky" mare, six years old, fat and lazy, fit for nothing but a timid woman's use—just right, one would say, for the women and children to jog round town with. She would travel about four and a half to five miles an hour with considerable urging, and if pressed beyond that would sweat profusely. Having been recently imported from Canada, it was predicted by all the horsemen about that she would have "the distemper" as a matter of course. In order to the more effectually guard against this, I fed her but once a day for a couple of weeks, giving her from ten to twenty miles jogging every day, Sundays included, thus reducing the fat and increasing the flesh! Her one meal consisted of a very generous feed of hay, and six quarts of oats at night, after being thoroughly rested from work. After this and with a considerable increase of work (averaging, all told, 150 miles per week), I gave her a light feed of hay and four quarts of oats in the morning; several times during the week I would give a few roots in place of a portion of the dry grain. In the course of three months her weight, which had at first fallen off quite rapidly, was but slightly less than when I took her, but it was made of a different substance altogether: I had exchanged 100 pounds of fat for 50 pounds of flesh; or, in other words, I had relieved her of that much disease (effectually preventing the predicted outbreak), and had built up in its place a large amount of muscle, at the same time improving the quality of her entire muscular system.

Speaking in a general way, a horse is an engine made up of innumerable muscles which increase in size and quality by increased use (always supposing a sufficient diet), and diminish in size and consequently in power as the work is less or lighter. Consequently, if the horse is fed for health, i. e., in proportion to his labor, his weight will diminish with lessened and increase with added work. In feeding in the morning I aimed to allow some two hours or more—the more the better—for stomach digestion before harnessing, and the evening meal was never given until long enough after she came to the stable to insure her being well rested from her labor, and this, though her dinner was postponed till *n'importe* what hour at night. Whenever I had occasion, and I sometimes took occasion, to give her some early work, her breakfast would be postponed until long after the drive was finished, or at any convenient hour when rested and not obliged to resume work soon thereafter. I would say further, that if it should be necessary to make an all-day journey, starting at a very early hour, a horse fed on this system (and including any other) had far better do the day's work before eating at all (resting at noon, of course, and watering judiciously whenever thirsty) than to eat immediately before or soon after hard work. Providing always the horse be liberally, that is sufficiently, fed, the time of feeding is of small account compared with the vital necessity of obeying this natural law in order to prevent indigestion. With strict obedience to this law—and the two-meal system renders this an easy matter—if the horse is never overfed nor kept in a stived-up stable, he will not get foundered, have "pinkeye" (influenza) nor catch cold, though every stable in town may be decimated with an epidemic. The same horse will do more work, stand more exposure and keep in prime working order, fed upon this principle than under the ordinary method, which is that he must have his feed at or near the regular hour, than oxen with three meals every day. Within four months this little fat, soft, leggy mare was transformed into a clean bodied, tough, hard little roadster that would take two in a buggy eight miles an hour for three or four hours, and after an hour's rest take them back again in the same time, and do it, too, without whipping or showing any symptom of lagging. When I sold her I told the buyer how I fed her. Did he learn anything? No, indeed. "Well," said he, "I shall give her all she wants three times a day, as long as I own her." I see her now every day; she is just about where she was when I took her, fat and soft, and will sweat profusely if driven fifteen miles in three hours.

I next took a "pulling" mare, just up from pasture where she had been all summer. She was, of course, very round—filled out full with fat and water. I obtained possession of this mare expressly to test the effect of the "rational system" on a "puller," a horse of whom it was said, "She hasn't any judgment," "she wants to get there too soon," etc.; she was no comfort to anybody, no woman could drive her, and few men cared to ride after her. I put her at once on the two-meal plan and gave her ten to twenty miles sharp drive daily. In a week my wife, who is by no means anything of a horsewoman, was driving Mollie everywhere in perfect safety. In a few months this mare, like her predecessor, was transformed completely, from a fat to a muscular animal. In her case the indigestion, caused by over frequent feeding, which made the other and which makes so many others, indeed, "lazy," had the effect to keep her so irritated and nervous that she was headstrong and not readily managed. We see these two phases of disease all about us, in the case of human animals. I am amazed to see how few people, even "horse" men, know the difference between two animals, one in "condition," that is, muscular, plump and round because of the muscles having been built up by use, and one that is simply fat. The fact is, the fat horse (or the fat man, or any other fat creature) has not a sound tissue or organ in his body; what muscle he has is "mixed" with fatty matters; that is the muscular tissue itself has here and there given place to globules of fat, or in other words, the creature is to a greater or less degree suffering from fatty degeneration. If any one wants to comprehend this point let him examine carefully and compare a slice of sirloin from a fat, stall-fed ox, and one from the loin of a "working" ox, slaughtered before fattening; and every farmer knows that in life, the latter "can pull the stall-fed ox and his load," it is quite customary to keep up the feed of trotting horses, between seasons, permitting them to become somewhat fat; and then when they are to be fitted for sharp work, this fat is worked off and out, while the muscle is being worked on and improved in quality, by getting rid of the fat which has all along been eating into the muscular fiber, so to say; or in other words, the horse is allowed to take on disease by feeding him in excess of his work, and then is "cured" by restoring the just balance between work and feed. This is, in my judgement, very bad policy—proving in the end exhaustive of vital force—ruins a great many valuable horses, and injures all that are thus treated. The long rest, or at least ample rest, is no doubt beneficial to horses who are at times put to great strain, but the aim should be to maintain the balance—they should be fed physiologically: "Little work, little feed" should be the rule; unless, indeed, the horseman feels the necessity—since he is dependent, usually (if a dealer), upon the fat, sleek appearance of his horses—of keeping up the appearance of his animals, whether they get much exercise or not. But this does not demand three meals, by any means, since the horse will eat at two more than he can digest and assimilate, and may be kept fat on this system, and with less danger of any ontbreak of disease than if he is more frequently fed. The last named mare Mollie, I sold, and she was, unfortunately, returned to her old way of feeding. The first month, on three meals she lost 30 lbs., although, or rather because she had less than half the work she had been doing; after this she began to increase in weight, until her original weight was reached; but she had exchanged muscle for fat, and although she did not afterwards "pull" she never has since, nor had she ever before, the condition—the muscular power, the ability to do a long hard day's work with little effort, as during the year I owned her.

In one other instance a transient season of this plan, a few weeks only, under my administration, began a favorable change in an old and valuable horse that was looking a little "seedy:" In this case simply leaving out the noon feed, giving the regular breakfast and supper, of the same amount each, as had been given all along, set the horse gaining in weight and appearance. She had become dyspeptic from overfeeding. I have never known an instance where the system, pursued year after year, resulted in failure. I could name a score or more cases as marked as those here given; while in many more the only apparent effect upon good horses that were already in good health and condition has been to keep them thus with something less of feed; but the gain in feed and saving of time is trifling compared with the saving of horseflesh, for animals that are habitually fed at noon (even if the "two meals" are divided into three) will sooner or later get severely hurt by reason of the heat and fatigue of the forenoon, and the resumption of work again in the afternoon, since this prevents the digestion of the mid-day meal. Without doubt most hard-working animals digest a considerable proportion of all three of their meals at night after getting thoroughly rested from the day's work; the balance (quite a perceutage, too, with highly fed animals) does not simply pass along and out as an undigested residne always, but ferments (as indicated often by flatulency or some degree of purging, etc., or, again, constipation may be produced), poisons the blood, overtaxes the kidneys and the lungs, until finally, whatever the weather, and with or without unusual exposure, breaks ont in what is popularly, but mistakenly, called "a cold" (slight influenza), and if the conditions have been especially aggravated, as, for example, if the stomach has been very much overloaded frequently, or if during a period of reasonably warm weather there has been no diminution of feed, etc., the result may be a full-fledged infinenza. In fact, the various phases of this disorder, I may say, indeed, a very large range of "diseases," are the product of (1) errors in diet—as to (a) time, (b) frequency, (c) and amount—causing indigestion, and, consequently and unavoidably, a greater or less degree of actual blood-poisoning, and (2) lack of fresh air in the stable. This principle holds with regard to owners, as well as to the horses themselves, but speaking only of the latter, these errors corrected absolutely, and in 1,000 cases there will be no "colds" or other internal disorders year in and year out. It would naturally follow that thorough ventilation (guarding against direct drafts), a temporary and absolute fast, followed by an abstemious diet until convalescence is thoroughly established, would be the natural cure for influenza; but so in practice I have found it in every instance, in the case of animals of whatever kind, including man. This treatment is successful where all others are unsatisfactory and often fatal, and in every instance will afford an immense saving in time and vitality, saving life where cure is possible. The facts prove that influenza, or any form of so-called "cold," is a fever, pure and simple; however chilly the patient may feel, the thermometer placed under the tongue, or in the rectum, shows at once that the temperature is above the normal point; and in all cases of feverishness there is disturbance of the alimentary organs, whether evident or not to the casual observer; and rest from all digestive labor is the proper "tonic." It is a great piece of folly to encourage eating in the absence of appetite; it is only less foolish to eat even with an appetite, when evidences of this disorder have appeared. Taken at the ansit, a single day of fasting, with regular work or exercise, will usually nip the disease in the bud, though sometimes and whenever there has been a delay in treatment, a somewhat larger "dose" of this remedy will be required. When the disease has been permitted to run until the blood-poison has affected the entire organism to the point of weakness, the muscular system should not be taxed unduly, but some degree of exercise (hand-rubbing, if the creature is too weak to move about), and in the open air, is desirable. Fresh air, light and plenty of pure water are always in order.—*C. E. Page, M. D., in Turf, Field and Farm.*

Concerning the Morrils.

Hopeful, in the December number of *Wallace's Monthly* says: "Go to Woodstock, Vt., and they will tell you they have been Morrilled to death, and the whole State has been Morganed to death. You want an outcross and you have it under your very nose, and when too late you will see it." One can judge that Hopeful is interested in some other stock of horses that are not Morgans or Morrills. As we are somewhat acquainted with the Morrill family and the Morrills of Woodstock, we will give some of the most interesting facts in regard to them. The first Morrill horse that the breeders of Woodstock had the privilege of using was bred by James Morse, of Hartford, Vt., and was foaled in 1854. His sire was Young Morrill. He was a large, fine-looking bay horse, standing 15¾ hands and weighing 1,100 lbs. He showed great speed at times, but his gait was a little mixed. Toe-weights would have made him one of the fast ones. He was sold and taken to Virginia the fall of 1860. He left excellent stock and was the sire of Queeche Maid, record 2:25. Breeders now see that they should have kept the horse at Woodstock; that they missed it in not being Morrilled more with his stock.

Draco made his first season in Vermont in 1857, at Royalton. His good size, great speed (he was but six that year and got a record of 2:35), easy way of going attracted much attention, and he was quite liberally patronized. He made the seasons of 1863 and 1864 at Royalton. Draco did not prove a prepotent sire of trotters. His colts made great roadsters and fine free drivers, but they did not have the speed of their sire. They sold quick at large prices. There are but few of them left. One of his sons, called Young Draco, was kept several seasons at Woodstock. He was a very fine, stylish looking bay, had a genteel way of going and could trot close to 2:40.

Gen. Grant, as the Saul Horse, made several seasons at Woodstock from 1864 to 1867. He was owned by James Saul of Strafford, and was by Young Morrill. He was a large, well-made, fine-looking bay, nothing coarse about him, 15¾ hands high, and weighed 1,100 pounds. He was a very fast walker, but had a mixed gait. His stock proved good. Many of his colts were fast and sold for large prices. None who owned them thought they had been Morrilled too much. It was in 1863 that certain parties did not want the owner of Draco to have the fastest horse in the State, and they were on the lookout for a horse that would beat him. It can be seen by this that the feeling of wanting to have the fastest horse is not confined entirely to high life. It was in the fall of 1862 that John Morrill, afterwards called Woodstock, showed quite fast. He was five years old at this time, and showed a trial mile in 2:44, though he done some running to make it. He won a very good race on the ice the winter before. The fall of 1863 he showed a half-mile private trial in 1:17½, and in a race with Draco that fall he was close to him in the heats, the best one being trotted in 2:39. The driver of Draco had agreed before the race to pull the horse to make it look like a close race. Many thought then that John Morrill would make a faster horse than Draco, and a gentleman of means bought him the in spring of 1864, giving $4,400 for him. He was then renamed Woodstock, and kept at Hartford that season. He showed a private mile that year in 2:35, but his show in public was poor. Part of the season of 1863 he stood at Woodstock. He was trained the season of 1865, and got a record of 2:40. At the Windsor Co. Fair that year he trotted a public trial on a half-mile track in the presence of six thousand spectators in 2:33. The first half was trotted in 1:14. He would have trotted close to 2:30 had it not been for a bad break in the last half. The season of 1866 Woodstock was trained, but trotted no races. The seasons of 1867 and 1868 he was kept in the stud at $50 to insure. His reputation stood high at this time, but on account of the high price of service he was not very liberally patronized. The season of 1868 he showed at the State Fair at Burlington, and competed with Daniel Lambert for the premium as the best stock horse. Daniel was given the first premium and Woodstock the second. Woodstock made the season of 1869 at Stowe, Vt., and while there a bone spavin was developed. That year several of his colts showed quite fast, and he was returned to Woodstock in the fall. The high service fee prevented liberal patronage, although his reputation as a sire was increasing. It was the season of 1871 that his son, Royal John, made a record of 2:26¼. The spring of 1873 Woodstock changed owners, but was not removed. His service fee was reduced to $25 to insure, and for several seasons he was well patronized. The season of 1873 he was shown at the State Fair, and was awarded first premium as the best stock horse. Woodstock died in 1877, shortly after covering a mare.

Why so much has been said in regard to Woodstock, Vt., is this: If Woodstock has been Morrilled to death, it has been by the stock of this horse and his sons. It cannot be claimed he was an extra stock horse, yet he is a standard horse by his own record and the record of his get, which is better than can be said of some Hambletonian horses. His stock had good size and color, and some were free, good drivers. His reputation stood so high at one time that many of his sons were kept entire, as is often the case. Hermit, record 2:40, has proved his best son in transmitting speed. Robert Bonner, record 2:40, left good stock, and so did Killindon, record 2:42. Woodstock Prince's stock is showing well. He trotted close to 2:40.

Mr. Campbell of Barnard owns a very promising five-year-old son of Woodstock that trotted close to 2:40 the past season, and his owner refused $600 for him. It will be admitted by everyone that Woodstock was a noble looking horse, a coal black, nearly 15¾ hands, and weighing at times over 1,100 pounds. His neck was arched, a trifle short and thick, but he carried it well. His fore and hind parts were remarkably good, and his colts generally had his good back. He was built more for strength than for speed, yet his hind parts were indicative of speed. He had a fine tail, full, with long hair. His mane was rather light and short. He was cross and had a mean, treacherous disposition. His way of going was heavy and tiresome, either slow or fast. He could show great speed for a half mile, but his way of going at speed was so hard and tiresome that he could not keep it up long without breaking. When he trotted fast he trotted angry, and when he broke he broke to run. It was hard to manage him at times. He took his color, form and disposition from the side of his dam.

This section of the State has had plenty of chances for out-crosses, and these chances have been improved more or less. Ballard's Cassius M. Clay made the most of his seasons at Hartford. He left excellent stock, with four of his get in 2:30 list. Several of his sons are kept in the stud. The best of his get, Cassius Prince, record 2:29, was when here one of the fastest and best moving horses ever raised in these parts. He had a very fine, genteel way of going. His stock take after him in these respects. Susan P, a daughter of his, trotted her first season in 2:41¼, and could have trotted in 2:35. Her dam was by Woodstock Prince.

Kent, by Rysdyk's Hambletonian, dam Lady Griswold, by Adams' Flying Morgan, made the season of 1875 and 1876 at Hartford. His stock proved so good although the horse had been sold and taken to Wyoming Territory that a stock company was formed here and the horse purchased back at large figures. When he was taken from the car after his long ride he showed as much life, spirit, and courage as did his great-great-grandsire, Messenger, when he was taken from the vessel that brought him to this country.

A very fine Lambert stallion is owned here. His dam is by Ballard's Clay. Mr. Morgan, of Woodstock, owns a Woodburn Pilot stallion that is getting very good stock, and Mr. Billings, of Woodstock, owns a very promising Messenger Duroc stallion, dam by Harry Clay. It was in 1870 that the breeders of this section had the first opportunity to breed from one of Rysdyk Hambletonian's sons. That year Hambletonian Monarch was taken to Randolph. His good size, color, and being by a sire of trotters caused him to be largely patronized at first, but he proved a failure in regard to siring trotters. His fastest one, Nancy, was out of a mare by Woodstock. Monarch is no trotter and has a very poor way of going. Mr. Helm speaks of the failure of the Star-Hambletonians in transmitting speed. Aberdeen has proved the best. If Walkill Chief had lived he might have been as good or better.

Now one word in regard to the Morgans. If the breeders would aim to have the horses they breed have some of the good qualities of the Morgans, it would do well. As for me, give me the pretty Morgan horse to drive, with his [illegible] spirit and action, his quick, nervous, easy way of going.

will run up and down the long hills without tripping or stumbling. Give me such a horse for a pleasure drive, rather than one of the homely, big-headed, ewkward, stumbling fellows thet are so often the result of some of the outcrosses. A body has to work his passage in driving such horses. You have to keep hold of them all the time to keep them from falling down and breaking their necks or their drivers'. One has no such trouble in driving a Morgan house. —*Hartford, (Vt.) Cor. New York Sportsman.*

TURF AND TRACK.

Nominations in Occident Stake.

The Occident is a stake of $100 each, $25 to be paid when the stake closed, $25 the 1 st of January, 1884, and $50 thirty days before the time fixed for trotting. The smallness, comparatively, increases the list of nominations, so that there are thirty respondents, and, in all probability, the amount will be about the same as in the Stanford. The nnmber of entries insures a good field of starters, and there is scarcely a question that among the lot there will he several flyers. The high-breeding of the youngsters as nearly insnres this as anything in the future can be foretold, and it is e safe assertion that in the whole of the United States it wonld be difficnlt to select thirty colts of more fashionable hreeding. While the preponderating blood is that of Rysdyk's Hambletonian, the Clays are represented hy Sultan, the Bashaws by Buccaneer, thougb as both of these families sprung from the imported barb, Grand Bashaw, there is only a slight difference in the lines of blood. Andrew Jackson was the sire of Henry Clay and Long Island Black Hawk. From the former came Cassius M. Clay and his noted son, George M. Patchen, and numerous others of distinction. Long Island Black Hawk was the sire of Mohawk, the sire of Elmo, and the great-grandsire of Buccaneer. General Benton is from another branch of the Abdallahs, comhining that blood with strains of Blucher and Bishop's Hambletonian. Poscora Hayward is from the Patchen side of the Clays, and A. W. Richmond a representative of the Blackbirds. The sires represented by their progeny in the Occident stakes are: Sons of Rysdyk's Hambletonian, Electioneer and Arthurton; grandsons Stienway, Santa Claus and Brigadier; great-grandsons Nutwood and Whipple's Hambletonian. Thns there are seven descendants of the great progenitor of trotters the blood of which is on tbe Pacific Coast, and only two of these are not still located here. The absentees are Nutwood and Santa Clans.

A National Jockey Club.

The proposition to organize a National Racing Association, to be composed of the jockey clubs of the Union, has been revived in New York, and friends of the movement are endeavoring to bring it iuto tangible shape. Appropos to this revival the New York *World* says:

Tbis is a subject which not only the *World*, but nearly all the papers making "the turf" a feature have from time to time agitated, tbe *World* going so far two years ago as to euggest tbat a meeting of owners, breeders aud officers of racing associations should be held in Baltimore on the day preceding the regular autumn meeting, under a call of the Maryland Jockey Club. This suggestion the officers of that club supported at first, but afterwards failed to act in the matter. In fact, the apethy of Eastern associations on the eubject has beeu tbe principal cause of the non-organization of a National Jockey Club years ago. But witb the great increase in the number of race meetings in this country, taken in connection witb Colonel Clark's arguments in the matter, it now looks as if a meeting to arrange for a general convention would ahortly be held in tbis city or at some other central point convenient for all iuterested.

With the preliminaries arranged for such a meeting the racing public would at once hecome interested in the legislation necessary for the better protectiou of the turf, and realize that anything suggestive of fraud can be reacbed by the adoption of a set of rules wbich, like the Constitution of the United States, shall be law for all, and which shall protect alike breeders, owners, associations, the general public and all employees connected with racing, the poor and ignorant as well as the rich. The association should adopt such laws governing betting that will serve both the layer and taker of the odds, for if tbe subject of betting is ignored one of the principal reasons wby there should be a National Jockey Club would be overlooked. The subject of weigbts to be carried should also be discussed, and if no rules on the subject were actually edopted, a tacit egreement could be mede that on and after a certain date there should be a general increase, with e sliding scale for each month, that wonld he satisfactory alike in the East, West and South. Another important feature wonld be the appointment of a board of stewards to consider appeals from the decisions of the judges or stewards of associations. To such a board questions such as the Ada Ban decision, as to whether she carried the proper weight for the Ladies' Stakes at Memphis, the claim of the owner of Eole to start for the Pimlico Stakes at Baltimore without carrying certain penalties, and the case of the jockey Quantrell for reinstatement could all be referred. The case of Quantrell specially shows the necessity of such a board. He was "ruled off" at Saratoga last August, and, as he avers, unjnstly. Recent efforts to secure reinstatement have failed becense Captain James Franklin, one of the judges refuses to give his consent, saying: "I do not see that any good will arise by reinstating a party ruled off for fraud." This is a very hard decision if Quantrell can prove his innocence. It has been suggested in some quarters that if a National Jockey Club is organized it should take cognizance of dates claimed and in a measnre prevent a conflict of interests. Such legislation would be unnecessary and practically impossible in a country of so vast an area as the United States. There are, however, several features of importance other than those named, such as the right to claim and register colors, to run horses in assumed names, to name and change the names of horses during the progress of a meeting, and, above all, the adoption of some rules looking to the apprenticeship, instruction and general protection of the large number of minors that it is necessary to employ in the interest of racing. The consideration of the above questions, if referred to the following gentlemen suggested by the *Turf*, would be not only a labor of love, but one of duty which they would gladly embrace. Mr. August Belmont, Messrs. George L. and Pierre Lorillard, Mr. D. D. Withers and James Galway, of New York; Commodore Kittson and Mr. A. J. Cassatt, of Pennsylvania; Governor Bowie and Mr. Frank Hall, of Maryland; Colonel J. C. McKibbin, of the District of Columbia; Major T. W. Doswell, of Virginia; General Harding, Captain James Franklin and Colonel Geo. W. Darden, of Tennessee; Colonel M. Lewis Clark, General J. F. Robinson, Mr. James A. Grinstead and Mr. Daniel Swigert, of Kentucky, and Mr. William Cottrill, of Alabama, to say nothing of many others identified with the Chicago, Cincinnati, St. Louis, Memphis, New Orleana and the Pacific coast associations.

Racing at Red Bluff.

After a hiatus of fifteen years, turf sports have been revived in Tehama County. J. E. Endicott of Red Bluff has constructed a good track within easy distance of that thrivinglittle city and a day's sport was enjoyed by a large crowd on New Year's day. The principal event was a trot for a purse of $65, contested for by local aspirants for fame. The following is a

SUMMARY.

Red Bluff, Cal., Jan. 1st, 1883.—Trotting heats of a mile. Purse, $65; $40 to first, $20 to second, $5 to third.

J. E. Endicott names h f Bay Prince	1	1
W. B. Roberts names s h Selim	2	2
Al. Leach names s h Capt. Jack	3	3

L. Douglas names h m Lilly	2

Time—0:50.

Same Day—Third race, trotting, dash of a mile.

C. B. Ashwist names hr h Peacock	1
P. D. Logan names s h Ephraim	2
———Cromwell names d m	3

No time reported.

Some minor events followed:

The fourth was a running race, single dash, 400 yards, for a purse of $20; Rowley's bay horse won the race and money in 0:16, heating Sweeney's black mare.

The fifth was a running race, 400 yards, for a $20 purse. John Coffee's Roh Roy won the race and money, beating Charley Tait's chestnnt.

The sixth and last was a trotting race between Peecock and Ephraim for a purse of $20, single dash of a mile.

There will he further racing at the track on Feb. 22d.

Name Claimed.

Suisun, Cal., Jan. 6, 1883.

To the Editor of the Breeder and Sportsman, *Dear Sir:* I claim the name of Ethel H for my filly foaled April 28, 1882, by Sultan, her dam Juno by Pat Malloy (by Geo. M. Patchen), grand dam Boston Maid hy Ethan Allen.

P. S.—What is the address of Martin Rollins, the trainer of horses? C. F. D. Hastings.

The address of M. Rollins is Santa Rosa.

Short Horses in Oregon.—The match race for $100 a side, between Simpson's Capt. Jinks Jr. and Dollarhide's Dick, which was run near Ashland last Saturday, was won by the former. The distance was 440 yards. The Dollarhide party were unsatisfied and another match was mede on the same terms, to he run on the 20th inst. Cotton Nose and Blue Mountain Belle are matched to run six hundred yards at Oak Grove on the 10th of January for $1,000. Last Monday articles were signed for a race between Sagebrush Sammy and Red Jacket, one half-mile, for 1,000, to be run on the 5th of next May over the Prineville conrse. Cotton Nose and Belle are said to he two of the best animals in the state, and the race will attract the attention of sporting men everywhere. Sammy and Red Jacket are both good horses, and their race will be liitle behind that of the others.

Mr. William Day, in a communication to the London *Sportsman*, dated Cholderton Lodge, Salisbury, denies the statement made by John Hannigan, the American trainer, that Foxhall's feet are badly contracted and appear to have been sadly neglected. Mr. Day says: "I have only to contradict this reckless assertion and misleading acconnt of Foxhall. Here hy implication he directly charges me with neglecting his feet, whicb I wish publicly to deny aud to say in proof of my statement that au emiuent veterinary surgeon but lately examined him and pronounced his feet good and free from disease; and from no cause, I may say, has he ever heen lame witb them."

The race which was to have taken place on New Year's day at the Woodland track, and which was postponed on account of the weather, bas been declared off. Chris Lurch has shown excellent management of the track thus far, aud it will no douht become a popular resort for the lovers of sport under his supervision.

THE 2:20 LIST.

The Pride of Place Accorded to Horses of Hambletonian Blood.

In point of nnmbers and the greatest speed, the Hambletonian family comprise uearly 50 per cent of the 2:20 list. There are ninety-seven members, forty-three of which are Hambletonians. This list may be regarded as an essay, eloqnent in all its bearings upon the much-discussed problem of how to breed the trotter. It does not tell all the tale, but demonstrates the fact that the greatest excellence comes from excellence—at least in the genns equine; that the horses which have reached the extreme limits of trotting speed were those in which the the trotting element predominated. The dominant blood controls the formation and instinct. This is an inexorable law of natnre. The chief aim in breeding the trotter is to get an animal which will be very fast, and at the same time stont and lasting. Both these attribntes depend upon proper selection. A sire that is fast himself, or comes of a family noted for speed, bred to a mare having the same characteristics, is apt to get a fast and lasting one. The 2:20 list as now stands proves the truth of this assertion. There are some horses in it which have made good records, with no great trotting strength in their pedigrees, but with one or two exceptions they have not equaled their records or made great canpaigners. The two leaders of the list are dyed-in-the-wool trotters, and have both gone on and improved. Mand S, by Harold, dam Miss Russell, by Pilot Jr., has a record of 2:10¼. She is stout, lasting and pnre-gaited. Harold was got by Rysdyk's Hambletonian, dam Enchantress, by Abdallah; grandam by imported Bellfounder. Miss Russell is out of Sally Russell, by Boston, the thoroughbred. To the cover of Belmont, by Alexander's Abdallah, dam Belle, hy Mambrino Chief, she produced Nutwood, 2:18¾, and Cora Belmont, 2:24½. All these three of her produce partake most strongly of trotting blood.

St. Julien, 2:11¼, is by Volunteer, son of Hembletonian, out of Lady Patriot, by Young Patriot; dam Flora, by Harry Clay, son of Neave's C. M. Clay, dam by imported Bellfounder. In him the trotting strains predominate, and he too is a campaigner and pure-gaited horse.

Rarus, 2:13¼, is by Conklin's Abdallah, believed to be, with a strong degree of probahility, a son of Old Abdallah, dam Nancy Awfnl, by Telegraph, son of Burr's Napoleon; grandam Lady Hunter, by Vermont Black Hawk. Rarus was a campaigner of campaigners. A stout and improving horse.

Goldsmith Maid, 2:14, is by Alexander's Abdallah, dam by Old Abdallah. She was one of the greatest trotters this country ever had, getting her best record in her seventeenth year.

Clingstone, 2:14, is by Rysdyk, son of Rysdyk's Hambletonian, out of Lady Duke, hy Lexington the thoroughbred, dam Gretchen, hy Chosroes; grandam Lady Fallis, by Seely's American Star; great grandam by L. I. Black Hawk. In him the trotting element snrely predominates, controlling the conformation and instinct, but the warm blood of the great racehorse has done him no harm. Clingstone started the past seasou well, but was nnfortunately thrown out of training. His brief career has shown that he is of the right kind.

Hattie Woodward, 2:15½, is by Aberdeen, son of the Old Horse, dam not traced. Aberdeen was out of Widow Machree, record 2:29, by American Star. Widow Machree was a noted mare in her day, and imparted her finest qualities to her son Aberdeen. Hattie Woodward was one of the sensational performers of 1880, and proved herself stout and lastiug.

Darby, 2:16½, is by Delmonico, son of Guy Miller, by the Old Horse, dam by Glencoe; Delmonico's dam was the Harvey Adams mare, by old Hambletonian, grandam by imported Bellfounder. Guy Miller's dam was hy Nanny's Bolivar. Darhy, therefore, has a double cross to Hambletonian against the Glencoe strain. He was a great campaigner in the hands of that master, Dan Mace.

Edwin Thorne, 2:16½, is hy Thornedale, 2:22¼, son of Alexander's Ahdallah out of Dolly hy Mambrino Chief; dam by Ashland, son of Mambrino Chief; grandam by Eureka, son of L. I. Black Hawk. Ashland was out of Utilla, by Margrave, the thoroughbred. True to his fine hreeding Edwin Thorne is a horse of thorough trotting conformation, is very fast, aud is a stayer. He was one of the great horses the past season.

Jerome Eddy, 2:16½, is hy Louis Napoleon, son of Volunteer out of Hattie Wood, hy Harry Clay; dam Fanny Mapes, by Alexander's Abdallah. Hattie Wood also produced Gazelle, record 2:21, to the cover of the Old Horse. Jerome Eddy was the best entire horse of 1882, trotting a numher of hard races against old hands. He has endurance and great will power.

Gloster, 2:17, was hy Volunteer, dam Black Bess, by Stockbridge Chief, son of Vt. Bleck Hawk; grandam by Mamhrino Paymaster. Gloster was one of the most promising horses of his time. He was pure-gaited, an all-day fellow, and had the longest stride of any horse contemporary with him. Gloster died hefore he had the opportunity to show what he was capable of, bnt had in him the elements of a great trotter.

Dexter, 2:17¼, is by Old Hambletonian, dam Clara, by Seely's American Star. Hamhletonian crossed hest on American Star mares, and he never got a better one than Dexter. Dexter in his prime had no superior. He was a stout, never-failing horse, and eyen now in his old age, is as lusty and strong as many a horse considerahly his junior. Clara, his dam, also produced Alma, 2:28¾, to the cover of the Old Horse.

Piedmont, 2:17¼, is by Almont, son of Alexander's Abdallah, dam Mag Ferguson, by Mamhrino Chief, grandam by Grey Eagle, the racehorse. Almont's dam is hy Mambrino Chief, grandam by Pilot Jr. There is a splendid combination of trotting blood in Piedmont. A douhle cross to Mambrino Chief, one to Hamhletonian and one to Pilot Jr., helped him to win a number of hard-fought contests. He is now in the stud, but is able to stand another hard campaign.

So-So, 2:17¼, is by George Wilkes, son of Hambletonian, dam Little Ida, by Alexander's Edwin Forest. The dam of George Wilkes was by Henry Clay, the founder of the family. George Wilkes, with a record of 2:22, was himself a great campaigner. As a sire of trotters he stands in the front rank, seven of his get entering the 2:30 list the past season. So-So is a worthy daughter of her great sire.

Santa Claus, 2:17½, is by Strathmore, son of the Old Hero out of Lady Waltermire, by North American; dam Lady Thorne Jr., by Williams' Mambrino, son of Ericsson, by Membrino Chief; grandam Kate, hy Highland Chief, son of Mamhrino Chief. Here again is another combination of the potent Mamhrino Chief blood. Santa Claus has been several seasons on the turf, improving each year. He is a stout, reliable trotter, has withstood the weakening influences of climetic changes, and was one of the principal attractions in the Grand Circuit of this year. We saw him trot the gamest kind of a race at Boston for the $10,000 purse last September, and a lame horse at that. It is said that John Turner

will handle him next season, and we are inclined to think tha General will never sit hehind a much hetter one.

Nettie, 2:18, was got hy Rysdyk's Hamhletonian, dam the County Housa Mare, by Seely's American Star. Nettie was another good one of tha Hambletonian-Star comhination. She was a good campaigner.

Dick Swiveller, 2:18, is hy Walkill Chief, dam Madame Swiveller, hy Henry Clay Jr., son of Henry Clay; grandam Old Tad, hy Rattler, son of Abdallah. Trne to his hreediug and characteristics, Dick Swiveller, while hefore the public, was a sensational horse. He was some seasons on the turf, and was never outclassed. He is now a mate to Edward, and bas the honor of trotting a mile with him in 2:16¾, one and a quarter seconds faster than his record in harness.

Great Eastern, 2:18, is also hy Walkill Chief, dam by Riley's Consternation Colt, son of imported Consternation; grandam by Ferguson's Old Kentucky Hunter. As a campaigner Great Eastern was not a shining light. He is a very large horse, and not cast in the mold of a thorough going trotter. As a saddle horsa he was a hetter performer than in harness, getting a record of 2:15¾.

Judge Fullerton, 2:18, is by Edward Everett out of Fanny, by imported Margrave, dam uot traced. Judge Fullerton is one of the uotable exceptions. He is a horse of decided trotting conformation. He was an ahle campaigner, a horse of great suhstance, and very speedy.

Robert McGregor, 2:18, is hy Major Edsall, son of Alexander's Ahdallah out of a mare by Harris' Hambletonian; dam Nancy Whitman, hy Seely's American Star; grandam hy Durland's Young Messenger Duroc. Robert McGregor was au ahla borse while on tha turf. He trotted several seasons in the hest company, and retired with a reserve of speed.

Midnight, 2:18¼, is hy Peacemaker, son of Hamhletonian, out of Sally Feagles, hy Smith's Clay, son of Neave's C. M. Clay Jr.; dam hy tbe Drew Horse; grandam by Witherell Messeuger. Midnight has always been a first-class first-money horse. He is resolute, fast, and of great endurance. 2:18¼ is not the limit of his speed.

Monroe Chief, 2:18¼, is by Jim Monroe, son of Alexander's Ahdallah, out of Lizzie Peeples, hy Wagner, tha racehorse; dam hy Bay Chief, son of Mamhrino Chief; grandam hy Toronto, son of St. Lawrence. Monroe Chief was a sensational horse from his first appearance upon the turf. He has trotted soma of the hest contested races tha puhlic have ever witnessed. This fall he heat Rosa Wilkes in a hard-fought race of six beats—his first contest for the year—and a few days after trotted two miles in 4:46, the hest on record. He is a game horse, of true conformation, level-headed and of great suhstance. His record in harness is hy no means his limit.

Fanny Witherspoon, 2:18¼, hy Almont, dam by Gough's Wagner, is one of the hest of Almont's get. She is a very blood-lika mare, of fine trotting action. She started several seasons ago in good company, and has been a good campaigner.

Pickard, 2:18¼, by Abdallah Pilot, dam by Bourhon Chief, is another member of the tribe that has shown his hreediug. He is also inhred to Mambrino Chief. Ahdallah Pilot is a son of Alexander's Ahdallah, out of Blandina; hy Mamhrino Chief, grandam the Burch Mare, by Brown Pilot. Blandina also produced Swigert, the sire of Calamus, George K, and Resolute. Bourhon Chief, tha son of Mamhrino Chief, got Calmar, 2:22. Pickard is a very speedy, game horse. He was several seasons on the turf, improving each year.

Rosa Wilkes, 2:18¼, by George Wilkes, dam by Mambrino Patchen, is ona of the best campaigners that ever stepped upon a track. She is credited with having trotted over 100 races in the best company, with a large list of winnings. She is brad just right for downright hard work. At the tail eud of the past season she was heaten in a bruising six heat race by Monroe Chief, but the defeat took nothing from her prestige.

William H, 2:18¼, by Young Wilkes out of a mare by Princa of Wales, son of Royal George, dam by Daniel Webster, son of Casius M. Clay, is an old campaigner. He has heen some seasons on the turf, and is now one of tha most valued members of Mr. W. J. Gordon's stables.

Cleora, 2:18¾, started a green mare the past season. She participated in but few racas, but at once leaped into prominence. Cleora is hy Menelaus, son of Hambletonian, dam Tborneleaf, by Mambrino Patchen, grandam Dandy (dam of Silver Duke, 2:28¾), hy Young Enginear, the sire of Lady Suffolk. Menelaus was out of Jessie Bull, by L. I. Black Hawk. Cleora is by right a trotter. As she is now in the hands of a private gentleman, it may never be known whether she will make a great campaigner. She is bred for it however.

Nutwood, 2:28¾, by Belmont, dam Miss Russel, the dam of Maud S, is a first-class entire horse. He has shown his ahility to train on aud can beat his record.

Alley, 2:19, by Volunteer, dam by New York Black Hawk, son of L. I. Black Hawk, grandam hy Mambrino Paymaster, the sire of Mambrino Chief, waa an improving horse while on the turf. He placed 46 heats in 2:30 or better before his retirement.

Kitty Bates, 2:19, by Jim Monroe, dam Pop Corn, not traced. Kitty Bates was au ahle campaigner, and was ona of the shining lights of the season of 1880.

Jay-Eye-See, 2:19, by Dictator, dam Midnight, by Pilot Jr., is the greatest four-year-old the American trotting turf has produced. Dictator is a full brother to Dexter, and old Clara never produced a mean oue. Midnight also produced Noontide, 2:20¼, and is out of Twilight, by Lexington. Jay-Eye-See is a small horse, of trua conformation, compact, true-gaited, and is confidently expected to improve in his fiva-year-old form, as he undoubtadly will.

Adele Gould, 2:19, by Jay Gould, dam Emeline, hy Henry B. Patcheu, son of George M. Patcheu, ia tha best five-year-old in the list. Sha trotted a number of hard races this season, and got her record well on towards the closa. Jay Gould is out of Lady Sanforô, by Seely's American Star. Emeline also produced Kate Taylor and Ray Gould, both very speedy, to the cover of Aberdeen and Jay Gould.

Edward, 2:19, by Masterlode, aon of the Old Horse, dam by Bacchus, was au able campaigner. Masterlode'a dam was Lady Irwin, by Seely's American Star. Edward, as a mate to Dick Swiveller, trotted a mile in 2:16¾, improving on his harness record. He is still an able horse, and is claimed to ha able to beat his record.

Wedgewood, 2:19, by Belmont, dam Woodbine, by Woodford, thoroughbred son of Kosciusko, started several seasona ago, and was an able campaigner, although ha carried weights. He is not what is called a true-gaited horse, needing artificial appliances to keep him level. He, however, held his own in good company. Woodbine produced Woodford Mambrino, 2:21½, a great horae.

Bodine, 2:19¼, by Volunteer, dam by Harry Clay, was a good horse in his day. He trotted some seasons, winning a great many hard races.

Aldine, 2:19¼; by Almont, dam Mother Hubbard, by Toronto, of St. Lawrence stock. Aldiue has always been a fine performer, training on and improviug. She is very blood-like, of good conformatiou aud very speedy.

Von Arnim, 2:19½, by Sentinel, dam Mary Short, hy Blood's Black Hawk, graudam hy Downing's Bay Messenger, is a very speedy stallion, a stayer, and a good campaigner. Sentinel is a full hrother to Volunteer, and had himself a record of 2:29¾.

Driver, 2:19½, by Voluntcer, dam Silvertail, by American Star; grandam by Wildair, sou of Hoagland's Grey Messenger, is ona of the hest year-in-and-year-out horses on the American turf. He started in 1876, and has heen hefora the puhlic ever since. Ha is a thorough trotter, game and enduring. Driver has won a fortune for his owner.

Daisydale, 2:19¾, is by Thornedale, dam Daisy, hy Burr's Washiugton; grandam hy Old Ahdallah; great grandam hy Engiueer 2d. Daisydale while ou the turf proved herself a worthy daughtar of Thornedale. She was very fast.

Nancy Hackett, 2:20, by Wood's Hambletonian, dam the Hackett Mare, pedigree unknown, was a great campaigner. Sha was one of tha attractions of the Grand Circuit, and a first-rate money horsa. Her dam, tha Hackett Mare, also produced Argonaut, 2:23¼.

Orange Girl, 2:20, hy Rysdyk's Hamhletonian, dam Dolly Mills, hy Seely's American Star, was a very ahle mare. She trotted several seasons, improviug with expcrienca. She was level-gaited and very fast.

Prospero, 2:20, hy Messenger Duroc, dam Green Mountain Maid, by Harry Clay, grandam Shanghai Mary. Prospero was a very fast, improving horsa. His dam also produced Dame Trot, 2:22, and Elaina, 2:20.

Graves, 2:20, hy Whipple's Hambletonian, son of Guy Miller, hy The Old Horse; dam Rose Austin, of unknown hreeding. Graves was fast aud trotted a numbcr of good races in California.

Elaine, 2:20, by Messenger Duroc, dam Green Mountain Maid hy Harry Clay. Elaiue is a very speedy and resoluta mare. She showed herself ona of the right kind at an early age. Her record of 2:20 was mada when six years old.

Tha hlood elements in the direct female line stand in the following order: Daughters of American Star hred to Hamhletonian sires contrihuted fiva to tha 2:20 list. Daughters of Harry Clay gave four, Green Mountain Maid furnishing two. Pilot Jr. mares contrihuted three, Miss Russell furnishing two. Mamhrino Patchen has two daughters which have given two to the list. In tha second or third removes, the Mambriuo Chiefs number five, one heing out of a daughter. The rest ara distrihuted among tha Clays, Vt. Black Hawks, Edwin Forrests, L. I. Black Hawks, and threa inhred. As a cross upon Hambletonian blood for stout, speedy and lasting trotters, tha Mamhrino Chief element seems the hest. The power and good heart of the last named is aided hy the action and speediness of the former. It is a combination which trains on and improves. Witness Edwin Thorne, Piedmont, Santa Claus, Monroe Chief, Pickard, Rosa Wilkes and Aldine, all campaigners of undoubted ahility. Of the Hambletonian sires represented in the 2:20 list, six have records of 2:30 or hetter, namely: Thornedale, 2:22¼; George Wilkes, 2:22; Major Edsall, 2:29; Jay Gould, 2:21½; Young Wilkes, 2:28¼, and Sentinel, 2:29¾; Thornedale and George Wilkes got two each. The Old Horse without a fast record got three, and so did Almont. Volunteer, tha best son of Hambletonian, heads tha list with five, got from Clay, Morgan, Star, and L. I. Black Hawk mares. Walkill Chief, also without a record, has two.—*New York Sportsman.*

The Next Military Rifle Match.

The Secretary of tha National Rifle Association anuouuces that the return International Military Rifle Match will take placa at Wimbledon, England, in July, 1883. The regulations for the selection and government of the American team are the same as those of the last, but special rules have been agread on as to the rifles to be used. The weapous must be military breech-loaders, fitted with an arraugement for fixing sword or bayonet and not to weigh, without such sword or bayonet, more than nina pounds four ounces. They may be from 48 to 55 inches long. The rnla for sights is as follows: Backsight to be attached to the barrel in front of the lock with a military wind-gauge; graduations on tha flap only; the sliding-bar to be with or without permanent vertical lines or apertures, and the upper edge either straight or with a notch; the outside measurement of the part on which the flap or leaf rests must not exceed one inch. Foresight to be of Government pattern called "barley corn." May be temporarily blackened or whitened. Backsight, may be tilted forward or back, and may be supported at the necessary angle by any extemporized means; the sliding-bar may be reversed and may be used on either side of the uprights. No additiou of permanent lines to one fine one down the center for Snider and threa for Martini-Henry will be allowed, but temporary marks or lines of any kind, removable at pleasure, may be usad; detachad "verniers" or "sight-elavators may he used.

A meeting of the Board of Directors of the National Rifle Association was held Jan. 2d, and the secretary, Mr. Seabury, read a letter from Mr. Edmond St. John Mildmay, the secratary of the National Rifle Association of Great Britain. He says further that tha council is sorry "that they cannot comply with your request to have the shape of the barley-corn front sight altered as they deem it important that this should be of sufficient strength to stand rough wear." A committee from tha present board of directors recommended the uames of the following gentlemen for the board of directors for 1883: General G. W. Wingate, Colonel J. G. Story, Colonel John Ward, Mr. F. J. Donaldson. Colonel Schermerhorn and F. T. Rahbeth.—*New York World.*

Last Saturday's *Breeder and Sportsman* is a capital number, the end of the first half year. Tha firat page is a colored picture of Alhert W, one of California's celebrated trotters. And there was also another half-sheet picture entitled, "Boya in Troubla"—two youngsters having mounted a horse barehack, lost their hold of the halter, and the animal atartiug off on a lively trot. Two faithful dogs appear to take in the uncomfortahle situation of tha boys and are watching the proceadings with much interest.—*Oroville Mercury.*

A Useful Article.—Rawson's United States Army Suspensory Bandaga is, as the cut connected with the advertisement elsewhere clearly shows, a complete reliaf and support, and ahould he in general usa. It is self-adjusting, and displacement ia impossible. It counteracta nervous tension and other ills that mankind ia heir to. Sold by all druggista. Can be sent by mail safely. Address S. E. G. Rawson, patentee, Saratoga Springs, N. Y.

About ona thousaud pounds of aturgeou is hrought to this city every week by one person, who catches them near tha cut-off between Sonoma and Napa. He reports that the fish are not unusually plentiful.—*Vallejo Chronicle.*

At the shooting of the San Francisco Schuetzen Verein, K. Wertheimar won the first prize with 26 points.

HERD AND SWINE.

Bull Butter in Politics.

Tha Watsonville *Pajaronian* asks if we ara to have an oleomargarine party iu California, and calls attention, as a cause for its question, to tha fact that most of those who took part in tha recent hull hutter hanquet at the Palace Hotel wera men identified with the politics of the State. The same paper gives puhlication to an improhahle rumor about the establishment in the near future of an oleomargarine factory in the Pajaro valley and another about one of the capitalists of the spud metropolis heing ahout to become the hull butter hoss of Mexico, Arizona aud other territory to the southward of us. Tha latter matter is of no moment, especially as the San Francisco oleomargarine company has the patent right to use the Mege process throughout the Pacific Coast States and Territories. But the first question is of importance.

The bull butter question will be a political one so far as regards the matter of legislation to prevent the palming off of the bogus article for genuine butter. The dairymen will present their proposad law, and it will probably he opposed with vigor, for thera is no denying the fact that tha oleomargarine party has abundant fuuds and a disposition to "put them where they will do the most good." In view of tha fact that the dairymen must expect vigorous opposition they should occupy tha hest obtainahle vantage ground in presenting their case. The rejection of the Gaffey resolution was a mistake which ought to he rectified. The fact that while demanding that oleomargarine be offered for sale only under its true colors the dairymen rejected a proposition to demand a law compelling the maker to stamp the true weight on each roll of butter has already heen made a handle of by tha newspapera which champion the hull butter cause, and it will surely ba thrown in their faces at Sacrameuto when they demand the passage of the proposed oleomargarine law.

This question of false weights and measures is an important one. Older governments have heen ohliged to appoint weight and measure inspectors, aud we may yet have to follow suit. It is a notorious fact that not only roll butter hut nearly evary article which we purchase in packages is put up short of the alleged weight. Buy a 5-pound can of deep sea mackerel and put it upon the scales and you will see that it weigha hut 3½ pounds; a pound of coffee is usually hut 14 ounces; a 10-pound tin of California lard contains but 9 pounds; there is a hrand of lard from the East, known to the trada as "cutthroat lard," which is much shorter in weight than this. A general move for the redress of these avils, which apply to nearly every other article of food as well as to thosa we have named, is imminent, and it ought not to catch the dairyman of this State napping.

It is not out of place for the dairymau to make the demand, either, for the present short weight system as applied to roll butter, instead of being a benefit to the dairyman ia a positive injury. Hia butter ia weighed in bulk by the commission merchant in this city, and he gets paid for no more butter than he sends, be the rolls large or small. But he pays freight on 100 pounda of hutter for each 90 pounds of short weight rolls shipped. He would save the difference in freight and lose nothing in receipts for butter sold by tha change, while he would be able to go before the Legislature with clean hands when asking legislation to protect himself and the public from fraud in the sale of oleomargarine.

Since the members of the Association dispersed from the recent convention there bas been time for them to think the matter over, and many of them must by this time realize that tha rejection of tha honest-weight resolutiou was a mistake. It is quita probable that were the convention called together again the resolution, or one of similar import, would be passed and the committee which has the preseutiug of the bill under its management would be freed from one of the difficulties uow in its way.

The passage of the law as proposed by the convention would he a great point gainad, but, as the Breeder and Sportsman has heratofore remarked, the passage of that law, without material and injurious amendmeut, is extremely problematical, and any legislation to compel the stamping and branding of oleomargarine will be futile as a means of preventing fraud in its use ao long as it may be served to the patrons of hotels aud eating-houses without their being notified that it is not dairy hutter.

Our exchanges continue to tell of the ravages of blackleg among the cattle in the northern part of the state. This is a disease difficult to combat. Its symptoms iu different localities and under different climates vary considerahly; indeed, aoma of the hest authoritiea have been unable to agree as to whether what has been considered the same disease in different localities is identical or a distinct and separate affection, and a spirited discussion on the subject between acientists has been going on, to reports of which the Breeder and Sportsman has given considerable space. The remedica, too, which have been efficacious in some places have heen futile in othara. A treatment which has been attended with considerable success in this State is to make a deep incision in the foreleg below the knee aud rub in a quantity of black pepper, aud wa cannot agree with the *Evening Post* of this city which aaserts that however efficacious this treatment may be the animals, could they have their choice, would probably prefer the blackleg. The remedy though a severe one ia not what might be called a "heroic remedy," and men often submit to more painful operationa in the treatment of dangerous ailments than hlackleg.

Swine Statistics.

The hog is the product of Nature's most economical thought. There is no part that cannot be utilized. His flesh, fat, bristles, hair, hoofs and bones, are all turned to account. "The divisions of the nuctuous body," says Alpacius, "are as familiar as the divisions of the earth. His ears and feet go to souse; his brains are a choice dish for the epicure. His tail has for ages been claimed by successive ages of children as their peculiar property. Tradition points out how to appropriate it: roast on the coals, take it in the fingers and eat with salt.

The hog is the staff of life—the arch enemy of famine—the poor man's best friend. Moreover, in his earlier days he is strikingly frisky, cunning and graceful—as much more interesting than a human infant of the same age as the latter is more interesting than so much putty. In adult pighood he is omniverous and self-reliant, bold and expeditionary; and he breeds faster, grows faster and keeps cheaper than any other domestic animal.

America is pre-eminently the home of the hog—he is a logical deduction from Indian corn. He was introduced into Virginia in 1609, and there he multiplied so rapidly that the colonists were obliged to palisade Jamestown—high to keep out the Indians, and close to keep out the hogs.

The United States Agricultural Report gave the number of hogs over six months old in the country in 1870 as twenty-six and a half millions, worth $7 each, or $187,000,000. In 1880, according to the census, there were of all ages 47,683,951 head, worth at $5 each about $238,419,755. Of this number, Iowa, with its 6,034,316, was far in the lead of any other State; Illinois came next with 5,170,266; Missouri third with 4,553,123; Indiana fourth with 3,186,413, followed closely by Ohio with 3,141,333. These five States, with Kentucky added, contained more than half the hogs in the Union. Wyoming, where the women vote, had only 567 of all ages, sexes and colors. Seventeen States had more than a million each, namely, Alabama, Arkansas, Georgia, Illinois, Indiana, Iowa, Kansas, Kentucky, Mississippi, Missouri, Nebraska, North Carolina, Ohio, Pennsylvania, Tennessee, Texas and Wisconsin.

Fifteen years ago the total annual receipts of live hogs at all the principal pork centers were 3,958,000 head, while in 1880 Chicago alone received almost twice as many. I presume it is safe to say that the majority of persons have always had a vague idea that Cincinnati somehow was and is the great pork and hog market of the world; that it is a large city whose inhabitants are mostly packers, dealers in and shippers of hogs and their products; that it, of all places on this planet, is the great porkopolis, where houses and streets are filled with hogs, alive and dead, and the sidewalk redolent of blood, bristles and bologna. Fact—which is stranger than fiction—reveals that fifteen years ago Chicago was handling three hogs to Cincinnati's one, and in 1880 almost nine times as many were marketed in Chicago as in the Queen City, while New York, Buffalo, Indianapolis and Kansas City all surpass her in receipts of swine. As to packing, Chicago in the year ending March 1, 1882, carved and cured upwards of 5,100,000,—more than ten hogs to one slaughtered in Cincinnati—and during the same period Kansas City, the young giant of the New West, packed 810,000—more by fifty per cent. than Cincinnati or any other place except Chicago.

The heaviest net average for sixteen years past—which is all we have reliable record of—of the hogs packed in the United States in any one season was 232½ pounds in the season of 1872-3; it was almost as much in 1866-67, while the lightest was in 1867-68, when the average was only 201 pounds. In 1873-74 the average of lard per hog was a fraction over forty pounds, while the lightest average, only twenty-nine pounds, was noted in the year 1867-68. It is of interest to note weights of the hogs packed at different points, and I have chosen an average of those slaughtered during the winter of 1881-82. Those at—

Chicago	weighed, gross,	271	pounds.
St. Louis	" "	253	"
Milwaukee	" "	270	"
Louisville	" "	250	"
Indianapolis	" "	246	"
Kansas City	" "	246	"
Cincinnati	" "	264	"

Their average weight, dressed, was: at

Chicago	216	pounds.
St. Louis	303	"
Milwaukee	216	"
Louisville	200	"
Indianapolis	197	"
Kansas City	196¾	"
Cincinnati	211	"

Those slaughtered at these different places yielded lard per hog as follows:

Chicago	39½	pounds.
St. Louis	35	"
Milwaukee	33½	"
Louisville	29½	"
Indianapolis	29¼	"
Kansas City	37	"
Cincinnati	36¾	"

Among the peculiarities of these comparisons are that, while the Chicago and Milwaukee hogs differed only a pound in gross weight and dressed exactly 216 pounds each, the Chicago hog yielded about 22 per cent. more lard; the St. Louis hog yielded about five per cent. more lard than the 270-pound Milwaukee hog; and the Kansas City hog, of 246 pounds, the same weight as the Indianapolis porker, affords 24 per cent. more shortening, which is equaled by no other except the Chicago hog that weighs just 25 pounds more and yields two and a half pounds more lard.

The average net weight per hog, of nearly 6,000,000 head packed in the season of 1881-82 was 307¾ pounds, and of lard per head was 35½ pounds.

The lowest yearly average price of lard per pound in the Cincinnati market in 36 years was in 1846, when it averaged throughout the year a little less than 5½ cents; the highest throughout the year 1865, when it averaged 20.55 cents. The lowest average price per barrel throughout any year for pork was $8 50, in 1846; the highest average price paid throughout a year was $32 95 per barrel in 1864, during the months of which it varied all the way from $20 25 to $43 35 per barrel.

As to the pin-money that the hog brings to this country I will say that the Treasury department reports that for the year ending June 30, 1881, there were exported hog products valued at $106,000,000. The same report shows the exports of other animals and their product in the same period, and I find that by taking all the cattle, the horses, the sheep, the mules, the fresh salt beef, the butter, and hair, tallow and hides, the cheese, glue, and horn combs sent abroad to alleviate the hunger and other wants of Europe's teeming millions, they foot up $55,000,000, or a fraction over half as much as we realized on the hog trade. The exports of the year following were about 20 per cent. less in both classes, but [illegible] to each other about the same ratio, except that for [illegible] period the swine account is to be credited with $11,[illegible] we took in for bristles.

The United States Agricultural Department publishes the estimated value of the hogs over six months old in each state in January, 1880, in which the variations are somewhat surprising. In Massachusetts the value per head is set down at $12 46; further south, in Florida, the hogs are rated at $2 33 each, and no doubt it is a liberal estimate; Mississippi is higher up in the scale and hogs average at $2 70, and Texas shows up with nearly two millions of $2 55 hogs, while Oregon goes her a nickel better. Iowa's millions are figured at $5 36 each; Illinois' at $5 61; Kansas at $5 28, and Missouri, located between the two, is allowed but $3 44 per head, and yet within her borders are some of the finest that ever rested on glad earth's bosom.—*F. D. Colburn.*

In-and-in Breeding.

The English papers are beginning to advise their breeders of thoroughbreds, says the *Michigan Farmer*, to go outside for an infusion of new blood, and point out that the success of the American horses now in England entitled them to be considered fully the equals of any in the world and that no deterioration in form or quality need be feared from such action. It is hinted at the same time that the English have bred too closely and that the consequence is a lack of stoutness in the stock. While there is no doubt a falling off to some extent in the stoutness of the English race horses as compared with thirty or forty years ago, it is more owing, we believe, to the system of early training, the sacrifice of stoutness to speed to meet the requirements of the four or five furlong and mile races, and the hot-house system of forcing they have followed so as to be able to bring their animals to the starting post long before they would have matured or acquired the form and endurance necessary to a racehorse in a natural way. In-and-in breeding is frequently held responsible for anything that the breeder cannot understand. There is not a single domestic animal of superior excellence that is not indebted to this very system for its most valuable characteristics.

The racehorse, the various improved breeds of cattle, sheep, swine, dogs and poultry, have all been improved by in-and-in breeding, and those who have acquired fame as breeders have invariably done so adhering to this principle. There are undoubtedly many cases where in-and-in breeding may become positively hurtful but the judicious breeder can easily avoid them. If a breeder has an animal of peculiar excellence how can he retain and fix his excellence upon the animals he is breeding except by following this principle? Where an animal is faulty, in-and-in breeding will just as surely fix those faults into a type as it will fix good qualities. A judicious breeder would avoid such a mistake as this, and it is the judgment that enables him to select proper animals to breed from, that is at the bottom of his success. In-and-in breeding is absolutely necessary, and is not hurtful if the animals chosen are free from blemishes and have only good qualities to impart to their offspring. It is positively hurtful where the animals are ill-formed or lack constitution. Bad qualities can be bred into an animal just as readily as good, and in-and-in breeding will fix the one just as surely as the other.

Feeding Value of Ensilage.—We have inquiries concerning the feeding value of ensilage, some of which show some confusion of mind on the subject. Bearing in mind a few general principles will help to a better understanding: 1. The value of food preserved in a silo depends very greatly on what was put in—its nature and condition. The material used and the degree of maturity of the crop will greatly affect the value. 2. Putting grass, cornstalks or any other substances into a silo does not add anything to the nutriment contained in the material. We cannot take out what we did not put in. Cutting and storing the green food in a silo may make it more digestible; may and often does make it more palatable than when the food is dried in the open air. Letting the moisture dry from meadow grass or from green cornstalks, in itself, should not make these substances less desirable as food. In fact, it does make them less palatable. Preserving much of this moisture in the ensilaged food may be a help. 3. If fermentation goes on in the silo to any considerable extent there is absolute loss of food value. 4. Reason and experience alike lead us to conclude that we cannot make ensilaged grass or cornstalks alone fully take the place of good grain feed. The latter should be given in connection with the former. 5. Reason and experience alike show that almost any palatable, nutritious, succulent plant, kept in a silo, with reasonable exclusion of the air, makes a palatable and fairly satisfactory food.—*Breeder's Gazette.*

The Board of Directors of the San Mateo and Santa Clara Counties Agricultural Association No. 5 held their annual meeting at San Jose Dec. 27th. Mr. Jones, Chairman of the Committee on Grounds, stated that said committee had made arrangements with a like committee of the Santa Clara Society to lease the fair grounds for the ensuing year for $1,200—$800 cash and the balance to be placed on the grounds in permanent improvements. There being no further business, the board adjourned sine die. The new board immediately met for organization. Messrs. Abram King and Alex Gordon presented their certificates of appointment as Directors. W. T. Adel was chosen temporary Chairman and George Bement temporary Secretary. For President Abram King was unanimously elected. For Secretary and Treasurer T. S. Montgomery and W. D. Tisdale were elected respectively. The President appointed Directors Jones and Weller to act as a temporary Committee on grounds. On motion of Mr. Bement the President was added to said committee. The time for holding the next fair was fixed for the second week after the State fair. Adjourned to meet at call of President.

A man told his experience this morning in accumulating cattle, all the while complaining about the high price of beef, because it made cattle men so wide-awake and cautious in looking out for their stock. "Oh, yes, boys," he remarked, "when I lived at Winnemucca, I used to ship out every year and skirmish up and down the Owyhee, on a mere pleasure excursion, and in less than a month I would pick up four or five hundred head of two-year-olds that hadn't a brand or mark of any kind on them. Them were good times, boys; but now beef is so high that cattle men brand calves as soon as they are born, and it don't give a fellow any chance." Then he imbibed and wept over the rise in the price of beef. —*Reno Gazette.*

In making Petersburg butter, which is a popular European sweet-cream butter, the cream is heated to about 160 degrees, being frequently or constantly stirred. It is then cooled to a low churning temperature and quickly churned. The subsequent treatment of the butter is essentially different from the Danish. It is considered by connoisseurs much the finest butter made.

Structure of a Cow's Horn.

It is frequently the case, says Frank Buckland, that in the commonest objects we may see, if we like, beautiful examples of engineering structures. I take the anatomy of the cow's horn as a good example. A few days since I was inspecting the large tanneries of the Messrs. Hamlyn of Buckfastleigh, on the river Dart, Devonshire. In one of the back yards was a mountain of the skulls and horns of cows of all sorts and kinds. Here there was a treasure worthy of investigation; so I got on to the mountain of horns and skulls and picked out some beautiful specimens, which Mr. Hamlyn kindly gave me, in order to make sections, etc.

I find that over the brain of the cow a strong roof of bone is thrown, in the shape of an arch, so as to form a substantial foundation for the horns. It is not solid, however, but it is again strengthened below by a series of bony arches, that are so distributed as to form a series of hollow chambers, thus forming a structure uniting strength with lightness. The problem now is, how to fasten the horns on each side on to this buttress. The horn itself must be formed of horn proper, i. e., hardened hair. In the rhinoceros we find a horn composed entirely of a solid mass of what is really a bunch of hair, agglutinated together; but this kind of a horn would have been much too heavy for the cow's convenient use. What is to be done? Why, hollow out the center of the horn, of course; but stay—this will not do, because how is the horn to be supplied with blood vessels—in fact, how is it to grow? Let us see how it is done by the Great Designer. Cut the horn right across with a saw, and you will find inside another horn, only made of bone. If the section is made about one-third of the way down the length of the horn, you will be able to pick out a piece of bone in the shape of a cone, on which, or rather around which, the horn proper has shaped itself. This bone fits the cavity with the greatest accuracy; it is as light as the thinnest paper, and yet as strong as a cone of tin. It is everywhere perforated with holes, which in life contained the nerves, the veins and arteries, and we know a cow has all these in her horns; nerves, proved by the fact that cows do not like their horns touched, and that they can scratch a fly off their hides with the tip of the horn; arteries and veins, proved by the fact that a horn, when broken, will bleed, and that the horn of a living cow feels quite warm when held in the hand, besides which the nerves and arteries form a union between the internal core of bone and the external covering of horn proper.

If we now cut the rest of the horn into sections, we shall find that the inside of the bony part is really hollow, but that very strong buttresses of bone are thrown (about every inch or so) across the cavity of the horn in such a manner as to give it the greatest possible support and strength. I have cut a cow's horns and skull into several sections to show these buttresses of bone, and now that the preparation is finished, I have another specimen to show that there is design and beauty in all created objects.

Imitation Butter and Cheese.

In his address at the late Convention of the National Butter, Cheese and Egg Association, held at Milwaukee, President Belknap gave the following encouragement to his associate dairymen engaged in turning out only first class products to compete with imitation butter and cheese:

"It is well known that the agricultural mind has been considerably disturbed and agitated during the last two or three years by the appearance in the market of various compounds, which have been offered in competition with butter and cheese, as a substitute for the genuine article. Fears have been entertained by many of the more timid and cautious members that the dairy interest would materially suffer from this unwelcome competition. It has been a matter of general surprise to dealers, and in fact to nearly all those engaged in the dairy business, that the price of butter has ranged so high in spite of the persistent forcing of the various adulterations upon the attention of the consumer. The question is often asked, 'How does it happen that the price of butter holds up so high while so many substitutes are offered at much lower prices?' The answer almost invariably is, 'I do not know.' Well, gentlemen, that is my answer. One thing I do know, that is, that the average man will eat at a hotel table or at the table of a cafe a great deal more butter of good quality than of poor. The same rule holds good in families, if the table is liberally supplied. Children, if allowed to exercise their own judgment, will use it more freely if the quality is good. Ordinarily, goods are sold on their merit. The quality of your butter has been very much improved, and a corresponding improvment in the price is a natural consequence."

A cow will give more milk and make more butter on a bright sunshiny day than during one of a dull, dark character. The animal eats more heartily, digests better, while the vital forces are active during the pleasant day. These facts are not, in themselves, very important, yet they suggest the query whether close stabling of cows is better than giving them the run of a yard or pasture lot.

The excessive feeding of salt to cows to induce them to drink heavily, and thus hoping to increase the flow of milk, often acts in the opposite direction. The cow suffers from scours in the effort of nature to throw off the irritating substance, and meantime the flow of milk is diminished; smaller doses of salt stimulate secretions of all the fluids of the body, of course including milk. When the supply of salt is withdrawn the milk supply falls to its usual standard. There is no way of making a cow give more milk for any length of time by compelling her to drink water. On the other hand, if the cow is fed with green or steamed food, or that containing a due proportion of moisture, the increased flow of milk may be kept up so long as the cow will eat it, or until other demands divert her feed to different uses.

No kind of stock takes naturally to eating beans, possibly excepting sheep. In some cases even sheep have to be taught to like them. Beans, however, are too nutritious and valuable as a food to be thrown away. Discolored beans unfit for market may be ground and mixed with corn meal for hogs. These animals will soon learn to relish a nearly full bean ration. Where beans are boiled soft cows and horses will learn to eat them if mixed at first with oats or corn.

B. Guscetti's milk ranch, a mile and a half northeast of this city, is one of the best conducted in the State and the most extensive in the mountains. The milch cows now number 53 and are all in prime condition. The main stable is 300 feet long with two wings each 100 feet in length, and an immense quantity of hay and ground feed is always kept on hand. There are several hundred acres of lawn-like pasturage, well fenced. The new milk is put in cans that are partially immersed in a large stream of ice-cold spring water till, ready for delivery. No butter or cheese is made on the place, the customers getting the benefit of all the cream in the milk. Everything about the ranch is as neat as a pin. It has taken much money and labor to bring the enterprise to its state of perfection.—*Nevada City Transcript.*

CHEESE AND BUTTER.

Creameries, Butter Factories and Cheese Factories—Oleomargarine as a Competitor.

The creameries of the East are not, as many California people appear to imagine, simply established for the manufacture of cheese from skim milk and olein. The cheese factory is a place where milk is brought from a number of farms to be made into cheese by the use of the best and most improved appliances and practices, which would not be available to the individual farmers were they to make cheese themselves from their dozen, fifteen or twenty cows each. In some instances these factories are built by joint stock companies, the stock being distributed among the farmers who are to furnish the milk, and who each agree to furnish milk from a given number of cows during the season. Frequently, however, they are built by individuals who first contract with the farmers in the vicinity for the milk from a sufficient number of cows to make the factory profitable. Sometimes the farmers are to receive a percentage of the proceeds corresponding with the amount of milk they furnish, and sometimes they are paid a stipulated price per gallon; the former is the more frequent arrangement.

In addition to the advantage of securing the best quality of product by the use of the most approved machinery and methods, the factory system secures the advantage of marketing a large quantity at once, which assures a higher price than the individual farmers would be able to get for their product if they made the cheese at home, and also relieves the farmer of all the trouble and loss of time attendant upon the marketing of his product. The cheese brings a higher price than if it were from a dozen dairies and equal in average quality, and also because the buyer can make the purchase in a few minutes, whereas days might be occupied in securing a like amount from the farmers.

Among the advantages of the factory system over the individual manufacturing are the following, which are given as summed up by Prof. Arnold in an article contributed by him to the *Canada Farmer* in 1874.

There are always bands in every branch of manufacturing who outstrip their fellows in their respective arts. The labors of such men are of great worth in any calling, by reason of the increased value they give to the productions of their several arts above those of ordinary workmen. Factories can avail themselves of this superior skill; in families it would be impossible. The best workmen are few in number. Their number is altogether inadequate to supplying families, and the price of their skill would drive it out of nearly every private dairy. * * * Cheaper help must be employed in them, and, consequently, poorer goods turned out in the great majority of cases. The advantage gained by the application of skilled labor is generally enough to pay the entire cost of manufacturing. These advantages have proved a sufficient cause for factories supplanting private dairies to a very large extent. * * * The inequality in style and texture in dairies is very great, and is a serious obstacle in marketing. Such a heterogenous mass of goods as any considerable amount of dairy cheese must be would spoil it for any market requiring uniform quality.

In the article from which we have quoted Prof. Arnold states some of the objections to the factory system which partially offset its advantages. These are, the cost of carrying the milk to the factories, the injury to the milk by being carried in closed cans, thus confining the odor which should escape and which injures the flavor of the cheese and hastens its decay, and the difficulty of disposing of the whey without tainting the atmosphere of the factory so as to affect the product. These two latter objections have since been satisfactorily overcome by proper handling of the milk in transitu and by each farmer carrying home his portion of the whey, when he comes with his milk, and feeding it to hogs, so that the advantages in favor of the factory system are greater as practiced now than under the conditions of which Prof. Arnold wrote. Analysis shows that the milk from different dairies, under different conditions of feed, breed, etc., varies as much as 25 per cent., and here is where the greatest difficulty arises in the working of milk from different dairies in the factory and the apportionment of the proceeds.

Analysis of a fair quality of milk shows it to contain, in 100 pounds, 4.4 per cent. of caseine, 3.1 of olein and 4.7 of sugar. In cheese making a portion of the olein is lost, and it appears from investigation that more is lost when the night's milk stands till morning, and a part of the cream rises, than where the milk is manufactured into cheese without so standing.

It was during the decade which followed the close of the civil war that cheese factories came into general use in the New England and Western States, and it was not long ere some of the cheese-makers discovered that they could realize more money from a given amount of milk by letting a portion of the cream rise, skimming it off and making butter of it, and then making cheese of the remaining milk. Where the night's milk was skimmed in the morning and then that with the morning's milk made into cheese, the quality of the cheese was so little impaired that experts could not tell it from whole-milk cheese. Mr. W. L. Hunt of Rome, N. Y., in 1874, stated that from 8,000 pounds of milk he made $80 worth of whole-milk cheese. From 8,000 pounds of milk he then skimmed cream enough to make 80 pounds of butter and from the skimmed milk made 686 pounds of cheese. The butter and cheese brought, clear of the expenses of making, $92 60, showing a profit of $12 60 on 8,000 pounds of milk. It was such experiments as these that first led to the establishment of creameries, where a portion of the cream was taken from the milk and made into gilt-edged butter, and the remaining milk made into cheese.

It was about the same year that the above experiment was made that the first "artificial cheese" was made. Probably the first use made of the rendered olein from the intestinal fat for enriching skim-milk cheese was at Brooklyn in the latter part of 1873 or the early part of 1874. It was done surreptitiously and the product was marketed as whole-milk cheese. Then a factory at Utica adopted the practice, and others followed suit. By doing this a larger percentage of the cream could be removed and made into butter, and thus the term, "creamery," which was at first applied to an establishment for manufacturing butter to distinguish it from a cheese-factory, came to be applied to a cheese-factory which skimmed all the cream possible from its milk and made butter of it and then re-enriched the cheese with caul fat; and a genuine creamery, where butter alone was manufacture, came to be called a "butter-factory."

From that time on the manufacture of artificial cheese made rapid progress until now the Eastern cheese, which is so largely imported to California and sells here for a good, round figure over the market price of California cheese, is nearly all if not all made from skimmed milk and olein from the rendering-kettle. It may not be amiss to remark here that there is no reason why California-made cheese should not be as good as the best Eastern cheese. The fault lies entirely with the makers. When the Gilroy factory was running, its products were equal to the best Eastern, and sometimes superior thereto. The reasons already given for the superiority of factory cheese over that made in small dairies apply here. Want of skill, want of improved appliances, want of uniformity of product, all keep the price down. The time will come when California will no longer pay a premium for Eastern cheese in preference to the home product. Cheese factories certainly can be made to pay here if under the control of the right kind of men, and they will be, and California cheese-eaters will cease paying freight for bringing cheese several thousand miles, while living in the finest dairying climate on which God's sun ever shone.

Whether the introduction of beef fat into skim-milk cheese fails to make it of equal value with whole-milk cheese is still an open question though the price obtained here for the Eastern article manufactured in this way, in competition with California-made cheese, would cause one to infer that the compound is as good. There is no better test of comparative values of different products than steady competition in the market, and that test thus far rather favors the re-inforced skim-milk cheese.

Hitherto the manufacture of skim-milk cheese has not been attempted on this coast, but W. V. Gaffey, the first mover for the calling of the recent Dairymen's Convention, who conducts a large dairy ranch at San Andreas, near Watsonville, Santa Cruz county, intends, we understand, to soon commence utilizing the skimmed milk from his dairy by combining fat with it and making cheese. If his experiment proves successful he will no doubt soon have many followers and the market here for Eastern cheese may be destroyed by the introduction of a home product made in the same way, of equal quality, and which can be furnished at an equal profit, plus the freight from the East.

When the manufacture of cheese on the factory or co-operative plan began to grow in favor among Eastern dairymen there was much apprehension lest the increased production might glut the market and force prices down below a living figure. Experience has proven these misgivings unfounded. With increased production came increased consumption, and the healthfulness and nutritive value of cheese as an article of food began to be more generally understood than ever before. The press—not only the agricultural journals but the great daily papers, the health journals and the magazines—discussed it with the result that, though the production of cheese in the United States has immensely increased, the demand has kept pace with it, and more.

When the cheese factories became as popular as they soon did, farmers began to query if the same reasons which made co-operative cheese-making so profitable might not be as applicable to butter-making, and butter factories were established on the same principle as cheese factories. Experience soon demonstrated the fact that co-operation and intelligent manufacture in factories was more profitable in butter-making than in cheese-making, inasmuch as there is more difference between the price of poor butter and that of the best than between the best and poorest grades of cheese, and also inasmuch as any little carelessness or unskillfulness in the making of butter will make a greater difference in the quality of the product than it would in cheese. More uniform management and handling of the milk and cream throughout the process is possible in making butter in the factory than in the smaller dairy. The workmen at the factory have that and nothing else to attend to, and they give it the same attention every day and all the time. On the farm the making of butter is generally only a side issue, and frequently the cream is neglected for other and more pressing matters. The purchase of the most improved plans and appliances, the maintaining of an absolutely uniform temperature in the dairy room at all times, etc., are impracticable on the small farm, uniformity of product is consequently impossible and the highest price cannot therefore be obtained for the product.

Another advantage of the butter factory, and one of the strongest arguments for their establishment on this coast, is the fact that it relieves farm life of much of its drudgery. Too often the churning, or at any event the handling of butter after it leaves the churn, falls upon the farmer's wife. Farmers' wives, as a rule, have work enough—hard, wearing, backaching work—without being called on to make butter. Let the farmers in a community take their milk to a butter factory, properly managed, and the increase in price realized will, as has been remarked, often pay the entire cost of manufacture, leaving to the farmer and his family as clear gain the relief from the exacting labor of making butter.

It is not to be wondered at that much of the California butter sold in the markets of this city ranges from 8 to 12 cents lower than the best dairy butter. The butter is made during the week and put up in neat rolls for village consumption. When necessity calls the farmer to town he takes along what butter and eggs are at hand and sells them to the groceryman. The butter may be as sweet and fresh and delicious as gilt-edge butter ever is. The grocer puts it into a wire-cloth safe, along with that which has been brought in by half a dozen other country customers, and there it lies for a week or two, subject to the odor of codfish and bacon and onions and potatoes and other articles which he has to keep in the same room. And rest assured, if there is a taint or a smell anywhere within reach of the keenest olfactories that butter will pick it up. Butter has an affinity for odors that will discount the bloodhound. In the course of a week or two enough accumulates in the grocery store to make a shipment to market and the grocer sends off a lot of one, two or three hundred pounds, of all qualities, and it is sold to cheap restaurants in San Francisco at a price considerably below that of the best quality. Is it any wonder that oleomargarine made from clean fat, and doubtless as neat and wholesome as butter, finds a ready market? Is it any wonder that people who have eaten "store butter," i. e., that from country stores, until they have almost forgotten the flavor of the fresh, sweet butter which cannot be imitated, will swallow the bogus compound at the restaurant, "asking no questions for conscience' sake," nor for the sake of anything else?

The remedy for all this and the means of compelling oleomargarine to keep its proper place lies in the establisbment of butter factories—the employment of the best skill and most improved appliances and methods in the manufacture of butter, the production of a uniform and good article and the exercise of skill and care in placing it upon the market.

Oleomargarine has been in the field in competition with Eastern dairymen for ten or a dozen years, and the best dairymen—those who produce the highest quality of butter and make the most money out of their dairies—assert that it no more competes with them than do lard or candles. Their products reach a class of customers who have no use either for cheap store butter nor oleomargarine. The manufacture of the best butter is an art which requires both study and practical skill, but it is a sure protection against any injury to his business which the dairyman may apprehend from the manufacture of bull butter.

An effort will be made to have the present Legislature pass a law providing for the quarantining of diseased sheep wherever they may be found. The controversy now going on in regard to M. H. Cochrane's sheep at the Chicago Fat Stock Show, which Mr. Coffin alleges were affected with foot-rot, (and Mr. Cochrane in his reply does not deay the charge) and the prevalence of scab among the sheep in some parts of the country have created an interest in the subject. Legislation to prevent the spread of contagious diseases of stock is certainly much needed, and the subject of as much importance as was the "Bug Commission" law as it is called. But it ought not to be confined to sheep. If a State commission be established it ought to give attention to contagious diseases of horses and cattle as well as to those of sheep. Glanders ought to be guarded against as stringently as any disease to which sheep are subject; and if scientific and patient investigations could discover a means of averting pinkeye or divesting it of its more serious features, the time and expense would surely not be wasted.

Loss of cud or suspension of rumination in cows is due to indigestion, from inaction of the muscular coats of the stomach. The remedy is to clear the bowels and stomach of gathered undigested matter by a brisk purgative; for instance, a quart of linseed oil and twenty ounces of Epsom salts, and then give some easily-digested and laxative food, as bran mashes or linseed meal steeped in water twelve hours.

BASE BALL.

The Irwin Benefit.

The friends of "Sandy" Irwin of the Providence team turned out in quite large numbers to witness the benefit game of baseball at the Recreation Grounds Sunday afternoon. The two contesting nines were the Renos, assisted by Irwin, and a picked nine composed of players from both the Haverly and Niantic clubs. After the third inning had been played, both sides did such good playing that neither of them was able to add a run to the ones already made. The following is the score:

PICKED NINE.	T.B.	R.	B.H.	P.O.	A.	E.
Brown, r. f...	4	1	0	1	0	0
Levy, l f....	4	0	0	1	0	0
Morris, p....	4	2	1	1	10	0
Megan, 3 b...	4	1	0	1	0	0
F. Carroll, c..	4	0	0	10	2	0
J. Carroll, s. s.	4	1	2	0	1	0
Gagus, 2 b...	4	0	0	2	3	0
Pratt, 1 b.....	4	0	0	11	1	2
Knowlton, 1 f.	3	0	1	0	0	1
Totals.....	35	5	4	27	17	3

RENOS.	T.B.	R.	B.H.	P.O.	A.	E.
Swanton, c. f.	4	0	0	2	0	0
Feltz, 1 b....	4	0	0	8	0	1
Barnes, l. f...	4	0	0	0	0	0
Mitchell, p. and r. f....	4	0	0	0	1	0
Irwin, c. and 3 b.....	4	1	1	8	5	0
Sheridan, 2 b.	4	1	1	4	1	2
Sweeney, p. and r. f....	3	0	0	0	6	0
Donahue, s. s.	3	0	0	0	2	0
Lawton, 3 b. and c.....	3	0	0	5	1	3
Totals.....	33	2	2	27	15	6

Innings	1	2	3	4	5	6	7	8	9	
Picked Nine	2	1	2	0	0	0	0	0	0	—5
Renos	0	2	0	0	0	0	0	0	0	—2

Passed balls—Carroll 1, Lawton 4.
Three-base hit—J. Carroll.
Two-base hit—Morris.
Bases on balls—Picked Nine 3, Renos 0.
Umpire—J. Brown.
Time of game—Two hours.

ADVERTISING RATES.—Displayed $1 50 per inch each insertion or pro rata for less pace. Reading Notices set in brevier type and having no foot marks, 30 cents per line each insertion. Lines will average ten words. A discount of 10 per cent. will be allowed on 3 months, 20 per cent. on 6 months and 30 per cent. on 12 months contracts. No extra rate charged for cuts or cutting of column rules. No reading notice take for less than 60 cents each insertion.

San Francisco, Saturday, January 13, 1883.

Mr. M. J. Henley is a duly authorized traveling agent nd correspondent for the "Breeder and Sportsman."

PALO ALTO SECURES YOUNG PRINCE.

M. C. Fisher has sold the thoroughbred English racer, Young Prince, to Gov. Stanford, for $5,000.—*San Rafael Journal.*

We are much pleased to learn that this highly bred horse has been purchased for Palo Alto. His blood is of a kind that must prove valuable and so far it has been nearly lost although he has been in California for several years. Young Prince is by Knowsley, his first dam Queen of Spain, by King Tom, second dam Ma Mie by Jerry, and his third dam Fanchon by Lapdog.

Knowsley was by Stockwell, his dam by Orlando, Brown Bess by Camel his second dam, his third by Brutandorf, and his fourth Mrs. Cruickshanks by Welbeck. It is not necessary to extend the pedigree further to show what valuable strains there are, and good as are the immediate ancestors those further back are of equal importance. If we are not mistaken this is the first horse ever imported which combined the Stockwell and King Tom blood. Both are sons of Pocahontas by Glencoe—Stockwell, foaled in 1849, by the Baron; King Tom, foaled in 1851, by Harkaway.

Then Knowsley brings in the Orlando who was the sire of imported Eclipse, and the winner of the Derby in the year when Running Rein raised such a commotion. Orlando was by Touchstone from the wonderful speedy mare Vulture.

Thus in the pedigree of Young Prince are as many Derby and St. Leger winners as are usually found. The double strains of Glencoe through Pocahontas will be very likely to prove a good combination with those of the same sire inherited through his American progeny, and then there are outcrosses at Palo Alto that will give the opportunity to test both methods of breeding. The success that has followed the late importations in the East is an augury favorable for the union of the foreign and native at Palo Alto, and we have not the least hesitancy in predicting a series of victories for it in the future. While Young Prince is entirely "untried," reasoning from the advantages that have followed the mingling of similar strains as those which are to be united on this stud farm, there are reasonable anticipations of seeing many winners.

SECRETARY OF THE SENATE.

That our friend Edwin F. Smith has been chosen to fill the position of Secretary of the Senate gives us unqualified pleasure. There is always satisfaction in the advancement of those we regard, but in this case there is the added gratification of knowing that he is emphatically the man for the place.

He will enter into the duties with enthusiasm, and we have long been of the opinion that an enthusiast in most of the positions of life will outdo those of more phlegmatic constitution.

Mr. Smith is not only active, untiring and enthusiastic in everything he undertakes, as he has natural gifts of great value in the place he has been elected to. A good voice, pleasing manner, courteous and affable in all circumstances, and with experience in the line of his duties. The only instances where the *Breeder and Sportsman* has advocated the claim of any one for an elective office have been for the Speaker of the House and the Secretary of the Senate. There was not a particle of partisan bias in doing this, but, as has been heretofore stated it was for the furtherance of the branches of business in which we have so deep an interest. Doubtless the other candidates are men of ability, and we would be far from stating that they are inferior to the successful contestants. We are not acquainted with them, while from personal and intimate knowledge we can endorse La Rue and Smith.

THE OCCIDENT STAKES.

In another column will be found a list of the nominations in the Occident Stakes, and the officers of the California State Agricultural Society should certainly be pleased with the fine exhibit. It is not only gratifying to the association as every one who takes much interest in trotting affairs must also be gratified with the evidence of the progression in the breeding of that class of horses on this coast. It must be borne in mind that when stakes close at the time the colts rank as two-year-olds there is less chance for them to enter. A colt which has been highly thought of a few months before may have shown incapacity entirely unexpected, and the greatest promise so far as pedigree and form could show, may be found wanting on actual trial. Even with the greater certainty, in breeding the desired type, that arises in the case of thoroughbreds there are woful disappointments. Brothers and sisters to celebrities that ranked in the first class have proven to be so much inferior that any weight, in reason, would not bring them together, while the unfashionably bred one, that only brought a trifling sum at a sale of yearlings, evolves into a star of the first magnitude. With all the failures, however, the main thing to depend on is the breeding, and the trotting division is rapidly approaching the gallopers in this respect. Haphazard has given place to calculation, and the element of chance is eliminated so far as it is possible to throw Dame Fortune out of the calculation.

It is fortunate, nevertheless, that luck has something to do with the affairs of life and that the "glorious uncertainty" of the future lends the chief charm to the breeding of race horses and trotters.

The sires and dams embraced in the Occident and Stanford Stakes present an array that justifies the assertion that their superiors are not in any country. The only thing that can be disputed is the claim that would place them on a par with those that stand on the highest pinnacle of trotting fame. While there is none of the get of Harold, Volunteer or Almont, nor a son or daughter of Miss Russell, Green Mountain Maid or the dam of St. Julien, there is plenty of the blood, in many cases, derived directly from these sources. The nearly brother in blood to Maud S, Nutwood, has several representatives, there are mares by Volunteer and the get of Almont figures among the sires.

Electioneer has five in the Occident, General Benton four, Nutwood four, Sultan, Brigadier, Poscora Hayward, Buccaneer and Santa Claus each two. Those having only one to do battle for them are A. W. Richmond, Elmo, Steinway, Como, Western, Whipple's Hambletonian and Arthurton.

There is a preponderance of the blood of the hero of Chester, though every family of note is represented. Thirty such colts, without mishaps, must show something which will be well worthy of a long journey to see, and again we say that the Association has made a big strike in adding this stake to the regular programme. It would be still better to add other colt stakes from yearlings to four-year-olds, as well as gives purses for these classes. There cannot be anything more certain than that these colt stakes will grow in popularity with the public as well as giving breeders a better opportunity.

THE SPEAKER OF THE HOUSE.

We are well pleased to learn that H. M. La Rue has been elected to the speakership of the Assembly, feeling confident that the choice will inure to the benefit of the State. While more anxious on account of the breeding interests, there is the assurance that all will be protected and the "rulings of the chair" be in accordance with a determination to do exact justice.

The speaker exerts a certain influence and it not only requires that the incumbent be a man of sterling integrity, well-balanced mind, firmness of purpose, but also have that quality usually called magnetism, the power to govern without creating antagonism, and a knowledge of parliamentary law to keep the business in hand. All these qualities Mr. La Rue possesses and in addition an intimate acquaintance with the wants of the farmer and breeder. Whenever these can be affected by Legislation it is well to have a person in this important position who will do all in his power to see that they are not jeopardized. It is beyond question that in this respect there has been a great lack, and when important questions arose the farm was not properly "protected." This is apt to be the case when a majority of the legislators are from the other pursuits of life, the great trouble, however, being the want of harmony among the farmers themselves.

They virtually acknowledge inferiority by giving support to candidates who have no "affinity" with rural affairs in preference to one of their guild, and come to the false conclusion that a man who takes an active part in rural pursuits is unfitted for a lawmaker. This feeling is fast wearing away, and the business as it becomes broader is showing that men can pursue it and cultivate their mind as well. By broader, we mean that the business of cultivating the soil, breeding domestic animals and poultry, the care of orchards and vineyards is regarded very differently from what it was even so short time ago as a third of a century. Young men are educated carefully, their elders have educated themselves, and where one farmer made a study of the pursuit in the olden time there are hundreds of well-to-do farmers who are prone even at the present day to place their brightest sons in the store, counting-room or offices. If a collegiate education is given it is to prepare them for a profession, and the prevalent idea is that high mental culture for a farmer is out of place. No better proof that there is a change in this respect could be given than the results of the late election. With a farmer at the head of the State government, a miner for the second officer of the commonwealth, the speaker's chair filled by an active, ardent agriculturalist, for once in the history of California the people have conceded that there may be ability enough outside of the "learned professions."

We congratulate Mr. La Rue on his election, still more heartily our congratulations are offered to the people of California upon the selection of a man of his stamp, and above all that there is a man in the position to advance the interests with which this paper is so intimately connected.

HO! FOR AUSTRALIA.

On the next steamer for Australia, which will leave here Tuesday next, L. R. Martin will sail. His intention is to make quite an extended tour in that country, the main object being to see the blood stock of the Antipodes. We venture to state that Mr. Martin will be well pleased with the visit, and regret that we cannot accompany him. It may be that another year will afford the opportunity.

Mr. Martin has seen so much of the racehorses of the United States that he will be able to form a capital idea of the comparative merit of the horses of the two countries.

That he will be well received and his trip thoroughly enjoyable is guaranteed from the well-known hospitality of the turfmen of Australia, and it would be a waste of words to recommend that he be shown attentions that he is sure to receive.

A young trotting stallion, by Mohawk Chief, his dam by Venture, grandam by Easton's David Hill, a son of Vermont Black Hawk, is sent on the same steamer by his breeder, Jas. B. Chase. He is well bred, as Mohawk Chief is by Rysdyk's Hambletonian from a mare by Toronto. This colt has shown very well for the little training he has had, and is reported to have trotted a trial in 2:36.

EDITORIAL NOTES.

The Fresno Papers announce that the movement for the organization of a Fair Ground and Trotting Association has taken such form as insures for the enterprise a complete success. It is proposed to raise for this purpose a capital of $25,000. Through the efforts of Dr. Leach, $14,000 of this amount has already been secured, and the remainder can be obtained without any difficulty whatever. Negotiations have already been made for a quarter section of land adjoining the Barton Vineyard on the east, and it is proposed that the work shall be commenced without delay. The association proposes to make a race track that will be as perfect as any outlay of money can make it, and the pavilion and other buildings will be second to none in the state. It will offer accommodations here that will make this the winter resort and general headquarters for horsemen all over the state.

The San Joaquin Valley Agricultural Association, one of the most judiciously managed and prosperous societies on the Coast, has determined to build a suitable pavilion for its purposes. The proposition is to lease a public square from the city and erect a hall thereon. At a public meeting to consider the matter Mr. Shippee stated that the association was free from debt and had $4,000 or $5,000 in cash in its treasury. It had suffered for the past two or three years from the lack of a suitable hall for its exhibitions, and was determined now to build. It could raise $20,000 to put into a building. The idea meets with favor among the people of Stockton, and at present there seems no doubt that the pavilion will be erected at once and be ready for the next fair.

The Santa Clara Agricultural Society held its annual meeting on Thursday of last week. J. H. M. Townsend was re-elected president and T. S. Montgomery secretary. Directors were chosen as follows: For the one-year term, William Quinn; for the two-year term, Rush McComas; for the three-year term, John Trimble and George N. Rutherford. The secretary read his annual statement, showing the assets of the society, in addition to the grounds and personal property, to be $761 19; liabilities nothing. Grand stand fund: Assets, cash, $52; liabilities, outstanding notes, $6,300. A proposition to increase the fee for life memberships from $50 to $100 was not agreed to.

A Rifle Match of forty shots each between Louis Haake and H. J. Maugels of Company C., Second Regiment, takes place at Shell Mound Park Sunday, the 14th instant. As both are good shots, the same will no doubt be very interesting.

(Continued from Page 17.)

by Lexington. They had been kept together until their play became too rough for safety and they still carried the marks of warfare. Both were bays with quite a difference in shade, the lightest having three whits feet and white markings in his face.

This was Norfolk, and then so long ago as to be measured by within a few days of the fifth of a century, was the first time we saw the hero of our sketch. He was such a taking colt that Mr. H. wanted to buy him without further search, and reluctantly acceded to our request to wait until more were "looked over." We wanted a Lexington but were desirous that it should be the best obtainable. Our partner was wealthy and ready to pay any price, but we had to think more about the dollars. Never before or since could horses of a high class be bought so cheaply in Kentucky. John Harper only a few days before had paid Mr. Alexander $1,200 for Loadstone. The Knight of St George colt we got for $1,000, although her dam had cost Mr. Alexander $3,010, at a public sale two years before. Asteroid was rated at $1,000 and Norfolk $800. Asteroid being a grandson of old Blue Bonnet was held to be worth the $200 more on that account, as she had shown two great race horses in Lightning and Thunder, and the fact that "Old John" had paid so much for their brother at two years old was held to be absolute proof of the value of the blood. Little Arthur, too, was from the "Old Blue Hen," and he was a full brother to the dam of Asteroid. Nevertheless when expatiating on the probable excellence of the higher priced colt; Mr. Alexander informed us that Novice the dam of Norfolk was the fastest filly ever trained at Woodburn up to the time, and that an older brother, Norton, he considered one of the very fastest horses he ever seen race in Europe and America. He had sold him for a high price to a gentleman in New York, but an attack of distemper left him with "thick wind," and he took him back, or more properly he had not been delivered, and though he had only been kept at Woodburn to accommodate the purchaser, he preferred to return the money than have the buyer disappointed. It is needless to recount many of the incidents of that rather eventful trip and the most salient will do. The rest of the afternoon was taken up in looking at the stallions, broodmares and youngsters. At that time the lords of the stud were Lexington, imported Scythian and Ruric, and there were more than fifty thoroughbred mares. Many of them were celebrated at the time, many have acquired the highest celebrity since then. It would be almost like a rehearsal of the racing calendar for ten or fifteen years to tell over the names of the stars that first saw light on that famous place, and still it is doubtful if two of the same quality were ever reared there as the pair then in the paddocks on that March afternoon.

There was no more walking. Carriages with colored drivers, and colored boys to open the gates to facilitate progress. During the long evening there were plenty of racing reminiscences pleasantly recounted by our host, comparisons of the horses he had seen in England and in America, and Mr. Rarey contributed his quota of anecdotes and stories of English steeds. Mr. Alexander stated that he considered Lexington the best horse he ever saw, and had faith that his progeny would vindicate the theory and prove that his fame in the stud would be equal to his performance on the race course. He spoke of the large price he gave for him, and referring to a "Young Turfman's" criticisms said he felt the utmost confidence that he would yet sell one of his get for more money than he gave. With the desolation of war then so closely at hand, with a prospect that before it was settled the country would be torn in pieces, and with his best colts only valued at less than one-fifteenth of the sum he paid for the sire, it seemed like wild prophecy.

The morning saw us at the trotting quarters. Pilot Jr. and Alexander's Abdallah were doing duty, and among the colts were Almont and Belmont. From there to John Harper's, back to lunch, and then the route was to the "Big Spring." There were a drove of thoroughbred yearlings, and as they came sweeping along there was one a head and shoulders above all the rest. In stature we mean, for though he was a grand-looking colt, he was a little too much on the carriage-horse style to suit our fancy, and we noticed that one leg had a twist at the knee. Mr. Swigert was with us, and when the high-headed colt passed Mr. H——, "how much for him?" was the query. "Two hundred and fifty dollars," was the response. "I'll take him," was the rejoinder. "Hold on," we cautioned. "Look at that crooked foreleg." "I do not care for that; I am buying this fellow for myself, and you cannot have any interest in him" settled the dispute. This colt our friend named at the time Henry Ward Beecher; he was by Lexington from Belle Lewis by imported Glencoe. He was broken to harness, driven by Mr. H—— a short time in Iowa, afterwards sent to New York, and under the name of Luther ran some very fair races. He came to the Pacific coast, and the last we heard of him he was still alive and located in Oregon, so that three of the horses examined on that memorable trip found their way to the Pacific coast.

But this is a digression and to resume the story we went from Big Spring Farm to "Uncle Ned Blackburn's" only a few miles away. Mr. Rarey stopped at Spring Station expecting to take the afternoon train for Louisville. It is needless to relate to any one who ever had the pleasure of meeting Uncle Ned that we were very agreeably entertained. One of the most pleasant talkers on all pertaining to the horse, and as well posted as finest. The main purpose of our visit was to buy a Camden colt to replace old Blackbird who died the fall previous, but a son of Mr. Blackburn's was using him as a charger in the army. Still the evening was well advanced ere we could get away and it was quite dark when we returned to Woodburn. There was commotion and uproar. The darkies congregated about the dwelling, another carriage with a fresh pair of horses standing before the porch. The report was that the confederates were within six miles conscripting every man and "lifting" every horse they could find. Mr. Rarey said that the train would not stop and as it was loaded with soldiers and artillery it was thought that the Federals had evacuated Lexington.

Mr. Alexander was troubled more on account of his guests from the north than apprehensions for himself, and everything was in readiness for the party in Georgetown, and if found necessary to keep the carriage and driver and continue the journey to Cincinnati. Mr. H. thought no more of Lexington colts. He would have been glad to be back in Iowa, or, at least on the safe side of the Ohio. Mr. Rarey was still more anxious to place a larger gap between him and the boys in grey, and a gentleman from Detroit also signified his preference for an immediate start. At our urgent solicitation, however, they agreed to wait until a messenger could be sent to Midway, the nearest telegraph station and the reply was that the force was no nearer than Danville some thirty miles away. The team was sent to the stable with orders to start at the very earliest dawn. Supper eaten, and the evening passed under a state of sombreness almost amounting to despondency. Too dull for horse talk notwithstanding there were decanters of twenty-year "Old Crow," and the most engrossing topics was in cogitating whether the foe would make a night march or not.

There was the faintest streak of daylight in the east when the carriage whirled away from Woodburn, and had we desired the only chance of seeing the grand colts again before our departure would have been by the help of a stable lantern.

The second time we saw Norfolk was under very different circumstances. It was in the merry month of May in the following year, 1864. Leaving Chicago when the buds were only swelling on the trees, we found the country about St. Louis as verdant as the "emerant sea" that the Ettrick shepherd saw in his poetic vision. The trees were clothed in the fullest kind of leafy mantles, the lilac bushes were a mass of bluish-purple blossoms, and inside of the Abbey racecourse there was a crop of rye waving the bearded heads in the summer breeze. There was to be a grand race meeting. The steamboat men, stable keepers, hotels had contributed such sums that more money was "hung up" than ever before. The din of battle was remote and the greenbacks plenty. There was a grand collection of horses. The colts we had seen in the paddocks, scarred and scratched by sharp teeth and hard hoofs, fourteen months before were there. Well we remembered them as they cantered along in their morning exercise, although there was a hand added to the height of the golden colored bay, and he carried his white-marked face as if conscious of superiority, and the white feet were moved with the ease of the winged heels of Mercury. This was the son of Novice, and a more racing-like three-year-old never graced a track. His companion, Asteroid, while fully as symmetrical, had not the range or the freedom of motion of Norfolk, though we learned of a wonderful trial before leaving home, when in a run of two miles, a neck marked the difference between the two.

We do not intend to give a history of the races run by Norfolk, as these will be the basis of another article, in which his unsullied career, and the exploits of some of his colts will appear. There was a grand assemblage at this, his opening race, and grandly he earned the plaudits of cheers from thousands of voices. He ran away with his rider before the start, and even after this expenditure of energy, a field of the best colts were unable to make him "stretch his neck," or cause him to lower his head. He won in a "big gallop," and that was the most that a gallant and very nearly first-class colt like Tipperary could force him to do.

After this race we observed a gentleman eyeing him closely. We knew from the manner of his scrutiny that he was a judge of the form of a race horse. There was no fussiness. A change of position, in order to see him from different points of view, a rapid overhauling of the general conformation, and at the same time it was apparent that there was a rigid scrutiny. A companion was more demonstrative. He called attention to every point from nose to tail, from feet to withers and croup.

Fifteen thousand and one dollars was the price now put on the colt that had been offered for $800 so short a time before, and we must admit that we felt more despondent over the missing such an opportunity than when the forces of the Confederacy were so close in March, 1863. The bargain was quickly struck, and Mr. Alexander informed us that the purchaser was a Californian, and that he was destined for the Golden Coast.

At the same time he recalled the prophecy he had made, and remarked: "What do you think Mr. M. (The Young Turfman), will say now about my foolish payment of $15,000 for a blind stud?" He had some valuable engagements in the East, and his new owner, Mr. Theodore Winters, decided he should fill them before sending him to his home on the banks of El Putah.

How he again howled over Tipperary and left the cracks of the East as easily as he did the poorest in the race at St. Louis, and how he frightened the turfmen, or at least one of them, into perpetrating a great wrong will be told hereafter. As the playwrights say, "we will now suppose an interval of ten years."

In the golden autumn of 1874 there was a change of scene. There could scarcely be a greater antitheton than that presented from the bluegrass pastures of Kentucky in March, or the gorgeous view from the summit of the grand stand at the Abbey Park in May. It was a September day, but the air was hot, for there was a scorching wind from the North, and people were seeking shelter from the sunbeams under the balconies of the the stands, while above were throngs in light garments, and the waving of fans and wide-rimmed hats. Away to the East the mountains rose to a height which carried the snow-capped crests among the clouds, and there was a union of snow and vapor. Trees to the northwest marked the course of a river, stalls and a high fence enclosed a fair-ground, the most prominent object being a race track a mile in circuit, and for seven-eighths of the distance it was thronged with horses and cattle. At a signal a brass band struck up a lively march, and soon the head of the procession filed past the stand. After the lapse of so many years we did not require to be informed of the identity of the leader. There was the matured horse and yet so like the youngster in the paddock and the victor at St. Louis that we could not be mistaken. With all the increase of bulk, the volume of muscle, the rounding of the crest, the swelling of the barrel, there was the same stately carriage, the same elasticity of movement and the same defiant air. And thus, in September, 1874, on the grounds of the California State Agricultural Society at Sacramento, we saw Norfolk for the third time.

Between the first and the third what a change. In the interval marked by the visit, in the heat of war times, to Woodburn and now what vicissitudes, and correctly the prophecy of the breeder of Norfolk has proved. We have no time for retrospection, however, and must pass on to other meetings with the hero.

On a bright summer day some four or five years ago we visited El Arroyo. At that time A. J. Woods had charge of Mr. Winters' breeding department of that farm, and it is safe to say that Norfolk never looked better. Better than in the show condition when exhibited, for the coat was just as blooming, and the daily, and at times sharp exercise had absorbed a portion of the adipose tissue, and the muscles stood out fully and almost as hard as when training. The legs were without a puff and the eye as bright as of yore. Mr. Woods is a large man, 180 pounds, at least, and riding on a saddle which weigh twenty or thirty pounds. Norfolk carried him with as much apparent ease, as he ever did a jockey, and there was the same springy pasterns, the same jaunty air. A brace of greyhounds followed at the heels of the horse, and the course taken was towards a large field on the bank of the creek. It was not long before a hare was jumped and away went the dogs in hot pursuit. It was the biggest kind of a "jack rabbit," and fleet as was the pursuers, from a momentary loss of sight as the hare ran through a depression and a quick change to another direction a long lead was got.

Norfolk and his rider had been intensely watching the chase, the horse trembling with anxiety when it became evident that his part of the work had to be done and the instant the bridle rein was slackened he was off with a burst of speed that he could scarcely have excelled in the days of his youth.

The hare is turned, a short run beyond and the snap across the loin is his doom. There are three hares dangling to the cantle of the saddle when the hunting party return, and the old horse whinnies for the feed which he hears rattling in the sieve.

It is scarcely necessary to tell how Norfolk looked the last time we saw him the artist having been so successful in the "counterfeit presentiment," that words are superfluous. There is so little change from the time when he coursed over the fields at El Arroyo, that it is sufficient to say that there may be a trifle more sway in the back, and a few more grey hairs through his coat. His eye could not be brighter, and when he was led out of the box for the artist to sketch there was the vigor of a six-year-old.

It may be as well to state in this article that Norfolk is a very handsome shade of bay, and that he is so evenly balanced in form that there is a general harmony of proportion. In muscular development he is similar to his sire, though the gaskins and arms are a good deal fatter and the upper muscles more bulky. The muscles that clothe the stifle and haunch are very large, and even in high flesh show with great distinctness. His pasterns are long and have exactly the right set and the legs could scarcely be bettered. In whole let Norfolk be shown to good judges of horses, without giving a hint as to his identity, or performances, and he would be pronounced a horse which could not fail to do great deeds, something far beyond the ordinary.

Hereafter when the races of Norfolk are given there will be a history of those of his get. From the first year his colts appeared on the course until the present time there have been many of a high class, and, in our estimation, a number that will warrant being ranked as great.

It is almost superfluous to state that the full pedigree of Norfolk will be given, and some account of the family outside of his sons and daughters.

Answers to Correspondents.

G. F. F., Salt Lake:

Golduote was bred by Wm. M. Johnston (formerly of San Joaquin Co., Cal.), and is by Contraband, his dam by Jack Hayes, son of Winnebago, granddam by Leviathan, Contraband by Belmont, thoroughbred.

Editor Breeder and Sportsman: Would it interfere with a stallion in the season to work him, and trot a race on the 22d of February, and start the season on the 1st of March.
Red Bluff.

No, on the contrary in our opinion it would do him

RAISIN CULTURE.

Views of a Practical Raisin Man of Riverside—Expense and Profits.

The following paper on "Raisin Culture," by James Boyd of Riverside, was read before the last regular meeting of the State Horticultural Society:

In addressing you upon the above subject I will necessarily have to go over much ground familiar to many of you, but believing that raisin culture is but in its infancy, both as to our knowledge on the subject as to the practical details of the process of curing, etc., and as to the future magnitude of the business and its importance financially and socially, I have presented a few details from my own experience, hoping that the remarks may help to extend our knowledge of the subject, and aid those who are extending their hopes and purposes in that direction. When my attention was first directed to this industry ten years ago in Riverside (and my experiences have all been in Riverside, and from this standpoint alone can I speak) there was nothing distinctly known here, or indeed in California, about the business. We believed and hoped that our soil and climate were well adapted to raisin culture, and so we started in full of faith, but with no experience whatever. Information on the subject was not to be had, inasmuch as this department of horticulture was new to the English-speaking race. Since that time our information has been largely reinforced by the observations of Mr. West and others in the raisin districts of Spain, as well as the practical experience of Mr. Blower, Mr. Briggs and others in California.

The variety of grape mostly used for raisin making is the Muscat of Alexandria, although one or two sub-varieties, such as the Muscatel, Gordo Blanco and White Malaga, are by some thought to be superior, especially in the northern part of the State, but here in Riverside we have not been able to detect much difference, and we have known instances in which the resemblance was so close in the raisins that the grower had to mark them in order to know which was which. The fact would seem to be that in a soil and climate adapted to raisin culture, nature does her best, so much so that varieties which may be slightly inferior elsewhere are forced into such super excellence as to leave nothing more to be desired in quality. There is also another variety which is coming much into favor, called Sultana, which is a small white variety, seedless, quite distinct from the Muscat, said to be very prolific, but not coming into bearing as soon as the Muscat. It is mainly used for cooking, like the Zante currant. As it seems to be lacking in the fine flavor for which the Muscat is so valuable, it is probable that it will never entirely supersede the Muscat for cooking.

The best soil for raisins is the red granite soil of California, and the hot cloudless weather of the interior is best fitted to develop the rich saccharine properties of the grape and the fine aroma of the raisin. On the coast, where fogs are frequent, or on rich bottom soils, where the water is near the surface (say within six feet), the grape, although it may be large, is apt to be sour and watery, and to lack the fine appearance which only perpetual sunshine can give, and which can be best expressed by the Spanish word "Muscatel Gordo Blanco," which is applied to a variety of raisin grape in Spain, and which signifies rich, fat, white grape. Where there is not sufficient rainfall to produce a luxuriant growth of vine, the grapes, and consequently raisins, are apt to be what might be called lean.

In Riverside the rainfall is so light, and the atmosphere so dry in summer, that irrigation is an absolute necessity, and experience has amply proved that it pays to irrigate, in the increased yield, as well as the certainty of a crop in the driest seasons. The best practice in irrigating, judging from the results, is to irrigate before winter, or just after getting the fruit all out of the vineyard; then plow after the rainy season has commenced; then let it lie to get the benefit of the sun and rains, as late as possible in the spring or until the weeds and growth of the vines, which must be pruned before first plowing, warn you not to be too late with your work. We then give another thorough irrigation and plowing, and keep the cultivation going as long as practicable during the summer. This will keep them in good growth until the middle or end of July, when another irrigation will be sufficient to insure a bountiful crop. Irrigation has a tendency to retard the ripening of the grape somewhat, but as our winter rains are later in Southern California, and our sun is stronger than in the Northern part of the State, it is but a trifling drawback. About the beginning of September the grapes put on that rich golden amber, semi-transparent hue which indicates maturity, and about the 10th of September, in ordinary years, we expect to begin picking.

One essential of a good raisin is that your grape must be fully ripe. Unripe grapes will not make a raisin at all, and at the best are only poor dried grapes. In picking, the bunch is held by the stem, and all imperfect berries removed, care being taken that the bunches are not touched by the hand, as it destroys the bloom, and very much mars the appearance of the raisins. They are then laid on wooden trays, two feet by three feet, made of half inch lumber, planed on one side and nailed to cleats or end pieces two feet long by one and a half inches deep and one inch wide. The trays are usually filled with twenty pounds of grapes, which shrink two-thirds in drying, three trays containing twenty pounds of grapes making twenty pounds of raisins.

In September two or three weeks are usually sufficient to dry them. When about fully half dry they are turned, which is a very simple process and is usually done in the early part of the day by placing an inverted empty tray on top of a full one and turning both over at the same time, two men being requisite in the operation. The grapes are usually left in the vineyard during the drying process, although some have alleys through the vineyard for drying, while others carry them out entirely to clear ground, but neither process is necessary until later in the season when, if the weather is at all damp and the vines in full leaf, it is very advantageous to carry them out to some sunny spot, where, being canted slightly to the sun, they may have full benefits of the sunshine.

In the early days of raisin making we tried raisin drying on the ground, but we soon found that we would have to have some safer and speedier way. In turning by hand it was a very slow process, and you necessarily broke off more or less raisins off the stems, deteriorating their market value, and also making it a slow process picking up. Besides, if it should rain you had your raisins damaged by sand, etc.; and if the rain was at all prolonged, you ran the risk of losing the entire crop. Then paper was tried, with no advantage except cleanliness. Boards were also tried, which were found to be inconvenient and expensive. Then frames made of laths were tried, but were too cumbersome and inconvenient in gathering up the raisins. Finally trays were evolved, which seem to be the acme of perfection. The advantages of trays are economy in turning and in gathering into the sweat box, as you need to do is to pick up your tray and slip your handful of raisins into your box. Trays are also conducive to cleanliness, as also convenient in handling and moving, while, should it threaten rain, they can be easily stacked in piles on top of one another, and protected by empty trays.

When the raisins are fully dry they are put into large boxes called sweat boxes, a little larger than the trays, and 8 inches deep, holding 130 to 140 pounds. Although the boxes are called sweat boxes, the raisins do not really sweat. It is impossible to get the raisins uniformly dry, but by putting them in bulk in this way the moisture in the raisins gets diffused throughout the mass, and the stems, which previously were hard and brittle, get damp and pliable, are in a suitable condition for packing, and at the same time the rich aroma is developed, which greatly enhances the pleasure in eating them. After being in the sweat box a few days, they are in fine order for packing, which requires considerable skill in order to make them as attractive as possible. The best raisins are packed in layers of 5 pounds each, in boxes of 20 pounds weight, while extra choice are packed in halves, quarters and eighths, containing 10, 5 and 2½ pounds, respectively. Forms or molds are used to pack each layer separately and to press them, which is done generally in a screw or lever press (the latter preferred). They are then slipped into the boxes neatly wrapped in white paper, the top layer in each box being wrapped in fancy paper, accompanied with a lithograph of a vineyard or other suitable scene. The boxes are then nailed up and suitably stenciled preparatory to sending to market.

It may interest some to know something of the cost, as also the profits. Assuming that the land has been bought, starting with one-year-old vines, the total expenses for the first year would be per acre:

680 roots, 1 year old, 2 cents each	$13 50
Planting and care of same	30 00
Water for same	3 50
Staking and incidentals	10 00
Total	$57 10
Labor and water, second year	25 00

Returns after two years:

Third year, 50 boxes per acre, at $1 60	$ 80 00
Fourth year, 150 boxes	240 00
Fifth year, 200 boxes	320 00
Sixth year, 250 boxes	400 00
Total	1,040 00

Thus, in less than six years, the balance sheet, in ordinary circumstances, would stand:

First year's expenses	$ 57 10
Five years, $25 per acre	125 00
Trays, sweat boxes, etc	88 00
Expenses of picking, packing, etc	390 00
Total	$560 10
Sale of raisins, 5 years	$1,040 00
Total expenses, do	660 10
Net profit, six years	$ 379 90

I have put the cost of labor at the highest figure, while the price of raisins is perhaps lower than we have reason to expect, and I know of growers who have done much better than that; for instance, one grower sold 615 boxes from two acres in about thirty months from the time of planting, realizing a total of over $1,200, at a cost of not over $300. Another realized $600 from one acre, at a cost of $100 on an old vineyard; but these are perhaps rather more favorable instances than the average, and it is much better to figure under than over the mark. Then there are contingencies to be provided for. It may come an unusually rainy fall and early winter, and great loss may ensue. Each raisin maker who has anything over five acres ought to guard against emergencies by getting some kind of a drier. Ordinary driers are of no use, as raisins take so long a time to dry that the ordinary processes are not available. The Blower system promises the best, as he uses as far as possible the method employed in sun drying, by passing currents of heated air over the surface of the grapes, while the drier is so arranged that the ordinary tray can be used without any disturbance of the grapes, and the building for the drying can be extended indefinitely.

Raisins are unlike any other dried fruit, as a shower of rain does them comparatively little harm, provided it does not stay damp for eight or ten days after. They can also be half dried in our climate and put under cover for the winter and come out in the spring first-class raisins. The only thing to be dreaded is a heavy rain before they are half dry, with close, damp weather after for a few days, as they then begin to mildew and get quite useless. A good drier would be quite an assurance against such a contingency, and we would like to hear from those who have used the Blower system.

I had intended to go somewhat into the future of raisin-making, but perhaps that would be more in the line of those who handle them, and it will be time enough to consider the market question when we have fully supplied the United States; then it will be in order to consider the question of other markets.

Edward Hanlan and John A. Kennedy met at the office of the *Turf, Field and Farm* on Thursday afternoon of last week, and signed articles of agreement for a three-mile sculling race. Each man put up $1,000 as forfeit, and $1,000 additional must be posted with us on May 1, when the referee and place of race will be named. In case they disagree the stakeholder will appoint a referee. The final deposit of $500 must be lodged in our hands May 25. The race will be rowed about the first of June, and probably on water in New England. Kennedy, like Hanlan, is a long muscled man, and it is certain that he will push the champion in a race. In fact, Hanlan has repeatedly said that he would rather row any other man in America than John A. Kennedy. As the two oarsmen were in earnest, it was not difficult for them to come to an understanding. They disagreed on minor points, but each made concessions, and the articles were signed as printed elsewhere.—*Turf, Field and Farm.*

SALE OF MARS.—Mr. N. A. Randall of the *Western Sportsman* recently sold for F. Claypool of Indianapolis, Ind., to John Reher of Lancaster, O., the chestnut stallion Mars, foaled in June, 1879, bred by N. L. Sageser, on Jas. Miller's Sunnyside Stock Farm, Paris, Ky., got by Great Western, son of Mambrino Patchen and Miller's Favorite (2:34), by Alexander's Abdallah, out of Oriuo, by Miller's Hambletonian, full brother to Jim Monroe. Price $1,250.—*New York Spirit.*

The Ladies', Criterion, Flash, Nursery, Calumet and Northern Stakes for two-year-olds, the Illinois, Chicago, Green, Illinois Derby, Oaks and Dearborn for three-year-olds, and the Board of Trade Handicap, Summer Handicap, Merchants' Stakes, Garden City Cup and Champion Stakes for horses of all ages, to be run at the spring meeting at Chicago, close Jan. 15.

THE RIFLE.

Taking an Interest.

The shooting season among the riflemen has opened up earlier than usual this year. Matches are being made every week and several are proposed that will interest all sportsmen not only on this coast but also in the Eastern States. It has been talked of considerable among the members of the N. G. C. that a match would be desirable between a team composed of California military men and a team of New York or Massachusetts military men. It is understood by the riflemen on this coast the fancy scores made by the sharpshooters of the Eastern States are made with sporting barrels on military stocks with open sights or else with regular sporting rifles. If a contest could be arranged between the East and the West, our riflemen would prefer the Eastern brothers to shoot with the same kind of gun, and triggers to have a six-pound pull instead or hair triggers of three-pounds pull as nearly all the riflemen of the East have. Teams of four to twenty men on a side, with 100 shots over 200 and 500-yard ranges, the same rules and regulations to govern both teams, would make an interesting match. It is true the rifle season will not open in the East before May or at least till the weather is settled, but it is well to talk over the subject and get an interest taken in the matter before the time of the opening. In a friendly competition of this kind the expense would be very small; only the cost of ammunition and telegraphing the scores would be necessary. We hope to see a match of this kind arranged and shot as soon as convenient because it would place the Eastern and Western riflemen on a better footing and understanding with each other.

The Linville—Brown Match.

Last Sunday the match between the two above named contestants came off at Shell Mound Park. The terms of the match were 50 shots each at 200 yards with any military rifle, for the sum of $50 a side. Mr. Brown used the Sharp's rifle and Mr. Linville the Springfield. The shooting did not begin till nearly 2 o'clock. The atmosphere was quite clear and the light good. The wind, though strong and cold, was steady. Mr. Brown led off and made a four for his first sighting shot, but did not make use of the privilege of his second. Linville warmed his Springfield with both sighting shots and made a three and four. The principal feature of the shooting was the closeness with which they kept together. At the second and third rounds of ten shots they were even; at the fourth and fifth Brown was one point ahead, winning by only one point. Probably another match between these two gentlemen will take place before long. Following are the scores:

Geo. H. Brown	4	0	4	4	4	5	5	5	5	4	4—44
			4	4	3	4	4	4	3	4	4 5—39
			4	5	4	4	5	4	4	4	3 4—41
			4	5	5	4	4	4	4	3	4 4—41
			5	4	4	4	4	4	4	5	4—43
Total											207
P. D. Linville	3	4	3	5	5	4	4	4	4	4	5 4—42
			5	4	4	4	4	5	4	4	4 3—41
			4	4	4	5	4	5	3	4	4 4—41
			4	5	4	4	4	4	4	3	4 4—40
			4	4	4	4	4	5	4	5	4 4—43
Total											206

Sergt. C. Nash and S. I. Kellogg acted as judges and M. J. White as scorer.

Kuhls and Haake.

A little match for a purse of $10 was shot on Christmas at Shell Mound Park with military rifles at 200 yards. We call attention to the pretty string of ten consecutive bullseyes made by Mr. Kuhls. Following are the scores:

F. Kuhls			4	4	5	5	5	5	5	5	5—48
			5	5	4	4	5	4	5	4	5 5—45
Total											94
L. Haake			3	4	5	4	5	4	5	5	4 5—44
			4	4	5	5	5	4	5	5	5 5—47
Total											91

Arrangements have been made to have another rifle match among some of our most enthusiastic riflemen. This shooting will come off two weeks from to-morrow, Jan. 21st. The match is for a purse of $80, with four competitors, namely: Officer P. D. Linville, Geo. H. Brown, P. H. McElhinny and Mr. S. P. Rowle. The distance is 200 yards, the best man taking the money.

☞An exchange says: "Tombstone has a rifle club that challenges the Territory for money or marbles, and to shoot at a target, turkeys or pigeons." We would suggest that if the boys in the Territory can't find any "foes worthy of their steel" they can have all the fun they wish by sending a challenge to some of our California clubs.

We understand that there will be a rifle match in the near future between Mr. Ed Taylor and Mr. L. R. Townsend. The distances will be 200 and 500 yards. A purse of $10 a side will be made up. The shooting will probably take place at Shell Mound park.

THE BEEF BUSINESS.—Probably more men have made fortunes in Montana at the cattle business from a small beginning than in any other Territory or State. Take, for instance, the following item from a Cincinnati paper. It refers to a ranchman who had been years in Montana. He worked as a cowboy until he had saved something from his earnings and began the purchase of stock. Two or three years later he took in a partner with $4,000, and invested this sum in stock. They now have about 12,000 head of sheep and 4,000 head of cattle, and occupy a 15,000-acre ranch in the Gallatin valley. Herders are paid $40 per month. Cattle are marketed at two years old, and estimated to cost $4 a head for herding, or $2 a year. This party is delivering a large quantity of wool for shipment to Boston. He came to Montana from Maine, and his partner from Boston.

THE GUN.

A High-Toned Club.

"Are you fond of duck-shooting?" asked a friend, the other day.

"I am, under certain and favorable conditions," was my reply. "To rig one's self in hunting costume—flannel shirt, corduroy trousers, cotton overalls and jacket, and indiarubber long boots—stop at an awful country tavern, get up in the dark of a dreadful morning, walk miles away to a dismal marsh, plunge into it waist deep, trudge all day in wet and hunger, to come in at night weary, starved, drenched, profane, covered with tule mud, and in one's bag two sprigtails and a pair of mud-hens—no, I do not like it. I do not relish the return in soiled garments by rail and the Oakland ferry, compelled to lie about my game till I reach Washington Market, and fill up with canvasbacks at a dollar apiece; compelled to send canvasbacks to those I have promised, and send sprig-tails and widgeon, broad-bills and gray-backs, to those who do not know the difference. This sort of thing is no louger amnsing. It has lost its romance. I am just turned of the age when the lies I am permitted to tell justify the hardships I am compelled to endure. I like a snipe-hunt, when the indulgeuce of a generous companion permits me to sit on the fence aud see him shoot, and upon coming in at night to claim half the glory and receive half the birds, and upon returning home be permitted to narrate an uncontradicted account of my own exploits."

This sort of huntiug is very comfortable and satisactory, but the swell thing to accomplish is to become the guest of the Teal Shooting Club; location, the Suisun marsh, beyond Benicia. To become a member of the Teal Shooting Club is to attain the apotheosis of duck-hunting; to become a guest of the Teal Shooting Club is to be temporarily apotheosized into the heaven of perfect duck-shooting. You get upon the overland train at half-past three; you hand the haggage-master your gun-case, and you hand him half a dollar; you take a seat in a silver palace car, presenting the colored gentleman half a dollar. The railroad company, as a favor conceded to the Teal Shooting Club, has given them a station, stops its trains for their accommodation, and provides them with fresh water. You step from the train to the elegantly appointed gondola of the Teals, and are rowed by moonlight to its village of barges; one eqnipped with kitchen, store-closet and dining-room, hung with chromos by the old masters; another divided into eight private bed-rooms, with wash-stands, water-closets, easy beds and lockers, clothes pegs and gun racks. Another barge is fitted for servants, and has a guest room of ample dimensions. James, the cook, is an artist. The dinner is sumptuous, the breakfast is appetizing, the lunch is a poem. The guest is provided with all equipments, from flanuel overshirt to gnm boots—everything but gun and cartridges. Summoned at early dawn to early coffee, given a setvant and a row-boat, in a comfortable overcoat, on cushioned seat, gun in hand, you are rowed to the "pond." From the slough to the pond canals are cut, through which the boats are pulled. You are placed in the "blind" on a cusbioned seat, the decoys are placed, and your servant hides in the tule, and waits during the day to pick up your birds. At noon James sends you a pair of dinner pails, one containing a hot meal; the other, dessert; a bottle of Roederer and a couple of cigars accompany it.

The Teal Shooting Club is the best appointed duck club in America, and the Suisun marsh the best duck preserve of which I have any knowledge. It comprises four thousand acres, upon which this club has expended something more than ten thousand dollars to put it in comfortable condition.

At night of the first day I had twenty birds, six of which were canvasbacks and five white geese, which I had shot in utter defiance of the society for punishing cruelty to animals, simply for the fnn of seeing them fall from their dizzy height. The second day I bagged thirty-seven ducks and three geese. From my pond I was rowed home to a sumptuous dinner—on this occasion a canvasback roast, with accompaniments.

The members of the Teal Club are: G. Frank Smith, Pesident; W. W. Traylor, W. F. Whittier, W. P. Fuller, R. S. Floyd, John Taylor, A. C. Titcomb and William Hopkins.

The score of the season is as follows: Traylor, 516; Smith, 431; Whittier, 387, Fuller, 294; Taylor, 182; Titcomb, 110; Floyd, 13; Hopkins, absent; guests, 571. Total for the season, 2,484.

There is only one thing in the duck-shooting world more desirable than to be a member of the Teal Shooting Club, and that is to become its guest. When one has been invited to shoot over its preserves, there is only one thing more to be desired, and that is to be invited again. It is with this end in view that I give the clnb this most excellent notice, and declare my irreconcilable hostility to poaching pot-fillers who encroach npon the hired preserves of hunting gentlemen.—*Argonaut.*

With Two Barrels.—The other day a couple of old hunters were having a little chat abont big shots. One of the men who had beeu here since 1853 began to tell how many ducks he had killed with two barrels. The other hunter—Jim Payne by the way—laid over him a little in nnmbers so he gave np the dnck yarn and began to talk about geese. Bnt Payne was ahead of him even on having killed 196 geese in early days with two barrels. Tbe old timer thought he would switch off on to snipe, but when he was told that Payne had bagged with two barrels 700 snipe, and didn't pick up the wounded ones, he got into his duck boat and silently sculled away. There is nothing like a chat amoug old hunters to kill brids. It always beats powder and shot.

Opening up.—No doubt owing to the fact that hunting natural wild game is such poor sport this year, the hoys have opened the pigeon shooting season earlier this year than usual. Tbere has been one pigeon match shot this year and the prospect of several more in the near fntnre. A match at fifty clay pigeons comes off to-day at Adams Point, Oakland, between Mr. N. Williams and Al Havens, for $20 a side. As many are not familiar with the location of Adams Point it might be well to stato here that it is that point of land that lies on the Brooklyn side of Lake Merritt nearly opposite Twelfth street, Oakland. Boats can be procured to ferry anyone across if they do not want to tramp aronnd the lake.

At Huffaker's ranch, Truckee meadows, they had a pigeon shooting match on Christmas. Crack shots came from all quarters to participate. After they had got started in on their work, Huffaker turned loose his Indian "Jim," who "scalped" all the champions, knocking the pigeons right and left as suddenly as if they had been struck by lightning. Jim proved a regular aboriginal Dr. Carver.—*Virginia Enterprise.*

Grouse Shooting in Montana.

A writer uisng the nom de plume of Doremus contributes tbe following description of a day's grouse shooting in Montana to one of our Western exchanges:

The whistle of the first locomotive will in a few months awake the echoes of Helena's surrounding hills, announcing, I hope, the advent of many a true-hearted sportsman of the East. Montana will, I think, afford a retreat, where for a brief period the noise and tumult of the city may be forgotten. Twenty miles from Helena, in almost any direction, one can find true nature undisturbed, except by her own melodious sounds.

Aug. 14, 1881, found a frieud and myself twenty miles due east from Helena, waiting for the morning of the fifteenth, on which day the open season commenced. The evening was spent in recalling old reminiscences, and on the probabilities of the next day's sport. A three-mile walk the next morning brought us to the home of the grouse; the staunch pointer of my friend told us that birds were near, and soon we saw them running through the bunch grass. The startling whirr of two pairs of wings announced the signal of battle; it took three barrels to get them, as at the first shot both of us unintentionally fired at the same bird. Another cartridge slipped in, and up go two more, they sharing a similar fate. The remaining one of the flock escaped for a time, as he did not rise until out of range. Anotber half-mile over unfavorable ground, another point, and the crash of four barrels added to our string.

The Montana sportsman does not usually encumber himself with a game bag. He merely provides himself with several buckskin strings, and makes the nearest tree his game bag, or if he cannot return by the way he came, he carries them in his hand, and can therefore get rid of his burden at a moment's notice, instead of having a dead weight dragging on his shoulder, or being encumbered with a coat resembling an inflated balloon, which is the case if he has the all-pocket and no-coat style. You need never fear that anyone will steal your birds; the only enemies are an occasional hawk, and that fleeting shadow, the coyote, and he in only a few places, for this pest is seldom found except in the open country.

We were now in the heart of the mountains, birds were plenty and not too wild, which gave us the opportunity of spending a very pleasant hour. The wants of the inner man began to be felt, but his demands had to be overlooked, as the wherewithal to satisfy him was wanting.

By 2 p. m. we concluded that all the birds we cared to carry had been killed, so the homeward march began. Coming quickly aronnd the point of a clump of quaking aspens, a sudden whirr startled me. As I was dreaming of the black-tailed deer, and wondering if this would not be a good place later on in the fall, my trepidation caused the loss of the shot, but nevertheless all the birds did not go "scot free." O. was on the alert, and, like Oliver, ready "for more." When the last string of grouse was reached, the count and equal division of the load made, we found that twenty-two birds had been killed, and whose weight increased in a geometrical ratio as we approached camp. Four feathered beauties, minus both feathers and hide, were soon in the pot, and in the short space of one hour naught was to be seen save remnants, which also met their fate, for they were the supper of our four-footed friend.

To the coming brother of the East, I would add: Do not expect too much, and I think I can safely say you will find four things—pleasant days, fair sport, a ravenous appetite which knows no bounds, and a hearty welcome from the rugged old pioneer who will never ask at first sight: "Who are you?" "Where do you come from?" 'Twill simply be: "Stranger, come in."

The Rabbit Plague in Australia.

The ancient saying that the race is not always to the swift nor the battle to the strong is receiving a new illustration in Australia. Of all animals the timid rabbit would seem to be the last that would ever wage a war of extermination against man; and yet that is precisely what it is doing in Australia. One colony has already lost 2,000,000 sheep by them; the plague is spreading northward at the rate of 100 miles or more a year; and the *Federal Australian* says that the rabbit invasion threatens the great industry of the colony with ruin.

"The impossibility of feeding large flocks of sheep and innmerable rabbits at the same time on the same breadth of pasturage, is just as great as would be that of growing wheat and hay on the same soil. There is only one alternative in this case: Either the flock owners must expel the rabbits or the rabbits will expel the flock owners." The conviction is that the evil has attained a magnitude which puts it beyond the hope of control by local efforts, or even by any one colony. The movement for the extermination of the rabbits must be simultaneous and nuiversal to be of any avail.

The proposition now is for a general act of the colonial assemblies levying a tax on all lands, whether stocked or not, to meet the cost of a general war upon all invaders by the colonial governments. It is proposed that each colony shall appoint a staff of rabbit inspectors to enforce repressive legislation, each colony undertaking to keep its own borders free from the plague.

"The flock owners over the entire area of the continent," says the *Australian*, "must make common cause in the endeavor to exterminate the plague, and to that end must aid their respective governments by every means in their power. War to the knife must be declared by every individual interested in station property in Australia against a pestilence which positively threatens nothing less than the gradual destruction of the wealthiest interest that has yet grown into flourishing existence in this part of the world."

Having declared general war upon the rabbits, the great question would appear to be the devising of modes of attack that will be at once efficient and economical. One flock-owner is mentioned as having trapped 5,000 of the little pests in a space of four months; others have tried general poisoning, and yet no perceptible check has been put upon the rapid multiplication of the prolific and all-devouring vermin. Shooting the rabbits is out of the question, there are so many of them, their wariness and burrowing habits adding to the hopelessness of meeting the invasion by individual destruction. They must be killed by the million, and at a cost that will not exceed the value of the land reclaimed from their ravages.

Probably the most welcome guest in Australia to-day, says the *Scientific American*, would be the inventor of a solution for this pressing and all-important problem. The money values at stake are enormous; and the successful inventor of a cure for the evil, which so gravely threatens the prosperity and future progress of the Australian colonies, would doubtless make as good a thing for himself as his invention would be for the sheep raisers.

The Dixon *Tribune* complains of the scarcity of game.

The First of the Year.

The first pigeon match of 1883 came off last Sunday at Bird's point, Alameda. The principals of this shooting were Mr. O. K. Hopkins and Mr. Jas. Scott. The match was shot under the Hurlingham rules, which allow the use of two barrels in a thirty-yard rise. N. Williams acted as judge for Mr. Hopkins and F. S. Butler for Mr. Scott; Al Havens acted as referee. Harry Bird officiated as trapper. Following are the scores:

											Total.
Jas. Scott	1	1	1*	1	1	1	1	0	1	0	1—10
O. K. Hopkins	1	1	1	1	0	1*	0‡	0	1	1	1— 9

* Both barrels used. ‡ Bad cartridges.

On Mr. Hopkins' eighth and ninth birds, the cartridges missed fire and he did not think to use his second barrel. One thing that made this match interesting was the fact that it was for money. A purse of $40, or $20 a side, made the gentlemen do their best shooting.

Duck Traps.

The farmers of Butte county are exercising their ingenuity in constructing traps for the wholesale destruction of geese and ducks. The latest contrivance is described by the Gridley *Herald:*

The wild ducks are more destructive this winter than are the geese. At least that is the complaint of the ranchers. While the geese feed more or less during the day, the ducks confine their depredations to the night when the darkness prevents the herders from successfully warring against them. Charles Chapman has been greatly annoyed by ducks and his grain has suffered to a considerable extent. But Charlie has hit upon an expedient that is not only protecting his grain but threatens to annihilate the duck family. He stretched five strands of barbed fence wire from the top of his barn to a post twenty-five feet high, placing the wires about eight inches apart. A hair-trigger shotgun, loaded, was fastened to one side of the post, at the top, the muzzles pointing along the wires. From one of the latter a small wire ran to the trigger of the gun. This trap was set Thursday night of last week. The wires were only thirty-four feet in length. About two o'clock Friday morning Charlie was awakened by the discharge of the gun. Then followed a chorus of quacks. He went ont. On the ground in the vicinity of the wires he found twenty-three ducks—nineteen were dead, the remainder crippled so that they couldn't fly. Ten of the lot had been struck by the shot from the gun. The remainder had flown against the wires, the shock killing them. He reloaded the gun and put up one of the wires which had been loosened from the pole. Between three and four o'clock the same morning, he was again woke up, but didn't go out. When he arose in the morning he picked up thirty-seven dead ducks, making a total of sixty killed during the night. He was in town Friday and told us that he intended erecting at least five hundred yards of the trap on his grain field. The experiment was suggested to him by recollections of the manner in which prairie chickens killed themselves by flying against the telegraph wires "back East."

The question is asked what law is in force in Tuolumne county in relation to the killing of deer. The answer is, that the Supervisors of this county exercised the authority given them in the game law and fixed the time when deer may be lawfully killed, from the first day of September to the first day of Jannary, in each year. By the time these one-horse officials get through doctoring the deer laws, the game itself will be all killed or run off. The game laws passed by the Legislature are good enough as they stand if they were only enforced by these same law tinkers, but the continued changing of the laws only gives the "skin hunters" a better chance of following up the game in one place after another as the "local" season changes.

The Liuville-Brazell shotgun-rifle-pistol match comes off to-morrow at Shell Monnd Park. For the sake of convenience the pigeon shooting part of the match will be shot close to the Trotting Park. This will be an interesting match and a great many will attend. The sharpshooters will go over on the 11 a. m. boat.

The Cordelia Shooting Club will not nse their shooting ground on the marsh at Cordelia creek after this week, but Captain Crittenden, of the Lolita, will stay there with the yacht, and, we understand, will furnish accommodation for hunting parties for the rest of the seasou.

A great many ducks were seen out on the mud flats at San Pablo, but they would not fly or come in where the hunters, who went up Sunday for a little sport, could get a shot at them. The hunters only made a remark with an interjection point after it, and returned home.

Mr. Precht was at Alvarado last Sunday and bagged sixteen English slipe. He also killed a beautiful "golden plover," a bird rarely or never seen in this vicinity before. Mr. P. is having this rare bird preserved by the naturalist, Mr. Lorquin, on Kearney street.

An exchange says that the Vacaville Gun Club is just spoiling for a match. There are plenty of gun clubs throughout the country and it is a pity for an enthusiastic club to spoil for a little salting. Can't the Sportsman's Club give them a little rub?

The new club which has obtained shooting preserves in Suisun marsh has the ground at Thickbrooms place south of Cordelia drawbridge and between that and Goodyears creek.

Mr. Robt. Liddle was at Belmont last Sunday and bagged thirty-eight ducks. He says that there has been very good hunting during the last two weeks down in that vicinity.

There is considerable game in our markets this week, of which there are a great many canvasbacks. They come in principally from the Sacramento river and Merced.

Reports from Bethany say that the snowstorm drove the ducks away from the lakes in that vicinity, but with the fair weather they are returning in large numbers.

The lack of rain or some other reason has made the ducks pretty scarce nearly everywhere this season.

Ducks are plentiful but there is a scarcity of quail about Sacramento.

A. F. Adams bagged ten ducks on the Alameda marshes last Sunday.

Mr. R. N. Brooks is still very sick with the malarial fever.

Stockton Gun Club's Pigeon Shoot.

January 4tb there was a little shoot-match at the grounds of the Stockton Gun Club below the city. Some of the participants tried tbeir guns before tbe match and C. J. Haas brought down five straight birde. Then F. C. Post and E. Leffler tried a pair and four single birds with the followiug result:

Post	1	1	0	1	1	1	1–5		
Leffler	1	0	0	1	1	0–3			

Tbe two then tried two pairs and four single birds as follows:

Leffler	1	1	1	0	1	1	1	1–7	
Post	1	1	1	1	1	0	1	1–7	

The main match was at ten birds each, twenty-one yards rise and no bounds, each participant being allowed two minutes in which to retrieve his bird; entrance $5. It resulted as follows:

C. J. Haas	1	1	1	0	1	1	1	1	0	1–8
C. Rich	1	1	1	1	1	1	1	0	1	1–9
F. D. Leffler	0	1	1	1	1	1	1	0	w	
J. Dunham	1	1	0	0	1	1	0	1	1	1–7
B. M. Hohenshell	0	1	0	1	1	1	1	0	w	
J. Swain	1	1	0	0	0	w				
O. Marshall	1	1	1	1	0	1	1	0	1	0–7
F. N. Lastreto	1	1	1	1	1	0	1	1	1	1–9
F. J. Post	0	1	1	0	1	1	1	1	1	0–7
A. E. Meyer	1	1	0	1	1	0	1	1	1	1–8
E. Leffler	0	1	1	1	1	1	1	1	1	0–8
F. White	0	1	0	1	0	w				
W. Aaron	1	1	0	1	0	1	0	0	1	1–6
J. B. Burnett	1	1	1	1	1	0	1	1	1	0–8
S. N. Cross	1	1	0	1	1	1	1	1	0	0–6

Rich and Lastreto divided first and second moneys, each taking $22 50. Haas, Meyer, E. Leffler and Burnett divided the balance, each getting $7 50.

Several members of the Teal Station Club are going to their preserves this week and next. This trip will probably he their last hunting trip this season. There is very poor pond hunting though in the sloughs tbere are a great many canvasbacks and some mallards, but it requires considerable muscle to scull a skiff around all day in order to make a good bag.

Tbe best part of the duck shooting season has now gone hy and the shooters are looking forward to some good snipe sbooting as the next available sport.

A good many flocks of canvasback ducks are seen in the lower bays of late and on tbe Oakland side tbey seem to he quite plentiful from all accounts.

Foreign Sporting Notes.

Palmbearer, who ran second to Sir Bevys for the Derby of 1879, has been sold to go to New Zealand.

The English *Racing Calendar* of December 14th contains the following notice to clerks of courses and managers of race meetings: "With a view to obviate the nnnecessary clashing and undue mnltiplication of race meetings the stewards of the Jockey Club will in future, before allowing any fixture to be advertised in tbe *Racing Calendar*, require notice to be eent to Messrs. Weatherby, in order that the stewards may be able to decide what meetings it may be desirable to sanction in the interest of racing:"

Trickett, the Australian sculler, has been started in business by some friends as proprietor of tbe "Silver Grid," in Sydney, N. S. W.

Tbe stewards of the Jockey Club, having communicated with Lord Ellesmere on the subject of the application by His Lordship'e private trainer, C. Archer, for a renewal of his license to train on Newmarket Heath, and having received satisfactory assurances from Lord Ellesmere as to C. Archer's future conduct, have decided to grant him a license for next year.

A very important question is at present being discussed by tbe committee of tbe French Jockey Club. Certain recent occurrences have suggested in this quarter the advisability of extending the license system from jockeys to traincrs. Tbe measure has, of course, its opponents. Such was the case wben the yoke was first applied to the professional riders. Witb tbem tbe plan has answered well, and it appears probable that the licensing of trainers would give as satisfactory results. At any rate, tbe success of tbe system in England is an encouraging precedent and certainly no one will deny that it gives the autborities of the turf a power of which they eometimes stand in need.

A fancy bet of £500 was laid on the Derby at one of the London clubs last month, the backer taking Macheath, Prince, Keir, Beau Brummel, Fulmer, Ladislas and Energy against the field.

With reference to tbe suggestion of General Pearson at the meeting of the Jockey Cluh, beld on Novembnr 27, the stewards bave decided not to lengtben the existing T. Y. C. courses, hut to form a new six-furlong course on the flat, finishing at tbe T. Y. C. winning post, tbis course to be called tbe "Peel Course," aud a new six-furloug course on tbe B. M., finishing at tbe T. Y. C. winning post; this course to be called the "Exeter Course."

William Cook and William Mitcbell, the English hilliard players, bave signed articles to play a match of 3,000 up, level, for £1,000. The dates bave not yet heen fixed.

A public meeting was beld at Fishmongers' Hall, London, on December 21, for the purpose of establisbing a Natioual Fiah Cultnre Association of Great Britain and Ireland. Mr. Birbeck, M. P., president of the Norfolk and Suffolk Acclimatizatiou Society, presided. Tbe chairman said English waters wauted more protection tban was at present bestowed upon them, and he tbought tbe question of fisb culture was one deserving every attention and support. Much had been done by private enterprise, but tbe estahlisbment of tbe National Fisb Culture Association was highly desirable. A committee was appointed to carry out tbe proposed object, witb tbe Marquis of Exeter as president.

Frederick Arcber was the recipient of a bandsome and costly servicc of silver plate given by a number of his friends in anticipation of his approacbing marriage witb Miss Dawaon. The presentation took place at a dinner given at tbe Westminster Palace Hotel, London, on Decemher 18. Lord Hastings has also presented Archer witb a prize bullock, exhihited at the recent Islington cattle abow, which will be roasted wbole on Newmarket heath on the evening of the wedding, which is to take place during the last week in January.

Rifle at Alameda.—Last Sunday the California Schuetzen Club b[illegible]d their first monthly shooting of the season. The shooting was done on the ring targets. The followiug are the names of winners and tbeir medals and number of rings: Chas. Gohlet, A. Sprecker, 436 rings; first-class medal, H. C. Smith, 374 rings; second-clase medal, F. Boeckmann, [illegible] rings; third-clasa medal, C. W. Lingenfelsen, 366 rings; [illegible]-class medal, A. Hagedorn, 286 ringe.

CORRESPONDENCE.

New York Letter.

New York, Jan. 3, 1883.

Editor Breeder and Sportsman: Since my last letter the Christmas holiday season, those happy, joyous days so dear to all enlightened bearts in every portion of our civilized globe, have come and gone, and as tbey have engrossed the universal attention of all classes, tbe young and the old, the wealthy and the poor, the famous and those lesser lights yet unknown to fame, there is comparatively little of moment for your correspondent to chronicle, especially in the line of outdoor sports. The holidays this year have been lacking in one distinctive feature, however, almost inseparable seemingly from the ideal Christmas of our latitudes, namely the presence of snow, and the promise of the present winter, which opened with fine sleighing on Thanksgiving Day, has not since been fulfilled, all the weatber bureau prophets to the coutrary notwithstanding. The city is full of the disconsolate purcbasers of tbe immense etocks of fancy sleighe unloaded by fortunate dealers dnring the two weeks succeeding the heavy suowfall which ushered in December, and the majority of these unhappy buyers have become misanthropes hy this time. The wires told us yesterday tbe unprecedented experience of San Francisco New Year callers, and the indiscriminate snowballing which many merry ones indulged in to their sorrow and the swelling of the police revenues. Suow is indeed a great rarity in tbe Golden City, and a fall of such long duration as Monday'e something to be long remembered by San Franciscans.

Despite the sluggishness in sporting circles in these parts, from the Sunny South the note of preparation is sounding and the commencement of the winter carnival at New Orleans, which it had been expected would now he in the act, has had to be deferred until the 20th. By that date fully one hundred and fifty horses will be at the Crescent City, over half that number having arrived at last advices, and those now on the way from all parts of the South and Southwest will double that number, as stated. Col. McDaniel is again in the field with a stable of ten, and he has three real good ones. The four-year-old colt Monarch, who defeated the fastest lot of horses that faced the starter at Saratoga this summer three-quarters of a mile in 1:14, and afterwards won a majority of tbe fall stakes at Louisville and the Dixie stakes at Baltimore, is one that will be hard to beat at his distance. And the two three-year-olds, Lord Raglan and Ada Ban, were nailers last fall, both finishing the season strong, which in a two-year-old is a much better quality as a promise of excellence the ensuing season than to commence well in the spring and finish up badly. However, this rule eometimes works inversely, as in the case of Hindoo, and others that might be named, although in the case of the great son of Vigil there were good reasons for his retrogression in tbe summer and fall of 1880. The McDaniel confederacy nsed to be a terror to other racing stables in the old days, and as the old Colonel seems to have taken with his young wife a new lease of life, he may make it hot for the boys yet!

In view of the great increase in racing, as shown by the new aud old associations throughout the country, the suhject was broacbed some time ago, and is now again revived, regarding the project of a National Jockey Cluh. There wonld be no lack of occupation for such a Board of Review in the settlement of the many vexing questions that arise during the racing season, and tbe adjustment of these and the other multitudinous matters that would engage their attention necessarily would be of much benefit to the racing public generally.

During the last week Lewis Clark of Louisville has been here lookiug up the interests of his association in the matter of its valuable stakes, which closed yesterday, and he has personally presented this subject to the "governors" of the Coney Island, American, Monmouth and Saratoga racing associations, who have, it is said, resolved to move in the matter at an early day. Tbe great sale of the stud of the late Mr. Gretton that took place in England yesterday showed that Isonomy, the famous son of Sterling and Isola Bella, was to be retaiued in the place of his nativity, W. S. Crawfnrd becoming his owner for the sum of $45,000, the other thirty-three horses down to be sold bringing, if tbey were all brought to the hammer, very little more in the aggregate tbat the sum realized for Parole's old antagonist. Many had thougbt that this celebrated racehorse would be hought for America but it seems to have been otherwise decreed by the powers tbat be. Isonomy's Manchester Cup and Foxhall's Cambridgeshire will long remain at the "top of tbe tree" wherever the racer is known or appreciated, and in looking at the two unprecedented performances it is hard to say which was the greatest in point of merit. Isonomy, a five-year-old, beats a field of tweuty-four horses over a mile and three-quarters of ground, with the weight of one hundred and thirty-eight pounds up. Foxhall, a three-year-old, carrying the crusher, for his age, of nine stone (one hundred and twenty-six pounds) vanquishes thirty-two of tbe fastest horses of England and France, over nine furlongs. Of the two, one leans perhaps a trifle toward the performance of the younger horse, for it seems to be generally accepted as an sxiom tbat weight tells more in a long race than in a short one, though of course in a question of this sort otber tbings have to be takeu into consideration, such as the condition of the goiug, the severity of tbe pace, etc., etc.

Tbat Foxhall went wrong this season is greatly to be deplored, although any horse that ran such a desperate race as he did in the Ascot Cup whicb he won, aud then without a rest was asked to run three miles against Fiddler the next day, which of course be failed to do successfully, would be apt to get "off." It would be strange if he did not. Had the great winner then heeu indulged with a let-up all might have been well, hut Goodwood was near and he was hurried along until perforce they had to atop. That this has had more to do with Foxhall's temporary retirement from the turf than the reported contracted feet caused hy inferior attention in tbe training stahle is patent to every unprejudiced mind, and Mr. William Day hae the sympathy of all in what looks to he a case of great injustice to him after what he had accomplished with the Keene stables.

Raciug statistics are ahout all there is of interest juat now in our metropolitan sporting weeklies. That 1882 wae by long odds the greatest year tbe American turf has ever seen goes without saying, and I will not attempt to burden your columns with figures and such like. A hrief mention, however, is due to the great showing made by the two meetings of the Monmouth Park Association. Less than twenty days' racing, and giving in that time in purses and stakes nearly $140,000. Shall any one attempt to belittle tbe industry of the turf after such an exhibit as this?

Walton, the plunger, having learned all this prosperity of the national sport in Jersey, has purchased a large farm three niles nearer to Long Branch village tban Monmouth Park, on which a mile track has been laid out with a view, so the story goes, of runniug an opposition racecourse, but if the truth is known, it will doubtless he found that the wily Tbeodore with his customary astuteness (?) has not tbe slightest intention of "bucking his head against a stone wall," and is only securing private training grounds for tbe stable of horses he now has, and which he is constantly and qnietly adding to all the time.

Catalogues, or rather lists, of tbe three great sales of yearlings in Kentucky this spring are out. Tbey are to be held a trifle earlier this year, and those who wish to attend the Lexington and Louisville races can do so, and the salee as well; the Runnymede sale of Bowen & Co. leads off on May 18 (Friday). The Swigert sale at the North Elkhorn farm, renamed the Elemendorf, follows on tbe next day, Saturday, and the famous old Woodburn, where the Alexanders will be the hosts, has its annual on Monday, May 21. The Louieville races begin the next day, which makes tbe arrangement a good one for all parties.

Your former townsman, Geo. M. Pinney, ie jnst now figuring very prominently in the courts here in connection with a suit for libel he has entered against two young brokers. His former troublous experiences in "Frisco" have doubtless familiarized him with the devious ways of justice, and he should hold hie own, if practice makes perfect, in any contest of thie sort which he undertakes.

Morse and his Passion Play are also very much before the public, and the chances are that the unfortunate Salmi will be once more obliged to lay on the shelf his sacrilegious play, for New Yorkers appear to want none of it.

John McCullough and a New Haven dominie were nearly in collision in that city a few daye ago by reason of an affront to one of the ladies of the company through the stupid mistake of a waiter, but the matter blew over and no one was hurt.

Quite a lucky circumstance happened to your correspondent on the occasion of last writing. The regular mail for California closes at the general post office at 4:30 p. m. It is my custom to send letters by the supplementary mail from the New York Central Railroad depot at 8:45 p. m. On the evening in question I just missed this mail hy a few minutes, and as this meant twenty-four hours' detention I was correspondingly out of humor that night. But on hearing next day of tbe destruction of the postal car by fire and all its contents, I found out what a fortunate miscbance it was.

Pacific.

THE KENNEL.

New Arrivals.—Quite an addition was made to the stock of sporting dogs hy tbe importation by Mr. S. Tyler of Santa Monica of a pair of fine Irish setters. They are handsome animals and have a proud pedigree. The bitch hae two strains of Rory O'More, one of Rnfus and Plunkett. The dog is sired by a son of Berkeley out of the imported bitch Pearl, the winner of the Queen's cup at the hench show at Birmingham, England. She was imported hy Wm. King of Minneapolis, familiarly known as "Bill" King, the prime mover in arranging the mammoth fairs for which Minneapolis is noted.

Coursing Postponed.—On account of the storm the coursing match which was to have taken place at Dixon Monday was postponed nntil February 22. The dogs were drawu for tbe match in Dixon on Friday last, and on Saturday pools were sold, Leake's Blue Jacket, the winner of the last match, being first choice, and Hollingsworth's Snip, second. Fifteen dogs are entered, and tbe pairs will stand as drawn until the match comes off—no more entries being allowed.

A Capital Show.—It is contemplated to hold a bench show in Washington, D. C., commencing February 2d or 3d, at the Rink, which is in every way well adapted for the purpose. Tbere is every probability that tbe gentlemen interested in tbe subject will carry it into effect; and if they do the valuable services of Mr. Lincoln will he secured as superintendent. A show in Washington ought to he a success.

Bench Show in New York.—The Westminster Kenuel Club have secured the Madison Square Garden for their show of 1883, aud will bold it in May. A very attractive programme will be offered, and everything done to make it eveu a more brilliant success than tbeir previous showe.

Death of Gladsome.—Captain Foster has lost hy death hia celebrated dog Gladsome by Gladstone.

ATHLETICS.

Harmon and Gibson.—Fred Harmon and Chas. F. Gibson ran a 150-yard race at Santa Cruz last Saturday, for $500 a side. Gibson won hy two feet in 15¼ seconds. Harmon thougbt he had an easy race and did not get into first-class condition. The genius who edits the San Jose *Mercury* gave the time of the race as 14½ seconds, bnt this was to he expected from a country newspaper. Tbe gentleman should spend 15 cents for a Clipper almanac and use it and he will not cut records with such a ruthless hand in tbe future.

The 100-yard match between Haley and Masterson will be decided thie afternoon at the old Recreation grounds, the only available place in the city at this time of tbe year. They are said to be in good condition, and both are reported to feel confident of winning the race easily. That's a good feeling to hegin with, and will help to make the struggle a hot one. They are both fast enough to run 100 yards in tbe best of amateur company, and if Myers or Brooks come out here this season they will make a good showing with either of the two Eastern champions. The entries in the open hundred include Jones of Placerville, Slater and Hawes of the Olympic Club, Bobby Rohinson of the University and Harris; all expecting to win first. Tbe track has beeu prepared specially for the occasion, aud is said to he a good one.

At the annual meeting of the Alameda County Sportsmen's Cluh, Isaac Upham was elected President, W. W. Haskell was elected Vice-President, Frank L. Fowler, Secretary, and W. D. Heatou, Treasurer. It was resolved that shooting at Mallard Statiou cease between the hours of 5 p. m. and 5 a. m.

POULTRY.

How Fowls Grind Their Food.

On this suhject S. Edward Todd discoursee as follows:

Fowls have no teeth to grind or masticate their food with, and the hest they can do with it is to pick it and swallow it whole. Kernels of grain are swallowed by them, and as they are surrounded by a tough pellicle or skin, which the juice of the stomach of the animal will not readily dissolve or digest, they could obtain no nourishment at all from fhe grain if thie tough pellicle was not broken.

Now, if we dissect the gizzard of a fowl of any kind, we find a lot of small gravel stones, which are usnally the hardest kind of flint, granite or sand stone. Surely here is a pocket addition of farm grist mills.

Fowls swallow their food, broken or not, and it enters the crop or first stomach and remains in it until it becomes softened more or less, when a emall quantity at a time, jnst as grain runs into a grist mill, is forced into the gizzard among the gravel stones. This gizzard is a strong, muscnlar stomach, and plays night and day when there is grist to grind, similar to a hellows, contracting at times, thns forcing the gravel stones into the grain and hreaking it into fragments and triturating the whole mass, after which it is in a suitahle condition to he quickly digested.

Followed a Friend's Advice.

New York.—Messrs. Gordon & Chase, proprietors of the well known Phœnix Stables, East Twenty-seventh street, and who owned the trotter Tom Sackffolk, etate that after trotting an eight mile heat race, their horse etrained his near hind leg, so that next morning he conld not touch his foot to the floor. The animal enffered severely, and after a month's treatment by a leading veterinarian, wae no better. A friend advised St. Jacobs Oil, which was tried, and effected a complete cure. The gentlemen further state, that in their forty years experience, they have fonnd nothing that can compare with the Oil as a cure.

It seldom pays to keep hens the third year. With age they become fat, lazy, and nnproductive, get diseased and die. Though they may not stop laying if well cared for, still they are not profitahle layers, and their flesh is not as valnahle as that of yonnger birds. In all cases there ehould he a succession of pullets for the prodnctiou of eggs, and to be fattened off as they cease laying. But if chickens are not wanted for sale, they are wanted to renew the stock of hens, as no one can deny the expediency of having pullets to add yearly to the old etock, so that no cock or hen shall he kept longer than three years.—*Poultry Monthly.*

Brown's Bronchial Troches for Coughs and Colds: "The only article of the kind which has done me good service. I want nothing hetter."—*Rev. R. H. Craig, Otisville, N. Y.* Sold only in boxes. Price 25c.

Market Report.

FLOUR—We qnote: Best City Extra, $5 50@$5 75; Superfine, $5@$5 25; 'Interior Extra, $4 75@$5 25; Interior Superfine, $3 75@$4 ℔ bbl.

WHEAT—There have been some large transactions during the week on shipping account on the hasis of $1 80 ℔ ctl., which is considered to be a high figure; Recent sales are No. 1, $1 80; do, fair shipping $1 72½; do, Sonora $1 77½; No. 1 White, March, $1 84@$1 84½.

BARLEY—The market in this grain is not very steady: Recent sales are No. 1 Feed, January, $1 22½; do, February, $1 23½; do, March, $1 25; do, May, $1 25; do, April, $1 25; Brewing, $1 37@$1 37½ per ctl.

OATS—Fair Feed, $1 70@$1 75; Good, $1 75@$1 80; Choice, $1 85@$1 90 ℔ ctl. Eastern, $1 55 ℔ ctl.

RYE—Business dull. Qnotable at $1 55@$1 75 for fair to good.

FEED—Ground Barley, $27@$29 ℔ ton; Cracked Corn, $35 ℔ ton. Shorts, $18@$20 ℔ ton. Oilcake meal the oilworks sell to the trade at $32 50 ℔ ton, less the usual discount. Middlings, $23@$25 ℔ ton for lots at the mill.

HAY—Alfalfa, $13@$14 50; Wheat, $15@$17; Wild Oat, $14 50@$15 50; Mixed, $11@$13 ℔ ton.

PROVISIONS—Eastern Hams, 18½@19½c; California Hams, 15¾@15c for plain, 15½@15c for sugar-cured canvased; Eastern Breakfast Bacon, 16½@17c; California Smoked Bacon 14½@15c for heavy and medium, and 15¾@16½c for light and extra light; Clear Sides, 15@15½c; Pork, $20@$21 for Extra Prime, $23 50 @24 for Prime Mess, $25 50@25 for Mess, $26 50 for clear and $27@27 50 for extra Clear; Pigs' Feet, $15@$18 ℔ hbl; Mess beef, $15 for bbls and $8 50 for hf bbls; Extra Mess Beef, $17 for hbls and $8 75 for half hls; Family Beef, $18@18 50 ℔ hbl; California Smoked Beef, 13½@14c ℔ ℔.

FRUIT—We quote: Apples, 30@50c for common and 75c@$1 25 ℔ bx for good; Lemons, $7@$8 per box for Sicily and $5@$5 for Malaga; California Lemons, $2 50 per hox; Limes, $9@$10 per hox for Mexican; Bananas, $1 50@$3 ℔ hunch; Mexican Oranges $20@$30 ℔ thousand; California, $2 50 @$4 50 ℔ hox; Pineapples, $8@$9 ℔ doz. New crop Western Cranberries are offering at $15@$17 ℔ hhl.

VEOETABLES—We quote: Marrowfat Squash, $5 @$8 ℔ ton; Carrots, 30@50c; Turnips, 75c@$1; Cauliflower, 75c@$1 ℔ dozen; Cabhage, 75c@$1 ℔ ctl; Garlic, 3½c ℔ ℔; Celery, 50c ℔ doz; Mushrooms, 8c per lb; Dried Okra, 15@20c; Dry Peppers, 12½@15c ℔ ℔.

POTATOES—River Red, 75@90c; Early Rose, 90c @$1 05; Tomales and Petaluma, $1@$1 25 ℔ ℔.

ONIONS—Fancy lots, $1; Good, 75@90c ℔ ctl.

BEANS—Bayos $4@$4 50; Butter, $3@$3 25 for small and $3 20@$3 30 for large; Lima, $3 50@$3 75; Pea, $3 25@$3 37½; Pink, $3 25@$3 50; Red, $3 25@$3 30; small White, $3 25@$3 37½; large White, $2 75@$3 ℔ ctl.

BUTTER—We quote johbing lots: Fancy, 25½@27c; choice, 25@25; fair to good, 22@24c; inferior lots from country stores, 17@22c; firkin, 25@25c for good to choice, and 20@23c for ordinary; pickled roll, 22½@24; Eastern, 18@22c ℔ ℔.

CHEESE—Fairly steady. California, 14@15c for choice; 11@13 for fair to good; do, factory, in boxes, $14@15; Eastern, 16@17c:

EGGS—California, 34@36c;

POULTRY—Live Turkeys, gobblers, 14@15c; do Hens, 14@15c; do dressed, 16@19c; Roosters, $5 50 @$7 for old and $7 50@$9 for young; Hens $7 @$8; Broilers, $6@$7, according to size; Ducks $9@$11 ℔ dozen; Geese, $2@$2 50 ℔ pair.

GAME—Light demand. Quail, $1 ℔ dozen; Mallard Ducks, $2 25@$2 50; Sprigs, $1 50@$2; Canvashack, $2 50@$3; Brandt, $1 25@1 50; Gray Geese $2@$3; White Geese, $1 26@$1 50; Honkers, $4@$4 50; Snipe, $1 75@$2 for English and 50@75c for common; Teal, 75c@$1; Widgeon, $1@$1 25; Hare, $1 75@$2 25; Rabbits, $1 25@$1 75.

WOOL—No change in prices. We quote fall: San Joaquin and coast, 8@12c; San Joaquin and coast Lamb, good, 11@12c; Northern Fall, free, 15@20c; Northern Fall, defective, 11@15c; Northern fall, Lamb, 15@20c; free Mountain, 11@15c. Eastern Oregon, 10@23c; Valley Oregon, 22@25c. We quote spring California ℔ ℔ 14@20c.

HIDES AND SKINS—Dry hides, usual selection, 19c ℔ ℔; culls one third less, and Mexican Hides 1c ℔ ℔ less. Dry Kip, 19c; Dry Calf, 20@22c; Salted Steers, over 55 ℔s, 11c ℔ ℔; Steers and Cows, medium, 10c; light do, 9c; Salted Kip, 15 to 30 ℔s, 11c; Salted Calf, 14@15c ℔ ℔; Salted Veal, 12½ @15c; Sheep Skins, 25@30c for Shearlings; 30 @50c for short, 60@90c for medium, and $1@$1 35 apeice for long wool and wool skins. Butchertown Green Skins bring higher prices.

TALLOW—Quotable at 7½c@8½c ℔ ℔ for rendered and 11@12c for refined, both in shipping order.

MEATS—Following are rates for whole carcasses from slaughterers to dealers:

BEEF—Prime, 9@10c; medium grade, 7½@8c; inferior, 5½@5½c ℔ ℔.

VEAL—Large Calves, 8@9c; small ones, 9@10c ℔ ℔.

MUTTON—Wethers are quotable at 5½@5c and Ewes at 5@5½c ℔ ℔, according to quality.

LAMB—Quotable at 5½@7c ℔ ℔.

PORK—Live Hogs, 5¾@5¾c for hard and 5¾c@5½ for soft; dressed do 9@9½c ℔ ℔ for hard grsin hogs.

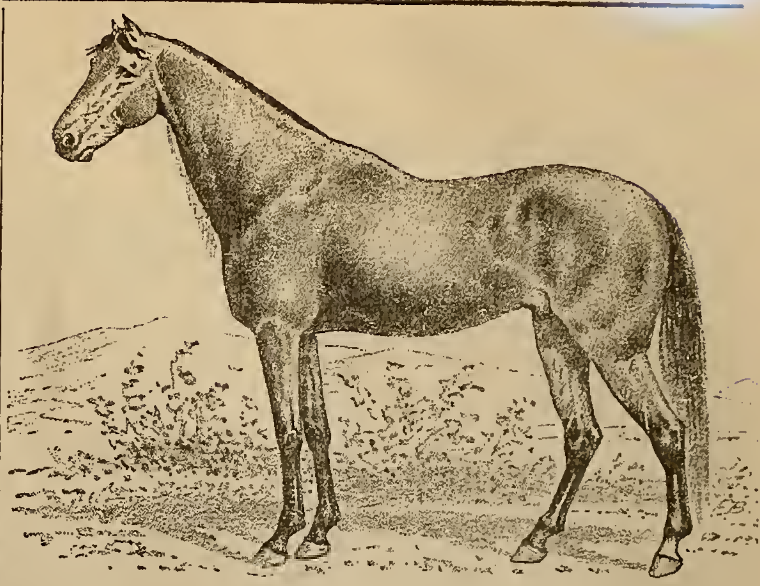
PRICE $5.00.



ALBERT W.

By Electioneer. His Dam Sister to Aurora by John Nelson.

WILL MAKE THE ENSUINO SEASON, COMMENCINO THE 15TH OF FEBRUARY, 1883, AND ending the 1st of July, 1883, at the Oakland Trotting Park.,

TERMS, $200 THE SEASON.

MONEY PAYABLE BEFORE THE MARE IS TAKEN AWAY. GOOD PASTURAGE AT $5 PER month. No responsibility for accidents or escapes.

No. 320 Sansome street, San Francisco, Cal. A. WALDSTEIN.

MAMBRINO

Trotting Stallion ABBOTSFORD.

(Record at Six Years old, 2:21½.)

PEDIGREE.

BY WOODFORD MAMBRINO, HIS DAM COLUMBIA BY YOUNG OOLUMBUS. WOODFORD Mambrino by Mambrino Chief, his dam Woodbine by Woodford, a thoroughbred son of Kosciusko.

Woodford Mambrino is recognized to be the best son of Mambrino Chief. His own record is 2:21¼, and there are a large number of his get in the 2:30 list. Among them: Abbottsford, 2:21¼; Convoy, 2:22¼; Magenta, 2:24¼; Lady McFatridge, 2:29; Dacia, 2;29¼; George A. Ayer, 2:30.

Besides tbose having public records, he is the sire of the two celebrated mares owned by Robert Bonner—Manetta and Malice. Manetta, with a ruuniug mate, aud harnessed to a road wagon, trotted two miles in 4:27¼, and Malice trotted a trial, on tbe same track, a mile in 2:19¼. Woodford Mambrino is also the sire of Princeps, the sire of Trinket; record, 2:14. Woodbine is also the dam of Wedgewood, record, 2:19. Young Columbus, the sire of the dam of Abbottsford, has nine of his get in the 2:30 list, so tbat on both sides of the house there are notable performers. Abbotsford is a rich rosewood brown, 15¾ hands, and of very high form. His get are very promising, his daughter Jasmine having won the Embryo Stake for yearlings in 1881, aud every one whicb has been put in training has shown good speed.

TERMS.

Seventy-five dollars the season, to he paid before removing the animal. Mares not proving in foal can bo returned the following season free of charge. Good pasturage at reasonable rates, and extra pains taken, but no liability for accidents or escapes.

LOCATION.

Abbotsford will make the ensuing season, 1883, on the rauch of S. B. Whipple, Esq., San Mateo, season commencing February 15th and ending June 1st, 1883. For full history see the issue of BREEDER AND SPORTSMAN of August 5th, 1882.

FISH.

Trout Tickling—How to Do It.

Not tickle a tront! Not tickle a ——! Well, what next? Why, the only real, true, and certain way of filling a creel on a hot July afternoon is by the same "tickling." I don't mean to say that it is right, particularly if you tell tarraddidles about it afterwards; but depend on't it is to be done, and is done, worse luck! in every tronting country in England. Oddly enough, I never heard much of it in Scotland.

Suppose a low, bright, brokeu stream, with lots of big stones iu its bed, a blaziug hot day, and as much chance of catching a sword-fish as a trout by auy other means. Nothing to eat at Withypool but the eternal eggs and bacon, and the certainty that somebody or another is "at it" every day of the week. We'll do it! Walking down to the stream, we heave rocks and handfuls of gravel into every likely stickle and hover, cansiug the astonished tront to ram themselves headforemost under the big stones and into the rat holes in a paroxysm of abject terror. Now, off with yonr coat and waistcoat, roll your sleeves up to the shonlder, and splash into tbe pool as noisily as you can. Where shall we begin? There is a big bonlder in abont two feet of water, which looks from the contour of that side as if there might be a hollow place nnder it. Down on your knees before it. Gently, gently feel your way down the side. Yes, there is a vacancy under it, into which yon slide your two hands as gingerly as if you were trying to steal the cheese out of a rat trap, the palms a little turued npward, and the fingers slightly bent. Aha! What is that, that brushes the right palm with a touch as light as a kiss? Wait a bit. Yes, now comes the steady sweeping play of what can only be the tail of a nohle trout, backward and forward over your immovable palm. Gently, gently close the finger and thumb above it; lightly touch the body of the fish, softly as falling snowflakes, till yon come to another pair of fins, then panse a little, this abominable pair of fins are rather difficult to pass. Shall I try with my right hand, or shall I, still feeling them with it, pass my left at once beyond them till I come to—— aha! what is tbis again? This is not the wavy movement of a fin; this must be tbe steady regular play of the gill covers; and so, letting them lightly toncb my finger and thnmb once or twice to make snre of my position, contract them with one strong squeeze. A moment's paralysis, and out with your heanty, high up into the air, to flounce and flutter in the heather on the bank. Ah! it is pleasant, this playing with the unseen, and soft and dainty is the speckled skin to the judicious tickler, who lets the trout touch him rather more than he tonches the trout. Should you donbt this being an interesting form of sport, get an adept to do it before you, and, seating yourself on a neighboring stone, watch his expressive countenance cocked np, blinking sunward, and mark every gleam and gloom, joy, despair, hope, doubt and triumph, as they chase each other across it, as they do over that of a blind musician developing deep sympathies ont of the (to him) invisible organ, tamed into melody by his dainty fingers; and you will never doubt more, but roll up your sleeves incontinently, and "wade in." There are many other forms of tickling suited to heavier waters and heavier tront, forms only too deadly among the long, waving weed masses of a Hampshire chalk stream, or the hollowed-ont banks of a Wiltshire grayling brook. But even I, given to poaching as I have been from my youth np, would hesitate to profane such sanctuaries.

It is an art that all travelers shonld nnderstand, as it might serve them in good stead at a pinch; and, poaching though it be, given a small steam, swarmiug with small fish, the proper weather, the impossibility of catching fish in any other way, and the absolnte necessity of having fish, and the thing is not so bad—possibly all the better for beging a wee bit naughty.—*Ex.*

Trout Breeding.

Mr. Levi Hodges, of Hartford, Conn., recently gave a practical lecture on trout breeding to a large and appreciative audience. His experience in fish culture dnring the past ten years has been large and nseful. From this essay we quote:

"A tront breeder, to be successfnl, mnst be in earnest, and mnst spend a great deal of time and labor. He must have a stream of pure water, and be sure there is plenty of water during the hot season; the ponds shonld be located on high ground, and securely guarded against freshets. The hatching house should be about 16x40 feet, which would be large enongh for 100,000 eggs. The ponds should be small, and about fonr to six feet deep. There should be a small pond in the hatching house for the very young fish, as, when placed in the other ponds, millions are lost every year. Great pains shonld be taken to make the ponds secure. The hatching boxes should be on the north side of the house, where the snn cannot reach them. The eggs are at first colorless, but change to a straw color. The eggs will hatch themselves hy being placed in water; spring water is the best. Tbe hatching trongh should be divided into nests, and will hold from 500 to 5,000 eggs. The greatest tronble while hatching is experienced from the snnlight sediment in water and rats and mice, which eat thonsands of the eggs. The larger fish are males and the smaller ones females; care should be taken not to dispose of all the small fish. The breeder has little tronble during the late spriug and snmmer, and large fish can be raised with little trouble. The eggs, when shipped, should be packed in moss, and can be safely sent 1,000 miles. The small fish can be sent in water—a gallon holding thousands—and in warm weather ice should be used to keep the water cool. The question is asked: 'Does it pay?' It takes time and labor, like everythiug else; but any farmer can easily raise plenty of fiue trout for his own use, at little cost." Tbe speaker, when questioned, stated that trout caught in his own pond were not as good to eat as the tront caught in runniug brooks. Mr. Hodges exhibited eggs in different stages of hatching, and young fish recently hatched."

An Interesting Ceremony.—Last Sunday, says tbe Virginia (Nev.) *Enterprise*, a deputation of leading citizens of Austiu marched to the Reese river, headed hy a fife and drum, and after a prayer by tbe chaplain, committed to the waters of the stream four white bass, sent to tbe authorities of Lauder county by State Fish Commissioner Parker. After the fishes were duly lanuched in their native element, a closing hymn was sung, and the processiou returned to town. An Austin statisticiau who figured upon the probable iucrease of the plant at the end of four years was the next day declared insane by a commission of physicians and will be sent to the State Insane Asylum at Reno. In his ravings tbe mathematician talks of millions on millions of bass crowding the whole length and breadth of Reese river, and clamors for the County Commissioner to at once take steps for setting back the banks of the stream in order to make room for the vast schools of fish he can see still coming.

Effect of Cold on Bay Fishes.—After the first cold snap striped bass and porgies left the waters of Barnegat Bay aud went up Tom's River where they were found lying along the sunny shores in a numb condition, so much so that they were caught by the inhabitants with crab nets and even with the hand. This condition of affairs lasted for several days, and thonsands were taken up by men and boys.

Says the *Herald:* A curiosity in the shape of a fish was on exhibition at an Albany fish and vegetable market yesterday. It was about a foot long, had two legs, a Roman nose ornamented with a curved arrangement that looked as if it might be intended to hang up by, and a wicked looking mouth formed of two semi-circles of a shell-like snbstance, strong and sharp. It arrived among a lot of smaller fish and excited a good deal of atteution, though no one knew exactly to what species it belonged. The Reno *Gazette* says of another curiosity: They have a fish at Bolinas which puzzles the native experts. It came ashore at Eskeet's beach, and measnres twenty-eight feet four inches from head to tail, and five feet through. The fishermen say that it is neither whale nor shark, and that they never saw the species before.

Be carefnl to put back all the small fish, and encourage others to do the same. There is no telling the beneficial effects of one angler advising another to obey the law. It is to my notion better than enforcing it. Every true member of the craft shonld feel himself to be a kind of river keeper, and by the law of kindness and example stimulate those feelings that would teach all men to become faithfnl disciples of the rod. There is nothing more sweet in the journey of life than gently breaking down tbe rugged paths and making rough places plain, and amongst anglers, especially, there exists such a brotherhood that the practice of those feelings can easily become manifest.—*Angler.*

A salmon fishery has been started at the mouth of the Salinas river by a party of Monterey capitalists. They are making a good catch and are shipping large numbers of fish to market every day.

Lots of salmon trout are being canght at Duncan's mills. One man recently brought in 200 pounds of these fish.

The cold weather during the holidays kept all the anglers at home and there is not much to report of their doing.

Tbere has not been much luck with the flounders in Oakland creek lately.

To Teach a Horse How to Back and to Lead.

Take him to the top of a rather steep piece of ground, stand his hind feet down tbe slope, throw the bridle reins over the neck, place yonrself in front, and take hold of them on each side of the head close up to the bit. Now press the bit against the side of the mouth, and speak gently—"back, back"—and the horse will soon learn to do this. Next, take him to the top of the ground not quite so steep and pursue the same course. When the horse has learned to back readily down hill, he can be taken on to level gronnd to do it. As soon as this lesson is well taught, haruess him to a light, empty wagon, and go through the same course. When completed, jump into the wagon, take the reins in hand, pull on them, at the same time speaking to him, "back, back," and thus keep up the discipline till the animal is perfect in it. If he has a mate, after both are well instructed, they can be harnessed together and drilled till perfect in backing.

Tbree things, as above stated, mnst be strictly observed: First, to place the horse with his back down descending ground; second, when harnessed, let it be to a light, empty wagon, which requires the least possible effort to back it; third, be perfectly kind to the horse, speak gently, pat it on the neck, stroke down its face with the hand, and on no acconnt strike it. As soon as the horse understands what is wanted of him, he will do it with alacrity. It is not from ill-temper or stubbornness that a horse does not back at once when spoken to; it is from sheer ignorance. He does not know what is wanted, or to do it, nntil gently tanght.

A second method is to harness the horse to another well broken to back, and set the hind end of the wagon on a sloping piece of ground, and follow the directions above, or jump into the wagon and take the reins in hand; but it is better to discipline alone at first, as above.

To teach a horse to lead, let a man or boy take the end of the bridle in hand and gently pull on it, while another holds out a dish with grain or meal in it. The horse will tben advance to it. Now let him nibble a small quantity, then move with the dish a little fnrther in front, and so keep on till he is tanght to lead well. He can also be tanght by putting him alongside of another horse which leads easily. He ought to be rather hungry when thus drilled, so he will come np eagerly to the dish of grain.—*Rural New Yorker.*

An Extraordinary Surgical Operation.

A recent extraordinary surgical operation has created quite a sensation here. A young waiter in one of the cafes bet he could swallow a spoon after the manner of those mountebanks who swallow swords. Unfortunately the spoon, although nine inches long, slipped from between his fingers and descended into the pit of his stomach. Unsuccessful efforts were made to regain it hy means of an instrument passed down the esophagus. The man was then removed to the Hospital Lariboisien, where the eminent surgeon, Dr. Felizel, successfully performed the operation of opening the stomach by means of an incision and extracting the spoon therefrom.

The stomach had previously beeu dilated by meaus of vapor of ether. This delicate operation lasted three-quarters of an hour, during which time the patient was kept under the influence of chloroform. What with his stomach full of ether and his brain full of chloroform, he must have heeu in a funny state. At last accounts he was doing remarkably well, and tbe doctors think he will be able to leave the hospital in a few days. Remarkable as this case may seem, it is not the only one of the kind. The medical records cite numerous instances of persons swallowing forks, spoons, a bar of lead weighing nearly a pound, and a long list of things so extraordinary that to enumerate them would seem like a too reckless flight of imagination, and of their successfully being relieved of tbese indigestible articles, either iu a natural way or hy tbe help of surgery.—*Paris Cor.*

We bave received the Christmas number of the S. F. Breeder and Sportsman, which contains a beautiful colored picture of tbe famous horse Albert W, by Electioneer, sister to Aurora by Jobu Nelson, and owned by Mr. Waldstein, of San Francisco. With this number is also a lifelike picture of two boys in trouble, both seated on a lively but gentle horse, holding the horse's mane, having lost their hold of the halter, which dropped down between the animal's forelegs. The two little chaps look badly scared, while the horse thinks he is traveliug iu a good trot to suit, and two little barking followers think it is fun.—*Yreka Journal.*

Farming at Westminster, Cal.

I wonld like to give you some figures on the actual points of farming iu Westminster. We have so many fancy sketches of the profitableness of various prodnctions in Sonthern California, that it is a relief to turn from expectations and dreams of future possibilites to real life and cash returns. Here is a balance sheet of one of our best stock farmers, from Jannary 1st, 1882, to December 18th, 1882, a little less than one year. He has had the assistance of his son of fifteen years, and his wife has been assisted by her daughters of sixteen and eleven years. The credit side gives the actual money returns, including also forty tons of hay more than he begau the year with, and which he does not expect to nse. The debit side shows that he had eight head of cattle less than he began the year with, of which four died, so that he has only reduced his stock four by sales. He is also carryiug $30 less of stock hogs. The labor hired could have been done by himself, bnt he was occupied in making permanent improvements at the time:

HENRY STEPHENS, JAN. 1ST TO DEC. 18TH.

Cr.	
Beef cattle, sold	$258 80
Hay, sold	1 2 00
Butter, sold	480 55
Fruit, sold	53 00
Extra hay, sold	320 00
Hogs, fat and stock, sold	723 00
Pasturage	53 00
Total	$2267 35
Dr.	
Reduction in cattle	$350 00
Reduction in stock hogs	30 00
Labor hired	60 00
Total	$340 00
Net Profits	$1927 35

As he farms only sixty acres out of eighty acres, the other twenty acres being only nsefnl for wild feed on the defective land, the profit per acre is over $30, and he is certainly making a comfortable living. The profit per acre is far below the profits of oranges and raisins and orchard fruit culture, as figured on paper, or that may be fairly expected in future. But many a pure horticulturist wonld like to exchange some of the poetry of his bnsiness for a division of this pocket-book. And it might be wisdom on the part of many to combiue these two forms of farming, fruit and stock, as can be done in Westminster. They can thns take the profit together at once, and by and by combine both profits, or dispose of the smaller one or the least suited to their tastes. I have given you an example of a pure stock farm. Some of our corn-land farmers conld, I understand, double these figures.—*Cor. Anaheim Gazette.*

The Interesting Texas Centipede.

This interesting insect is not so much celebrated for its amiability of disposition as for its good looks, bnt, at the same time, we cannot recommend it either as a parlor ornament or as a toy for a child to play with, nnless it is a second-hand child that no one has any particular use for. Centipedes are different sizes, but they are all made after pretty much the same pattern. They are made up of about one-third sting, one-third hite and one-third general cussedness. They are casemated with a shell that is as hard as the bark of a boarding-house cranberry pie. The lengtb of the centipede varies very mnch, but if a centipede wants to get a mention in a local paper he has to stretch himself ont to about nine inches in length. We have never read of one that measured less. His body, which is a snccession of flat joints, is not mnch broader than an ordinary man's finger. The centipede is bnilt on the iron-clad system, although it does not make quite as mnch noise as the English fleet bombarding Alexandria. In fact, the centipede is not musical at all, but if it happens to crawl over a man it will make him very musical immediately.

Its head or how, comparing it to an ironclad, is armed with a pair of pincers, which, besides being as venomous as the editor of a party organ, can bite the end off an iron safe. Each side is armed with about forty short legs, and each leg is armed with a sting like that of a wasp. The centipede terminates in a pair of hooks, which, like its pincers, are red hot, so we have been told by an innocent young man who undertook to pick it np by its stem. When a centipede anchors his head in the fleshy anatomy of a human being, throws ont his two grappling irons from his rear, and then draws his eighty odd, very odd, claws together, it will bring tears to the heart of an Irish landlord to see how the little pet holds.

The bite of the centipede rarely causes death, bnt it makes the bitten party wish he were dead for a short time, at least, and leaves an ugly sore. The statement that the bite of a centipede does not cause death is liable to correction. The centipede is very apt to become a "remains" after it bites a person, as there is quite a prejudice against it. For this reason it is very mnch secluded in its habits, living in retirement among the rocks of old bnildings. Its diet is believed to be insects that are not so heavily armed and iron-clad. Why the centipede was created in the first place, and what good purpose it serves, are profound mysteries to the ordinary intellect.

One evening about dusk a Texas gentleman of a scientific turn of mind was sitting on his front gallery, when his attention was called to an extraordinary meteorological concatenation, as circus men say. A peculiar-shaped cloud seemed to reach down from the sky and then draw itself up again, very much after the manner of those cyclonic clouds in Iowa. The gentleman was very much interested in this meteorological perturbation, which he attributed at first to atmospheric influences, when it occurred to him that the peculiar cloud or water-spout might be nearer than the distant horizon. He took off his hat and found that his surmise was correct. Fastened to the rim of the hat hy its hind claws was a beautiful centipede, about nine inches long. The peculiar meteorological phenomena were produced by the insect drawing itself up and letting itself down in its efforts to find a nose or some other feature to hang on to in order to facilitate its descent. As the gentleman had a comparatively short nose the insect was foiled. It died shortly afterward by the gentleman accidentally stepping on it about a dozen consecutive times with the heel of his boot.

As we have already stated, centipedes are comparatively rare in the well-settled portion of Texas, being usually found in a bottle of alcohol on the showcase of some druggist who has a taste for the beautiful. In this particular centipedes differ from some men: They are much more peaceful and harmless when in liquor than otherwise. With centipedes, as with Indians, the only good ones are those that are dead.—*Texas Siftings.*

The last number of the Breeder and Sportsman is a splendid one. It contains a colored lithograph of Albert W, a noted trotter. The same number contains a charming lithograph, "Boys in Trouble." Joe Simpson is making his journal one of the best published.—*Sutter Farmer.*

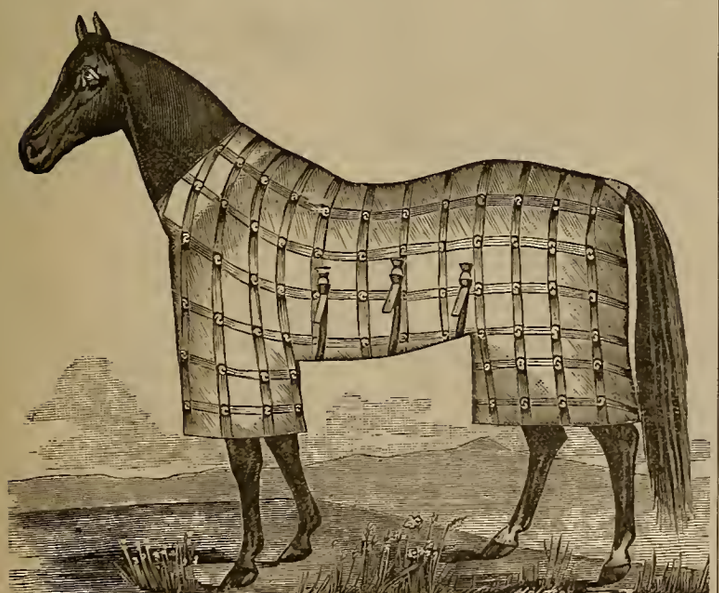
IMPROVED HORSE CLOTHING.



Secured by Letters Patent ISSUED MAY 27, 1879. REISSUED MAR. 29, 1881.

The above cut represents the body-piece, the patent also covering the improvements in the hood. The following are the claims granted:

1. An improved blanket or covering, consisting of the body-piece A, flap C, and the extension B, formed or united together, so as to cover the body and legs of the animal, substantially as herein described.

2. The blanket or covering A, having the flap C, and the extensions B, to fit the fore and hind legs of the animal, front fastenings F G, and the permanent straps or bands E, substantially as and for the purpose herein described.

3. The blanket or covering A, with its extensions B, permanent securing-bands E, and the front fastenings F G, in combination with the elastic neck-extension H, substantially as and for the purpose herein described.

4. The blanket A and hood J, in combination with the elastic connecting-strip I, substantially as described, and for the purpose set forth.

5. The close-fitting hood J, having the elastic band L beneath the jaws, so that they may be allowed to move without disturbing the fit, and adapted to be secured to the cover by means of straps, substantially as herein described.

6. The improvement in covering-blankets for animals, consisting of the blanket A, having the flap C, and permanent straps or bands fixed to it to secure it around the body, whereby the use of loose surcingles is avoided, substantially as herein described.

The right to make clothing in the United States will be sold on a royalty. Apply to the patentee,

JOS. CAIRN SIMPSON,

SAN FRANCISCO, CAL.

TO

Sportsmen & Pleasure-Seekers.

THE

SOUTHERN PACIFIC R. R. CO.

RESPECTFULLY CALLS ATTENTION TO THE

SUPERIOR FACILITIES

AFFORDED BY THEIR LINE FOR REACHING with speed and comfort the best places in the State for

Sea Bathing, Shooting and Fishing.

TRAINS LEAVE SAN FRANCISCO DAILY FOR

MONTEREY,

THE MOST CHARMING

Summer and Winter Resort of the Pacific Coast,

with its beautiful Groves and delightful Drives. Trout in abundance can be obtained from the several streams in the vicinity of Monterey, and the best shooting may be had in season.

THE BAY OF MONTEREY

Is noted for the extent and variety of fish which abound in its waters, notably Salmon, Rock Cod, Barracuda, Pompino, Spanish Mackerel, and Flounder. The above-mentioned attractions, in connection with the low rates of fare, rapid transit, and the superior accommodations furnished at the "HOTEL DEL MONTE," have made Monterey a paradise for sportsmen.

THE BATHING ESTABLISHMENT

OF THE

"HOTEL DEL MONTE,"

IS UNSURPASSED.

A SPACIOUS SWIMMING TANK

(150 x 50 feet)

FOR WARM SALT WATER, PLUNGE AND SWIMMING BATHS.

ELEGANT ROOMS

For Individual Baths with DOUCHE and SHOWER facilities.

MAGNIFICENT BEACH

Of pure white sand for SURF BATHING, Etc., Etc.

THE FAVORITE ROUTE to those well-known Watering Places,

APTOS, SOQUEL AND SANTA CRUZ,

IS VIA THE

Southern Pacific Railroad,

(Broad Gauge), and the

SANTA CRUZ RAILROAD.

☞ At PAJARO, the SANTA CRUZ R. R. connects daily with Trains of the S. P. R. R.

The S. P. R. R. runs through the counties of San Mateo, Santa Clara, San Benito, Santa Cruz and Monterey, in each of which game abounds in great variety. Notably

Quail, Pigeon, Snipe, Duck, Geese, Deer and Bear.

Lakes PILARCITOS and SAN ANDREAS are reached by this line. Stages connect with trains daily at San Mateo for those well-known Retreats, PURISSIMA, SAN GREGORIO and PESCADERO. We would particularly call attention to the unlimited extent of range at and about SAN BRUNO and McMAHONS for RIFLE PRACTICE.

These resorts are but a short distance from San Francisco and offer special inducements to the lovers of this manly sport.

SPECIAL NOTICE.

Sportsmen and others presenting Passage Tickets of any description issued by this Company will be entitled to

FREE TRANSPORTATION OF THEIR DOGS

when carried in Baggage Cars and put in charge of Train Baggagemen. Train Baggagemen are instructed to issue CHECKS for all dogs received in Baggage Cars.

☞ In order to guard against accidents to Dogs while in transit, it is necessary that they be provided with COLLAR AND CHAIN. Guns and Fishing Tackle checked and carried free of charge. Guns taken apart and securely packed in wood or leather cases may be taken in Passenger Cars.

TICKET OFFICES.—Passenger Depot, Townsend street, and No. 2 New Montgomery street, Palace Hotel.

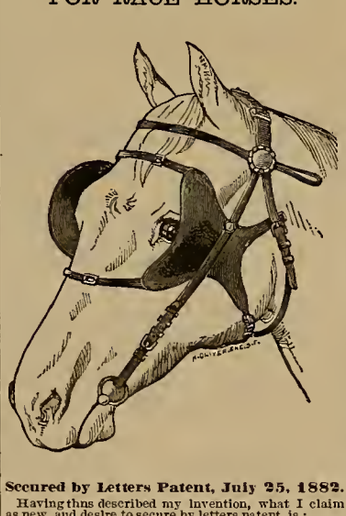
IMPROVED
Blind Bridle & Winkers
FOR RACE HORSES.



Secured by Letters Patent, July 25, 1882.
Having thus described my invention, what I claim as new, and desire to secure by letters patent, is:
1. The part D, supported by the side straps of the bridle, extending back, as shown, the front having an opening into which the blind is fitted, substantially as herein described.
2. In a bridle, in combination with the extensions D, the curved blinds F, secured to said extensions, and as shaped, to give full freedom and ventilation to the eye while circumscribing the vision, substantially as herein described.
3. In a bridle, and in combination with the extensions D, blinds F, and side straps A, the screw, nut and washer E, to secure the blind and allow it to be set, substantially as herein described.
4. In a bridle, and in combination with the check-pieces D and blinds F, as shown, the straps or bands G and H, connecting the branches or extensions above and below the eyes, and having the adjusting slides or buckles, substantially as and for the purpose herein described.
5. In a bridle, and in combination with the blinds F, supported and pivoted to the bridle so as to be movable about the point of support, the adjustable front straps or bands G and H, and the rear band I and the throat-latch or lash connected with the blinds, and adjustable, substantially as herein described.
The above are the claims allowed by the patent office, and though the corresponding letters do not appear on the cut, the general principle will be understood.
It meets with universal approbation, doing away with all the objections urged against blinds, and at the same time giving complete control of the line of vision. By throwing the lower portion of the blind up something of the same effect on the action follows as is induced by toe-weights. This is especially the case when young colts are the pupils, teaching them to bend the knee without the strain of weights on the feet.
For bridles of all descriptions apply to
JOHN A. McKERRON,
No. 327 Sutter street, San Francisco.

SPECIAL ATTENTION given to the manufacture of "boots" of all kinds for horses. Can refer to all the principal trainers and horsemen on the Pacific Coast.
N. B.—My acknowledged superiority in this branch of business is largely due to careful observation and the valuable suggestions of the most skillful turfmen of the United States, the benefits of which revert to the public in the shape of a GENUINE WELL-FITTING ARTICLE. Sole agent for Dr. A. H. Dixon's Condition Powders and for Makinney's patent "Eureka" and "Eclipse" Toe Weights. Repairing done with neatness and dispatch. Has always on hand the finest assortment of English ladies' and gentlemen's saddles, bridles, whips, spurs, bits and 2¼-lb race saddles.

EQUINE DENTISTRY.
HORSEMEN, ATTENTION.
PROF. H. W. WOODRUFF, LATE FROM BOSTON, is located in this city and will make the practice of veterinary dentistry a specialty. He treats no diseases but those of the teeth and mouth. Bit lugging, driving on one rein, balking, bolting, tossing the head while driving, fretting on the bit, drooling and foaming at the mouth, and many other faults are in nine out of ten cases due to bad teeth. Bad teeth not only cause bad habits, but they are the cause of such diseases as paralysis of the stomach, stomach staggers, flatulent and spasmodic colic, fits, indigestion, dyspepsia and other kindred stomach troubles too numerous to mention, through painful and imperfect mastication of food, the sure consequence of disordered teeth. The Professor can be consulted at his office at the Fashion stables, 221 Ellis street. Office hours from 8 to 9:30 a. m., 1 to 2:30 and 6:30 to 7:30 p. m., Tuesdays excepted, when he will be at Thirteenth street stables in Oakland. Orders left at the Club stables, Taylor street, and the St. George, Bush street, or by mail, will receive prompt attention. Consultation and examination gratis.
N. B.—Particular attention paid to gents' drivers.

H. H. WILSON & SON

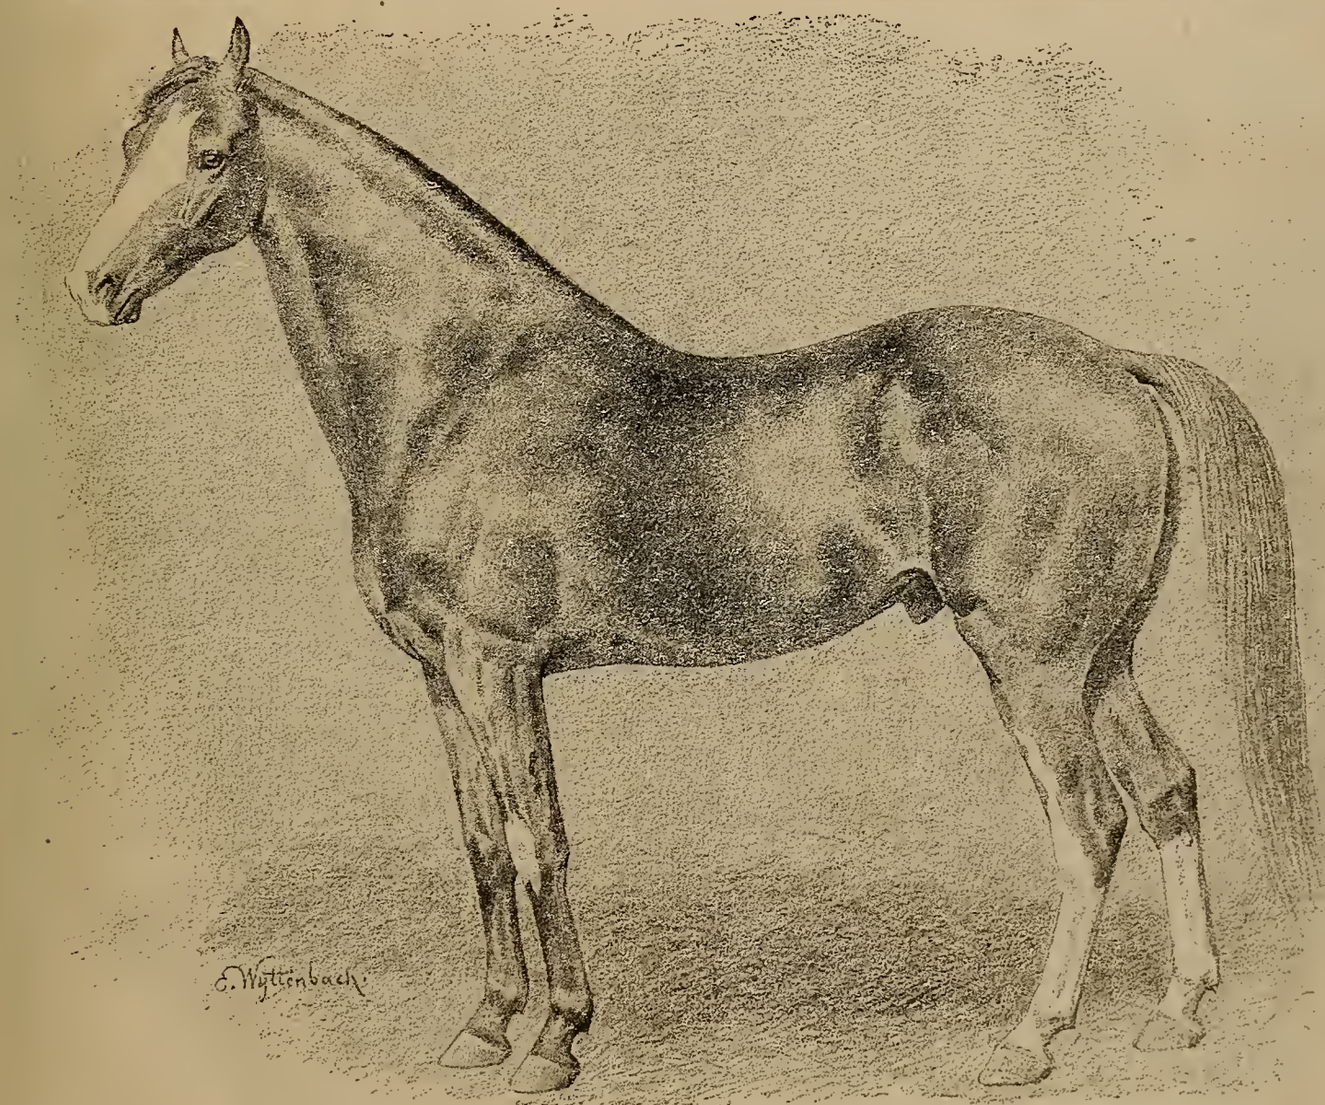
FIVE DOLLARS A YEAR.



JOE HOOKER.

BY MONDAY—HIS DAM MAYFLOWER BY IMPORTED ECLIPSE.

OWNED BY THEO. WINTERS, ——— FARM, SACRAMENTO CO., CAL.

Mr. Winters must fill the above blank. There is nothing more awkward than to write of a breeding farm that has not been christened, and when that farm is the domicile of such stock as graces the fields, the paddocks and the stalls, when it is a grand estate of over one thousand acres of as good land as there is in this fertile State, when Nature has given it all the advantages that could be asked for for the breeding of horses, when it is as beautiful as it is productive, the necessity is still greater. Then the improvements already made and in contemplation will be worthy of the natural site, and when the plans of Mr. Winters are carried to completion we have not the least hesitancy in predicting that it will be the boss place in the United States for the rearing and training of racehorses. When the leaves clothe the oaks and the spring is far enough advanced to make the trip still more enjoyable, we intend to accompany our artist, in order to give a pictorial sketch and a full description of the place, and then we think we shall so hatchel the proprietor that he will be willing to christen it. He was very happy in the selection of a name for the Yolo county farm, and El Arroyo was not only euphonious, as it was also exact.

But we do not intend to enter into a disquisition on names or places, the intention being in this article to give a short description of a horse, which, in our estimation, is destined to take a prominent place among the thoroughbred sires of the world. This is predicted, not so much on what he has shown (though every colt of his that has been trained has exhibited remarkable speed), as his form and breeding. His form is a wonderful combination of strength and quality. In all the stallions that we have seen we do not remember one of the same configuration. He is massive and yet as "fine" as a horse of two hundred pounds less weight. He has bone and tendon enough for a drayhorse, and yet there not a particle of coarseness. From point of shoulder to point of buttock he is of great length, and yet between the spring of the withers and the coupling a fourteen-inch saddle would cover the intervening space. He is a mass of muscle. Gaskins, upper thigh, quarters and loin are a study. The muscles round the quarters into fullness; those of the thigh and gaskin protrude so prominently that at first sight the observer is under the impression that something m[illegible]

(CONCLUDED ON PAGE 44.)

TURF AND TRACK.

BONNIE SCOTLAND.

The First Place in the List of Winning Sires.

We regard Vigilant, of the New York *Spirit of the Times*, as one of the most pleasing writers on racing and kindred topics there is in the whole field of that kind of journalism, and when the topic is one of so much interest to us as the following it has still greater fascination than arises from a pleasant style and good sense.

The interest we feel in Bonnie Scotland and his get does not arise from having owned him for a short time. Long before that we were an admirer, and became the more enthusiastic when it was a single-handed battle against the knights of the equine quill. The name was something, "Old Queen Mary' was another, and when we saw the invincible game of Surprise, the speed and game of Scotland, we felt assured that there was a high mark for the son and sire in store. But there is one point nearly always overlooked in the history of Bonnie Scotland and that is his success in the stud before going to Belle Meade. This arises from the persistent efforts that were made to detract from his merit. From the outset he was successful, more than successful, when the attending circumstances are taken into consideration. When Mr. Reber first commenced to rear thoroughbred horses he was unaware of the necessity of good feeding and the best of care, and Dangerous was reared in accordance with the idea that governed him at the time. Nevertheless he was a great horse, and though beaten by Idlewild and Jerome Edgar it was claimed that he ran the four miles fully as fast as that of his mother which, for so long a time, was the "top notch." From two mares Mr. Reber bred Surprise, Scotland, Andes, Columbia, Wauanita, Malcom, Ontario, Regent, Liverpool, Lady Fairfield, all winners, some of them of very high class. He also bred M. H. Johnston, a capital horse, Fanny Brown and several others. Nell Gwinne was one of the best campaigners of her day, and Lobelia was the crack when obstacles had to be overcome. Frogtown ran the fastest three miles ever made on the Lexington course, and so the list could be extended. The Bonnie Scotlands from Lady Lancaster could all race; Malcom, Ontario, and Regent with the same chances would be worthy to rank with Luke Blackburn, and Blinkiron from Magenta was one of the best race horses we ever saw run. Those from Young Fashion could run fast and "go the route" and if Scotland had been in good hands we doubt if there was a horse in the country that could have beaten him from one to four miles.

Vigilant alludes to Scotland having beaten Asteroid a heat. It was altogether surprising that he could run at all on that day. According to our recollection it was only two days before when his trainer determined to give him a trial run. He asked John Ford and us to time him. The track was extremely heavy, and with his weight up, and in the shoes of the period, the set weighing three pounds, he ran in 1:47. His trainer was on a spree, and those who remember Ed Y—— know how crazy he was at such a time. He insisted we were fooling him, reiterating that there never was a horse which could run within two seconds as fast, and without half "cooling him out," started him for a repeat. This mile he timed himself and the watches marked 1:47¼. It "tore him to pieces" completely and though the track was much better when the race with Asteroid came off with the horses "pointed and plated," the fastest heat was 1:48¼.

Mr. Parks bred Papermaker and Joe Howell. The latter has certainly the vouchers to be called a wonderful horse, and Vigilant makes a mistake in only crediting with four wins and $1,350. The *Turf, Field and Farm* gives him eleven wins, in fifteen starts, four times second and $3,180, which is probably correct.

Before Bonnie Scotland was purchased for Belle Meade, General W. H. Jackson, accompanied by John P. Reynolds, visited Atwood Place where we then lived, to see Malcolm. This horse had made one season in Tennessee, and from very few mares he got a fine racehorse in a colt called Nashville. We urgently advised General Jackson to buy the old horse, although we were desirous of selling Malcolm at the same time. Experience Oaks was a fine racemare but she was not the only one of the Scotlands of repute at the time, although of necessity when there was no new crop coming on there must be a vacancy.

Interesting as the tables accompanying the article are we could not find room for them. The first is a tabulated pedigree of Bonnie Scotland, and then there is a list of Queen Mary's twenty-one foals omitted. The four races run in England were thought worthy of reproduction.

The table of winners shows that eighty-one of his sons and daughters ran, thirty-seven of which were winners, the whole amount of money being something over $100,000. The largest winner was the two-year-old George Kinny, $17,800 to his credit, and then Boatman, three years, comes, $10,000. Bootjack, four years, won $9,875, and Glidelia, five, $7,075.

As we have often argued, the amount won is not a fair criterion, as an inferior may win a large stake while the real good one has to struggle for purses. But to get home thirty-seven winners in sixty-one starters is a token of great worth from our point of view, and to have seven winners in eight "aged" starters is good evidence of the capacity to train on. There are several six and five years old in the list, and when it is fully analyzed it is the best commentary on the worth of the horse that Vigilant so graphically portrays :

To write the history of Bonnie Scotland's career is to master the detail of the most extraordinary ups and downs to which the fame of a thoroughbred stallion is subjected by the caprices of fortune. It has been well observed that man is a creature of opportunity, and surely a blood sire is no less so. Of this the history of Bonnie Scotland is a most convincing proof. Born in the purple, he wore it through his career upon the turf; exiled in a strange land, it did not avail him, but, like the late Napoleon, he braved the "slings and arrows of outrageous fortune," and when his opportunity came, after years of neglect and detraction, he rose to the front rank, and left behind him a name which will endure forever in the pages of history.

The pedigree of Bonnie Scotland, indeed, affords a most interesting study for the student of equine genealogy. In it the blood of Eclipse and Herod flows copiously through the purest and choicest channels of Whalebone, Buzzard, Orville, and Sir Peter. It is not a little remarkable that, much as the fame of Godolphin is exalted, Bonnie Scotland possesses probably less of it than any other stallion of note, and what portion of it he does possess he derived principally through Sir Peter, of whom he has many crosses, and from whom we get strains of Eclipse, who has a cross of Godolphin, but in Bonnie Scotland Herod preponderates. Indeed it might be said that he out-Herod's Herod and eclipses Eclipse. His crosses of Herod are not only numerous, but their propinquity is greater than those of the average horse. Besides the numerous Sir Peter crosses the latter's sire, Highflyer, occurs frequently, independent of Sir Peter, and if merit in the ancestor establishes, as we think it does, a claim to merit in the progeny, Bonnie Scotland's title is most clear. Highflyer was by far the greatest racer of his day. He was bred by Sir Charles Bunbury in 1774, and sold, as a yearling, to Mr. Richard Tattersall, founder of the great house which, for a hundred years and for four generations, has transacted the leading sales of thoroughbred stock in England without a stigma. On the turf, Highflyer was never beaten, nor did he ever pay forfeit, winning nearly $50,000 in money, and retired sound. His triumphal career on the turf was but the foreshadowing of a possibly greater one in the stud, for in nineteen years he sired no less than 470 winners of £160,407. The late Mr. Rysdyk is said to have amassed a fortune through the stud earnings of his horse, Hambletonian, the great father of trotters, but that Highflyer enriched Mr. Tattersall we have proof in the palatial and embellished manor house which he built at Ely from Highflyer's earnings, and appropriately christened it Highflyer Hall. The great horse died in 1793, and the monument and epitaph raised over his grave have formed the subject of so frequent reference in turf literature that their further mention is unnecessary.

Of the immediate ancestors of Bonnie Scotland perhaps a few words may not be out of place. Iago, his sire, was bred by Colonel Anson, and was a racehorse of merit. His sire, Don John, had won the St. Leger, but he did the next best thing by running second for the same event. As a three-year-old he ran no less than fifteen times, which, in those days, was considered a great deal. Of these he won ten, including the Column, Welcome, Racing, and Grand Duke Michael Stakes, in which latter event he turned the tables upon his St. Leger conqueror, Sir Tatton Sykes. His career was short but quite brilliant, and his reputation for gameness became a proverb after he had made his desperate finish with Poynton at York, where, though one of his sinews had been cut by a hoof hit, he came under the whip with wonderful courage. His head and back are said to have been models of perfection, but he was short and rather high legged, and the first of his get were accused of want of stamina.

Queen Mary, the dam of Bonnie Scotland, will go down in history with Pocahontas as the greatest of English broodmares. She was a bay, bred in 1842 by Mr. Dennis. Like Pocahontas, Canary Bird, Jamaica, and others of the noted broodmares, she did not distinguish herself upon the course, and was sent to the stud at four years old. Below is a list of her produce:

1847—Brown filly Haricot, by Mango or Lanercost.
1848—Bay filly ——— by Mango (died a foal).
1849—Bay filly Braxy, by Moss Trooper.
1850—Bay colt Balrownie, by Annandale.
1851—Bay colt ——— by Fernley. (b. h.)
1852—Bay filly Blooming Heather, by Melbourne.
1853—Bay colt Bonnie Scotland, by Iago.
1854—Bay filly Blink Bonnie, by Melbourne.
1855—Missed to Touchstone.
1856—Brown colt Balnamoon, by Annandale.
1857—Bay filly Bab-at-the-Bowster, by Annandale.
1858—Bay colt Bonnyfield, by West Australian.
1859—Bay filly Bonnie Breastknot, by Voltigeur.
1860—Bay filly Bonnie Bell, by Voltigenr.
1861—Dead filly to Stockwell.
1862—Bay colt Broomielaw, by Stockwell.
1863—Bay colt Bertie, by Newminster.
1864—Bay colt Blinkhoolie, by Rataplan.
1865—Chestnut colt Blankney, by Stockwell.
1866—Bay filly Bertha, by Young Melbourne.
1870—Bay filly by Rapid Rhone.
Barren in 1867, 1868, 1869, and 1871, and died in 1872.

It was on the morning that Faugh-a-Ballagh won the St. Leger, that Mr. Ramsay found himself divided in preference between two yearling fillies, a bay and a brown, which were offered at the Doncaster yearling sales. The last moment decided him in favor of the bay, which he got for 300 guineas, Mr. Gully getting the brown for a hundred more. Had either gentleman been allowed to peep into futurity, he would have wanted both, and yet their careers, though both famous, are widely different. The brown became known as Mendicant, the Oaks winner, and the dam of Beadsman, while the bay, though of no repute on the turf, as Queen Mary, the dam of Blink Bonny, Haricot and Bonnie Scotland, and grandam of Caller Ou, Blair Athol, Breadalbane, Luke Blackburn, Bramble, Fleetwing, and Glidelia, has written her name in indelible letters upon the scroll of fame. Mr. Ramsay's death occurred five years later, and that "last scene" of the turfman's career, the sale of his stud at auction, followed. Haricot was not a promising first-born, and Mr. I'Anson heard the remark in the sale ring, that "some madman has given £20 for her and her foal" (Braxy), and smiled to think he was the man. From some cause I'Anson, however, did not long retain Queen Mary, but sold her and Braxy to go to Scotland, the mare being in foal by Annandale. He kept Haricot, and when he began to send her along, the little brown showed so well that he regretted having parted with her dam. Haricot's form improved, and I'Anson was no longer undetermined, and when the stable had gone into winter quarters, he set out for Scotland to reclaim Queen Mary. It was in the dead of winter when he found her, gaunt, and half-starved, upon a hillside, with Braxy and Balrownie, then a weanling, huddled together, shivering as they sought to shelter themselves from the piercing blasts of the winds. The Scottish owner's stud-book learning, if he had any, had evidently been dissipated by hot whisky, for the mare was in foal to a half-bred horse called Fernely, and if the Racing Calendar circulated in his neighborhood, it is certain that he was not its student, for I'Anson had no trouble in buying the lot for a few hundreds. In the midst of a rigorous Scottish winter he set out for Malton with the three, and it was all he could do to get them there alive. But he did, and the bargain was the beginning of I'Anson's fortunes. Braxy raced with success, and her daughter, Bernice, by Stockwell, now at Mr. Belmont's, has given our turf many serviceable racers, while Balrownie furnished into a grand horse, and was imported to this country, where he got Climax, Fleetwing, Capt. Moore, Jubal, Heatherbell, the dam of Viator, and many others of note. Queen Mary threw seventeen foals, all more or less racers of eminence. Unless it be her great rival, Pocahontas, she was, indeed, the greatest broodmare of modern times. The glories of Penelope and Web, of the Alexander mare, who foaled Selim, Castral, Rubens, and Bronze, sink into comparative insignificance beside hers. The list of her foals given above is not the extent of her renown; Haricot, her first-born, became the dam of Caller Ou, who won the St. Leger of 1861, and upwards of thirty other events at all distances, and of Lady Langdon, who threw Hampton, a racer of the real sterling sort, and one of the best of the young English stallions of to-day. Balrownie's blood has been of great value in this country in Fleetwing, Climax, Viator, Capt. Moore, and West Roxbury. Blooming Heather was the dam of Laburnum, Blink Bonny won the Derby and Oaks, and threw Blair Athol and Breadalbane, and Bonny Bell foaled Beauclerc, while of Bonnie Scotland it is our effort now to treat.

John Scott's dream that Queen Mary would go to Bay Middleton, and throw a Derby winner, came to naught, as she never honored him with a visit, and I'Anson had almost made up his mind to send her back to Annandale in the spring of 1852. Something, however, threw the short-backed Iago in his path. His stock were not quite as clear in their wind as he liked, but his fine temper and splendid back and loins were attractive. So the mare was sent to him, and the result was Bonnie Scotland, by long odds the most robust and hearty of the lot. "He had the greatest constitution of the family, and was the most indolent at exercise, that I ever had to do with," was I'Anson's pithy summing up of his character. He was a bit coarse, and certainly gross as a foal, and attained such a size that it was soon found impossible to fit him for his two-year-old engagements, when he had nearly broken his leg. Below is a list of the

Performances of Bonnie Scotland, 1856.

July 10.—Liverpool St. Leger for three-year-olds: 10 sovereigns each; 100 sovereigns added; 50 sovereigns to second; winner to pay 15 sovereigns toward expenses; one mile and three-quarters; 23 subscribers.

W. I'Anson's b c Bonnie Scotland by Iago..... 1
J. Dawson's b c Omer Pasha..... 2
Mr. Saxon's br g Tom Thumb..... 3

Mr. Gulliver's Illuminator and Lord Glasgow's Miss Whip colt also ran. Won by two lengths.

York, Aug. 22.—The Great Yorkshire Stakes for three-year-olds.

Lord Derby's b c Fazzoletto, by Orlando..... 1
Lord Glasgow's blk c Brother to Bird on the Wing..... 2
E. Parr's b c Stork..... 3
W. I'Anson's b c Bonnie Scotland..... 4

Seven others ran unplaced.

Doncaster, Sept. 17.—The St. Leger, for three-year-olds; 25 sovereigns each; 100 sovereigns to second.

Mr. Nichol's rn c Warlock, by Birdcatcher..... 1
W. I'Anson's b c Bonnie Scotland, by Iago..... 0
Mr. Morris' b c Artillery, by Touchstone..... 0
W. Hill's b c Rogerthorpe, by The Hero..... 4

Mr. Knowles' Merlin, by Birdcatcher, Mr. Bowe's Victoria, Lord Glasgow's Clarissa colt, Admiral Harcourt's Ellington, and Mr. Dunn's Squirs Watt also ran.

Doncaster, Sept. 19.—The Doncaster Stakes, for three-year-olds; 10 sovereigns each; 100 sovereigns added; 50 sovereigns to second, one mile and a half; 93 subscribers.

W. I'Anson's b c Bonnie Scotland, by Iago..... 1
H. Brook's ch f Manganese..... 2
Mr. Knowles' br c Aleppo..... 3
Admiral Harcourt's br c Ellington..... 4

Brother to Bird on the Wing and Calphefnia also ran. Won by a length and a half; four lengths between second and third. Bonnie Scotland broke down at the finish of the race.

From the above record, compared with that of his contemporaries, we have an idea that Bonnie Scotland was quite the best three-year-old of his year. Ellington and Warlock were the Derby and Leger heroes of that year, but Bonnie Scotland beat the former, and Warlock, who finished in front of him in the Leger, was delicate, and a difficult one to train at best. As a matter of fact, Bonnie Scotland never was thoroughly right in the leg which he had nearly broken the year before, and it could not be made to stand another preparation after his break-down in the Doncaster Stakes, and as it was against his breeding policy to keep a stallion, I'Anson sold the colt to Capt. Cornish for exportation, and he arrived in New York on the ship Baltic during the season of 1857. He arrived in the midst of a great financial panic, and for some time went begging for a purchaser. Mr. John Reber of Lancaster, O., however, was in quest of such a horse to fill Monarch's shoes, and purchased him for $1,200, in conjunction with Mr. Kntz, and Bonnie made his debut in the stud in 1858. His maiden alliance may be said to have been the invincible Fashion, and the result of the union was Dangerous, a horse that Mr. Reber is of the opinion was one of the best he ever trained. Scotland, ont of Young Fashion, was another of his first good ones, who signalized himself by beating Asteroid a heat, being the only horse to achieve that distinction. Bonnie Scotland remained at Lancaster until 1867. The year previous Mr. Kutz had sold his interest to thr. E. A. Smith, and the following year Mr. Smith divided Me stock with Mr. Reber, the old stallion and his daughter Ontario falling to Mr. Smith. This mare, Ontario, was a daughter of Lady Lancaster, by imported Monarch, and, unless it be Glidelia, she was the best of his daughters. For two seasons she swept the board in the West, and has since foaled the rasping horse McWhirter, and is now at Rancocas, one of the most valued of the array of noted mares which dot its pastures. In 1867 Mr. Smith sent Bonnie Scotland to Kentucky, and he made that season, and also 1868, in the Blue Grass region. At the end of the latter season Mr. Joseph Cairn Simpson, now editor of the California Breeder and Sportsman, bought him, trading a farm in Iowa, the horse being valued at $6,000, but soon after sold a half interest to D. A. Gage of Chicago, and finally his remaining interest to Mr. C. C. Parks of Waukeegan, for $1,700. Mr. Parks then purchased Mr. Gage's interest, and the old horse was placed at the head of the Glen Flora Stud, at Waukeegan, Ill.

We have traced the eventful history of Bonnie Scotland up to 1872, and now the ill-fortune which had seemed to follow him throughout his career took a turn. Vandal had died that April, and Jack Malone threatened to follow him soon. Gen. Harding's thoughts naturally turned towards securing a successor to the premiership of Belle Meade. This time he wanted an outcross for his young Vandal, Brown Dick and Jack Malone mares. Leamington was the horse he pined for, but Enquirer and Longfellow had given the brown an enormous prestige, and his price put him out of reach. King Ernest was bred to his taste, but Mr. Withers was not disposed to sell. At last, they made overtures for Bonnie Scotland. Experience Oaks was his only representative of any account upon the turf at the time, and the old horse was nineteen years old, but his get had shown racing quality of sufficiently high stamp to suit, and, as Mr. Parks was about breaking up his stud, after some correspondence Gen. Jackson struck a bargain at $2,500, and it was the best Belle Meade ever made. The old horse arrived at

Nashville, and was shown before a not over-enthusiastic audience. It was beld that he had "had feet," and he "wanted quality," and his "get didn't like a distance." The Hardings, however, bore it in good part. They took off his shoes, let his feet grow out, and the old horse made his first season at Belle Meade in 1873. Among the first of his get were Belle of the Meade and Bushwhacker, the former one of the best two-year-olds of her year, and the latter destined as a four-miler to win a Bowie and Great Long Island Stakes. Bonnie Scotland stood seven seasons at Belle Meade, during which time he rose to the front rank of stallions.

His highest-priced colt, in 1875, was Blue Gown; in 1876, Baritone (Bramble selling for $450); 1877, Boardman; in 1878, Luke Blackburn; in 1879, Banter (Barrett bringing $825); in 1880, Burnham; in 1881, Joe Blackburn (Bolero bringing $5,000).

For the first time since he has risen to importance among the winning sires, Bonnie Scotland has a two-year-old leader to his team, and a right worthy one, in George Kinney, who is the best two-year-old performer he has ever given the turf, and, unless it be the incomparable Sensation, we doubt if we have ever had a better two-year-old. Kinney, in his races, showed indications of a temper, which threatened mischief, and no one who saw his finish for the July Stakes at Monmouth can forget it as one of the most remarkable exhibitions of willfulness and speed which modern race-goers have witnessed. He was on the inside of the track, but swerved clean to the outside rail, then in again, and finally back into the middle of the track, and won. Our opinion of the colt is that, unless something wholly unforeseen happens, he will prove the best colt Bonnie Scotland ever sired, and that is saying a great deal for a stallion to whom Bramble, Glidelia and Luke Blackburn claim paternity. It will be held as rank heresy by the former followers of Luke Blackburn, but Kinney goes into his three-year-old season with far better credentials than Blackburn. Moreover, he is a horse of greater size and length, and quite as substantial, while his breeding is quite as good, he having our friend, Mr. Charles W. Batbgate's, favorite cross of American Eclipse, and traces through to Col. Delancy's imported Cub Mare, to which so many of our best pedigrees run. Our admiration for Pizarro knows no bounds, and Kinglike's Nursery stamped him as a colt of great speed; but, if we were called upon to choose a three-year-old for a hard campaign in the best company, we would choose Kinney in preference to any half-dozen of the two-year-olds we saw run last season. He had a splint when a yearling, which caused George Rice to refuse bim, an act he has never ceased to regret. When Rose sent him along as a yearling he fell lame, and the worst fears were entertained, but we saw nothing last season to warrant the belief that his legs would give him any trouble. His physique is a marvel of strength, and his energy amazing, and these are the attributes which distinguished his relative, Luke Blackburn.

Boatman, who occupies second place in the list, though a good average gelding, is nothing more, and owes his position to the fact that the three-year-olds were not a good lot, and the best of them were broken down or not engaged when he won. That such an animal should win the Sequel, Kenner and Great American Stallion Stakes is sufficient proof of the merits of last season's three-year-olds. Probably Forester or Runnymede could have given him twenty pounds and beaten him, and certainly Macduff could.

Bootjack holds third place, and richly deserves it. He is the Bonnie Scotland of Bonnie Scotlands in all the family name implies of campaigning qualities, having in three consecutive seasons run a total of seventy races, winning forty and $25,162 50. Last season he led the Bonnie Scotland phalanx, and is quite a worthy successor to Bramble in earning a name for toughness. Below a mile and a quarter Bootjack's speed is second only to that of Giroffe and Barrett, but, grand little horse though he is, the Dwyers found for once in their lives that they had misplaced him when they put him in the company of the fastest four-year-olds on the continent. Bootjack's place is at the head of the second class and in handicaps, as he seems to handle weight very well, and is just the style of horse to suit his owners, the Messrs. Dwyer, being one of the every-day kind, easy to train and easily placed.

Glidelia, whose star seemed to have set with her three-year-old labors, shone forth with its wonted brilliancy last season at five, and the finish of her career, at Saratoga, was well worthy of a mare who will go down in history beside Black Maria, Fashion, Idlewild and Ruthless as one of the best turf heroines who have carried silk. We have always had a notion that Glidelia would have excelled over the cup courses had Captain Connor thought best to have her specially prepared. She had all the constitutional qualities of the Bonnie Scotlands, with more quality than falls to the lot of most of them. Like most stayers, she was of a sluggish nature, and required riding to get her to fully extend herself, when her stride was a marvel of power and elasticity. In the Hunter Stakes of 1880 Giroffe caught her in the stretch, and Tom Sayers had to apply the whalebone lustily to bring her through.

"Why, Tom," we remarked to bim in the weighing-room, "the mare can't be herself."

"How's that?" he asked.

"Why, at the distance she always outclassed Giroffe, who isn't quite herself to-day, and yet you had to ride your mare out to win."

"Oh, you don't know the mare, sir," he replied. "She never'll do more than she's asked, and she had begun to loaf along, when all of a sudden I saw Feake's shadow closin' on me. I clucked to her, but she wouldn't budge, although she had plenty left, and so I give her the whip, and she come on with lots in hand."

Of Bonnie Scotland's remaining winners, Ike Bonham may be said to have carried out the promise Lohelia gave years ago for their qualifications as steeplechasers, and, barring Postguard, he is the best representative of the "post and rail" we now have. Barrett is sixth on the list, with nearly as many thousands of money, which, but for his beastly temper, should have been nearly twice as much, as there is a general belief that he is the fastest miler we have had for some time. Bushwhacker's couple of victories were more than enough to compensate for the two years he was an absentee from the post, both races being four-mile heats, viz., the Great Long Island and Bowie Stakes. Brambaletta's name appears for the last time, the little brown heroine having bid adieu to the scenes upon which she has enacted so brilliant a part, and but for the untimely accident at Saratoga she might have left a record similar to Caller Ou, whom she greatly resembles. Bernardine, too, another of the true Bonnie Scotland line of campaigners, has left us, cut off short in life, and Dan K., who improved with years, has about run his last. Apart from George Kinney, the last of the Bonnie Scotlands were not particularly distinguished last season for their two-year-old races. Bondholder certainly created a good impression at Louisville in the spring, but lost form, and Bocaccio, though an elegant model of the lusty kind, seemed to have the slows, but after all the family were never ideal two-year-olds, though several of them have won a great name, and there is perhaps one or two of them who, Luke Blackburn-like, will come out from behind the cloud that obscured their two-year-old efforts, and shine out with all the brightness of Blackburn, Bramble and Glidelia in the battles for the Belmont, Kentucky Derby and Lorillard of the coming year.

Bonnie Scotland died at Belle Meade, Feb. 1, 1880, aged twenty-seven years, or two years more than Lexington or Leamington, seven years more than Australian, and five more than Vandal. Compared with some of the noted patriarchs of the English turf he fairly held his own. Tonchstone lived until thirty, Birdcatcher until twenty-seven, Newminster until twenty, and Stockwell until twenty-one. There is no telling how much longer he might have stretched out his span of life, as, physically, he was quite himself up to a few days prior to his death, which was not in the least due to infirmity but to spasmodic colic. The loss of his teeth rendered him unable to masticate his food, owing to which indigestion set in and produced colic. Even then his grand constitution caused them to hope he would rally through, but spasms set in, and the spirit of St. Leger second went out with the last gleam of that February sun. His skeleton was articulated and placed in the Vanderbilt University, but no such recourse was needed to keep alive his fame. A racehorse of the purest type, an accident had prevented the fullest display of his prowess; ordained by nature to reproduce his own excellence in a progeny, he had long been denied the opportunity. But this he had outlived. He had come to Belle Meade unhonored and in seven short years he had recovered his ground and made a name which some stallions have required a lifetime to achieve. He had, in his neglect, seen Lexington, Australian, Leamington, Vandal, Eclipse and Glenelg flourish, but he had lived at last to see them all give place to him in the list of "winning stallions," and died upon the threshold of "Bonnie Scotland's year," for such 1880 will be remembered. Bramble had won him glory in the cups, Bushwhacker at four-mile heats, and Blackburn and Glidelia were soon to burst upon the scene. In our judgment the blood of Bonnie Scotland will prove one of the most valuable we have in forming the pedigree of the coming racer. It carries with it a diploma for soundness of limbs and strength of constitution such as no other family, either here or in England, possesses, and as the modern system of racing is one of extreme severity, a drop of the old hero of Belle Meade will be needed to give those campaigning qualities for which his children stand quite alone. His daughters are becoming very valuable as broodmares, and already several of them have made a name for themselves. Ontario has bred McWhirter; Kelpie has bred Janet and Duke of Montrose; Bonnie May has thrown Blue Lodge and Bellona; Lucy May has thrown Victim; and Bonnie Kate has bred Bonnie Lizzie. As yet, his sons have not distinguished themselves at the stud, but with Bramble and Luke Blackburn at Belle Meade the male line of Queen Mary's son is certain to stretch out for many generations.

The Next English Derby.

Asmodeus in the London *Standard* thus describes some of the cracks that are expected to face the starter on next Derby day:

As I have already stated the two-year-olds comprised a lot of very good animals, notably Macheath, whose achievements between the time of his debut in the Hurstbourne at Stockbridge, and his defeat during the Houghton week in a single-handed set-to with Adriana, were of the first order. By Macaroni—Heatherbell, Macheath can claim to be a wonderfully well-bred horse, and that his performances have been well worthy of the grand blood which flows through his veins is patent from the circumstance of his having accredited Mr. Crawfurd with upwards of £10,000 in stakes. He was bred and trained by Alec Taylor at Manton, and I believe I am right in adding that the gentleman whose colors he has so creditably carried is only half owner of the colt. Taylor still retains a half share in him. But for one drawback it would be absurd to describe Macheath as other than a grand colt, but, unfortunately for his future prospects, there is a big "if," the fact being that, though almost perfection in every other respect, he stands upon a pair of very suspicious forelegs. It is really a matter of surprise that he should have stood so soundly as he did. A course less adapted for the Manton colt could hardly be found than that over which the Derby is contested, and bearing in mind his faulty performance when Beau Brummel beat him in the Hopeful, I cannot recommend his chance for the highest honors within reach of a racing man, fully believing that the long descent to Tattenham Corner will prove fatal to his chance even if he is able to get to the post, which is doubtful.

A no less charming colt to look at is Beau Brummel, whose general good looks are not depreciated by any doubts as to his legs, which are clean and well formed, and look as strong as bars of iron. When a yearling Beau Brummel was sold to Matthew Dawson, acting for Lord Hastings, at Cobham for 379 guineas, and he made his first appearance in public at Chester, where, as the colt by George Frederick—Ma Belle, he ought, notwithstanding his somewhat backward condition, to have won the Mostyn Stakes easily enough from his stable companion, Camilla, and Madrid. This was proved clearly enough upon the occasion of his next effort at Epsom, when he won the Woodcot Stakes after a good race with Hauteur, and in gauging his prospects of classic honors next May it should always be kept in mind how he bowled down the hill like a cricket ball. There was an excuse for his defeat by the colt by Cremorne—Hetty, in the Mottesfont at Stockbridge, and it may be that he was a little lucky to win the Hopeful from Macheath. Still, though defeated in his final attempt in the Rous Memorial, he was far from disgraced, and really his credentials are such as must give him a splendid chance for the Derby. I may add, also, that he is wintering well, and will, at least so far as looks are concerned, take a lot of beating next year.

A stable companion of Lord Hastings' shapely son of Ma Belle is Galliard, a colt by Galopin—Mavis, remarkable for his singular beauty and symmetry. In some measure he resembles his sire, and to look him over there really does not seem room to find a fault with him. Still, he has never given his trainer the idea of being a real smasher in a private trial, and his public running has not been of a kind altogether satisfactory. He was only a half-trained horse when he won the Chesterfield Stakes at the July meeting at Newmarket, in which his most troublesome opponents were Export, a backward colt, and Padlock. There was not much in his form to exalt Galliard to the top of the tree, but the style of his success was such as to justify a high opinion of his merits as a racehorse. The moment he passed the post he was generally voted a "flyer," but still the stable connection maintained that he was not of the first class, and supposing that he was none the worse for an intervening indisposition, Galliard may really be put down as a moderate only, for there was little merit in his Prince of Wales' Stakes victory at York, and when he met the cracks of the season at Doncaster in the Champagne Stakes he came off in anything but "shining" form. It is true that he had been amiss coughing, but even this would hardly have accounted for his wretched form. Thus it will be gathered, that, so far as concerns the stable companions, my leaning would be towards Beau Brummel, despite the good looks of Lord Falmouth's colt.

Mr. Crawfurd has a strong team, independent of Macheath, to represent him next year, and whether it be Energy, Clairvaux or Keir that will carry the scarlet jacket in the Derby, he will surely be a good favorite. The last-named is a son of Sterling and Wild Duchess, and though not a very handsome colt he showed by his running with Highland Chief that he is possessed of more than average merit, and, moreover, proved his ability to get over a distance. Keir was in receipt of six pounds from Lord Ellesmere's colt and would probably have beaten him at even weights. Energy is another of Sterling's sons from Cherry Duchess, and he is a much more taking colt to the eye than his stable companion, being a remarkably good-looking colt with great power and showing grand quality. Energy made a winning debut at Doncaster, where he made an example of two fair performers in Tyndrum and Bon Jour at a difference of ten pounds. He ran well in the Middle Park Plate, which Mr. Crawfurd won with Macheath, and when he got home gallantly from Tristan and Scobell in the Great Challenge Stakes it really looked as though he was a very smart colt that was "coming on." Though a warm favorite, however, he failed to make much show in the Dewhurst Plate, and, in fact, his performance in that particular race was suggestive of speed rather than stamina being his forte. Clairvaux, by Hermit—Devotion, and consequently own brother to St. Marguerite and Thebais, is a grand-looking colt that might develop into a really good horse, and if Mr. Crawfurd is destined to win the big Derby with any of his Newmarket-trained animals, I imagine it will be with him.

John Dawson has probably not had such a good horse in his stable since Galopin as Fulmen, who is by Prince Batthyany's crack, out of Lightning. It would be hard to find a grander or more shapely colt than Fulmen, and he may be considered to have been very unlucky so far as his racing career has progressed up to the present. He played hare before hounds with his field in the Maiden Plate at Ascot, when he made his debut, and fairly stretched Macheath's neck in the July Stakes, at Newmarket, and there cannot be the slightest doubt but what he ought to have beaten Highland Chief easily in the Homebred Sweepstakes at the Houghton meeting. I shall he greatly disappointed if Fulmen does not make a downright good horse next year, and should he keep sound and well he will, with a good jockey on his back, very likely achieve a similar grand coup to that which completed his sire's fame in 1875. There has been very little betting upon the big event as yet, but I may mention that when lots are backed against the field, the name of Fulmen is never omitted.

Highland Chief has upon several occasions shown smart form in public, but his conformation does not justify one in estimating his Epsom chances very highly, inasmuch as he is not likely to be suited by the course. Furthermore, there is a doubt as to his wind, for though it is denied that he is a roarer, it is admitted that he "makes a noise." Though not a very good performer, as gauged by the hook records, the Prince, by Balfe, out of Lady Sophie, is not at all unlikely to make a big mark in the future. Throughout his two-year-old career he was little more than a baby as a racehorse, but from all accounts he is growing as well as could possibly be desired, and, in fact, no animal could possibly be wintering more satisfactorily. Since last he was seen in public the Prince has thickened in an extraordinary degree, and there will be few better-looking three-year-olds stripped next season, as he combines great power and substance with quality. His best performance last year was at Sandown Park, when Fordham rode him in the Great Sapling Stakes. He was carrying the tremendous crusher of nine stone twelve pounds then, and but for being perhaps a little too tenderly nursed would have beaten Goldfield, to whom he was conceding nine pounds.

A very nice horse that was probably not seen at his best last season is Sigmopbone, by Young Trumpeter—Eau de Cologne. He is a big, powerful customer, with hind-quarters as strong as a dray-horse, but there is no lumber about him, and despite his great size still shows plenty of quality. He made his debut in the Woodcote Stakes at Epsom, but though a good favorite he cut up badly, and certainly did not seem at home on the course for he did not go down the hill at all well. On the other hand, he showed very smart form both at Goodwood and Stockbridge, where the finish was against collar, winning the Richmond Stakes at the former and the Cup at the latter meeting in a style which stamped him a really good horse. He was dead amiss when he ran for the Rous Memorial at Newmarket, and on returning home to Houghton was so bad that fears were entertained as to his getting over his illness. Happily, however, he weathered the storm satisfactorily, and I hear that he is getting on as well as his best admirers could wish. He is entered for the Derby but, unfortunately for Tom Cannon, he was not nominated for the 2,000 Guineas. Here I may mention that the famous jockey will not remove to Danebury until the spring, and in the meantime the long-disused establishment over which the late John Day presided with such success will be put into thorough repair.

The Original Hiatoga.

A few days ago we received a call from Mr. W. P. Dunlap, of Maquoketa, Ia. Mr. D. was born and raised in Rockingham Co., Va., and, emigrating from that State to Iowa some twenty-five years ago, carried with him the characteristic Old Virginia fondness for a good horse, and also some of the horses as well. Our conversation turning upon Virginia horses and Virginia horsemen, he remarked that his father, Col. J. W. Dunlap, of Rockingham County, at one time owned the original Hiatoga, the sire of the famous Rice's Hiatoga, at one time so very popular in Southeastern Ohio. Col. Dunlap bought the horse in 1835, and Mr. W. P. Dunlap kept him two seasons, and then sold him to Charles Sager, who took him to Ohio, where he died within a year. The old Hiatoga was a coal black, with a long white star in his forehead, and both hind feet white; and nearly all of his get were colored like him, although there was an occasional sorrel colt among them. He was highly prized as a saddle horse, was a fast pacer; and so pure and natural was his pacing gait that Col. Dunlap, in order to show his favorite horse, would sometimes lay down a series of nine flour barrels, a few feet apart, in the road, and ride the horse over them, landing him in a pure pacing gait without an effort. The breeding of Hiatoga is not known; he was a strong, muscular horse, weighing between 1,100 and 1,200 pounds, and evidently came of good stock. Some of his descendants were taken by the Dunlap family to Iowa; and to this day wherever any of his blood is found the pacing gait asserts itself. —*Breeder's Gazette.*

The Breeder and Sportsman, a weekly journal, published at $5 a year, is a very valuable journal to those interested in breeding and sporting intelligence. It issued an extra number on New Year's with a splendid steel engraving [illegible] half the price of the paper.—*East Oregonian.*

Death of Billy Barrett.

This once well-known jockey died at his home at Oceanport, near Monmouth Park, New Jersey, on the 6th inst., of pneumonia. During his career in the saddle he achieved fame through the success of his mounts for the Rancocas stable. He first took employment in Mr. Pierre Lorillard's stable in 1874, the late Billy Brown hiring him as a stable boy. He showed so much skill to ride and handle horses according to orders that in August of the year following he was allowed to put on the "cherry and black" jacket, with which he afterwards became famous. One of his first mounts was on the two-year-olds Durango and Bambino, then stable companions of the now world-famous Parole, who was himself also a two-year-old. In the October following Barrett first rode at Jerome Park, having mounts on Springlet, Cyril and Morris for Mr. Lorillard, and Evelyn Carter for Major Doswell. In 1876 Barrett was made the second jockey for the Rancocas stable, and as such was taken to Louisville in company with Dan Sparling to ride Parole and the other horses sent on that disastrous trip. The stable returned almost immediately to Baltimore, and there Barrett rode his first winning mount on Pera for the "non-winner" three-year-old stakes at a mile, Sparling riding Pera's stable companion, Spirley, into second place. During the summer, Barrett, while not riding many winners, had good practice, wearing, as occasion offered, the colors of several prominent owners. At the October meeting of the American Jockey Club he rode Bombast a winner for the Champagne Stakes. The season of 1877 was Barrett's great year. At the Jerome Park June meeting he rode Bombast a winner for the Withers, Zoo-Zoo for the Maryland, Perfection for the Juvenile and Parole for the Woodburn Stakes, the last named event at two miles and a half, it being the long distance race of the meeting. The Rancocas stable was then in grand form, and honors followed fast. Barrett reaped many of them with Bombast and Zoo-Zoo, his riding of the latter filly for the West End Hotel Stakes in a terrific thunder storm being considered a masterly effort for one so comparatively inexperienced. At Saratoga he rode Parole a winner for the Cup, while with Pique, Lucifer, Fugitive, Lady Salyers, Eugene, N. Robinson, Bombast, Zoo-Zoo, Auburn and other horses, he won a number of races.

Billy was also fairly successful at Jerome Park in the autumn, winning the Maturity Stakes with Parole, but perhaps his greatest triumph was at the October meeting of the Maryland Jockey Club, when on Parole he beat Ten Broeck and Tom Ochiltree for the Special Sweepstakes at two miles and a half, for doing which he received an ovation from the admirers of Parole the like of which had never previously been paid to any rider, and fortunately to none since. For it may be said that it was that race and the honors paid him which spoiled Barrett. He rode all through 1878 for Mr. P. Lorillard with great success, while so anxious were other owners to have him on their horses that he could have had a mount in almost every race for which he could ride the weights. His fixed event honors for the year included the Chesapeake, the Cup, the Central and the Pimlico Stakes at Baltimore, the Fordham and Manhattan handicaps at Jerome, the Jersey Derby at Monmouth Park, the All-Aged, the Doswell, the Kentucky Stakes, and, for the second time, the Cup (with Parole) at Saratoga. The year 1879 was, as a whole, a bad year for Barrett. Mr. Lorillard had sent Parole and the cream of the Rancocas Stable to England, and this fact and Barrett's increasing weight reduced very materially the number of mounts he had. He rode a fair number of winners, however, but with the end of the year he severed his connection with the Rancocas stable and accepted the colors of Messrs. Babcock & Co., which he wore with some success in 1880, winning the Withers at Jerome Park, the Jersey Derby and St. Leger at Monmouth Park and the Seqnel at Saratoga on Ferncliffe, but perhaps Billy's happiest day of the year was at Jerome Park in October, when he again put on the "cherry and black" and rode Parole, the winner of his first race after his return from England, both horse and rider receiving honors second only to those paid them in Baltimore in 1877. With this mount Barrett's carreer on the turf may be said to have ended, for although he was occasionally seen at some of the larger meetings, ill health and increased weight virtually forbade his riding, and although he promised on several occasions to ride—even last summer—he was never able to get down to the weight, and as he had but little inclination to travel he was rarely seen elsewhere than at Monmouth Park, which may be said to have been his home during the last few years, and near which he will no doubt be buried.

Dan Mace.

It is possible that Dan Mace may have begun his career as a trainer with some of the animals landed by Noah after that memorable freshet, which it has remained for a Minnesota man to identify as the one which submerged Atlantis. Whether the Atlantean trotters and tracks were influenced by the wiles of the artful Daniel—not he of the lion's den—in antediluvian times or not, would be another fitting problem for the active intellect of my famous compatriot; but there can be but little doubt but that Dan started in as early as Noah. Having fixed the period of his apprenticeship at such a remote date, consistency requires some explanation of his prolonged sojourn among the equines. Mayhap in ancient times he drove a horse a trifle scant of winning because of an upward and backward glance at some bewilderingly beautiful daughter of a prophet whose prognostications regarding that especial event were thereby falsified. Possibly this irate ancient, in his anger, doomed Daniel to drive forever on and on, forever glancing upward and backward, forever wearing the brilliant sky-blue tint so incongruous with his complexion. Perhaps this is all an idle fancy; but where is the horseman so aged that he can remember the time when Dan Mace did not drive? There is something uncanny about it. Dan must certainly be the wandering Jew among drivers. Another fact strongly supporting this theory is the superlative artfulness with which he plays delicate manipulations with the ribbons in the months of strange horses. How else, save with ages and ages of practice, could he do so smoothly, so easily, with so little effort, what requires such determined effort in others? Certainly this does not come from commanding intellectual power, for has not a great critic pronounced Daniel "a genius in the sulky; an idiot out of it?" Then, again, how often has it been remarked that he does not grow old; and is not his persistent refusal to tell his age another most suspicious corroborative circumstance? In the language of a great poet, slightly modified: "Horses die and men grow old, but Dan drives on forever." He did not appear this year behind any of the fast ones in the circuit, and it is possible he is attempting to obtain a release from the curse that is upon him; but it will do no good. Next season must find him in his old place through the Grand Circuit.—*From "Knights of the Ribbons," in Breeder's Gazette.*

Clingstone.

George Saunders writes from Cleveland that when Clingstone returned to that place at the close of last season's campaign his shoes were removed, and the son of Rysdyk turned loose in a paddock every fine day. This was continued until about two weeks ago, the horse receiving exactly the same care in regard to grooming, etc., as during the trotting season, while his food consisted of six quarts of oats per day, with the usual allowance of bran and hay, and occasionally some fine corn fodder. In the meantime, the swelling in his groin, which weakened him last summer, and caused the loss of speed for which those not in the secrets of the stable were unable to account, did not disappear, and it was decided that Dr. Fair, who had watched the case for months, should perform an operation for permanent relief. This was done, and the result was the removal of a fibrous tumor, weighing a pound and a half, from the groin, and adjoining the spermatic cord. This tumor had been in process of formation for five years, and was the result of improper gelding. Since this operation, Clingstone has improved wonderfully in health and spirits, and is now taking a walk every morning and evening, the attendant having his hands full to restrain "the Demon's" ardor. The story regarding Clingstone's sore throat had no foundation in fact, the horse never having been troubled in that respect. He will soon be given daily jogs in harness, and when the season of 1883 opens, stand prepared to meet any and all competitors.—*Breeder's Gazette.*

Palo Alto Colts in Kentucky Stakes.

In the stakes of the Kentucky Trotting Horse Breeders' Association for foals of 1881, to be trotted at the fall meeting this year the following California colts have been named:

Br f Alta Belle by Electioneer, dam Beautiful Bells.
Br f Morning Glory by Electioneer, dam Marti.
B g Doolittle by Electioneer, dam Lady Dooley.
B c Peyton by Electioneer, dam Miss Peyton.
B c St. Just by Electioneer, dam Fidelia.
B f Chiquita by Electioneer, dam Pearl.
—— Gypsum by Electioneer, dam Gypsy.
B c Alban by Gen. Benton, dam Lady Morgan.
Ch g Wyandotte by Gen. Benton, dam Winona.
B c Edos by Gen. Bentou, dam Sontag Mohawk.

All these colts are also named in the stakes for three-year-olds, to be trotted in 1884, and the Blue Grass Stakes for four-year-olds, to be decided in 1885.

American Nominations for English Races.—Among the entries for the large number of stakes and handicaps which closed on the preceding Tuesday, the London *Calendar* of the 4th publishes those made for events to be run at Newmarket, Epsom and Ascot. The American stables are fairly well represented, although Mr. Lorillard failed to nominate anything for the Newmarket Handicap. Mr. Keene put in Golden Gate for that event. The distance is a mile and a half and it will be run April 11. For the City and Suburban, a mile and a quarter, and the Great Metropolitan, two miles and a quarter, to be run at Epsom on April 17 and 18, Mr. Lorillard nominated Iroquois, Arauza, Sachem and Pinafore for the short race, and Iroquois, Sachem and Pinafore for the long race, while Mr. Keene is represented by Foxhall in the City and Suburban and Golden Gate in the Metropolitan. At Ascot both stables are represented for the Gold Cup, Mr. Keene by last year's winner, Foxhall, and Mr. Lorillard by Iroquois, Sachem and Pinafore. The Lorillard three are also among the nominations for the Alexandra Plate. The Ascot Gold Cup is at two miles and a half and will be run on June 7. The Alexandra Plate is at three miles and will be run for on the last day of the meeting, June 8.

The animals in training in England belonging to Mr. J. R. Keene left William Day's place at Cholderton Lodge on the 20th ult., and are now located at Lordship Farm, Newmarket, under the care of Richard Marsh. The *Sportsman* says: "All the horses are well. Foxhall has been withdrawn from the private sale list, and will be trained again. The young ones are a good-looking lot, but it is doubted if either Don Fulano or Bookmaker will stand training."

W. W. Bair has driven the fastest mile to harness, Maud S, in 2:10½; Dan Mace the fastest mile to wagon, Hopeful, 2:16½; Johnny Murphy the fastest mile with running mate, Yellow Dock, 2:11; Budd Doble the fastest two miles, Monroe Chief, 4:46; Charley Green the fastest mile to saddle, Great Eastern, 2:15¾; and "Knapsack" McCarthy the fastest pacing mile, Little Brown Jug, 2:11¾.

A report has been current that the trotting stallion Rustic had lately died of pneumonia, but P. J. Shafter, his owner, in a letter to the San Rafael *Journal* denies the report, and says that the horse, although just recovering from a congestive chill, is alive and quite well.

Extraordinary Birds.—Last Sunday, Mr. F. A. Adams killed a "red head"—a duck that has never before found its way to this part of the Pacific coast, though found in the Northern and Eastern States in large numbers. It was one of a flock of six that were flying very high toward the south. Mr. Adams gave this rare specimen to Mr. Golcher, who is having it stuffed and properly preserved. A few days ago Mr. Adams brought down a very large canvasback that measured twenty-five inches from the bill to the toes and thirty-four inches from tip to tip across the wings. This bird was not "stretched" in order to make these large proportions—nor is this story stretched either.

Fattening Cattle.—There are about 1,000 head of cattle at Marker brothers' ranch at Big Meadows, which are now being fattened for the San Francisco market. Some 750 of them belong to W. R. Todhunter, and the rest to Marker brothers. They are fed on alfalfa hay, and it takes a good stock to last them any length of time. W. H. Patterson and L. G. Clark are feeding 1,000 head of beef cattle at Surprise valley. Wm. Hudspeth is feed 500 head at the same place. G. W. Raynes will have 400 head ready for the market early in the spring.—*Chico Record.*

In Panamint valley the disease known as "blackleg" is making sad havoc among the cattle. It is believed that 1,000 head have died lately. Cattle of all ages are attacked and death ensues in from six to eight hours. It is claimed that among the best fed stock, kept on the driest ground, where good shelter and access to the best mountain water is provided, there is less fatality.

Game of all kinds is quite plentiful in Lassen county, and an effort is about to be made to put the game law in force and stop the wasteful slaughter as practiced now. This fall three Indians, inside of three weeks, killed 142 deer in the northern part of the county.

BASE BALL.

A Case of Bad Faith.

San Francisco, January 16, 1883.

Editor Breeder and Sportsman: During the early part of December Messrs. Pratt and Morris, representing the Haverly club, sought an interview with the managers of the Olympics and Redingtons. They were invited to the Olympic Club parlors and there made a bona fide agreement to play a series of games, say thirteen, and the schedule of games and all details were arranged without a dissent on the part of the managers. The first game was played between the Haverlys and Olympics on the Sunday before Christmas. The Haverlys were outplayed on every point by the Olympics and at the sixth inning the score was 6 for the Olympics to a cipher for the Haverlys, but owing to darkness the Haverlys by forced playing managed to tie the Olympics on the ninth inning, which made it a draw game. The next game played was on last Sunday between the Haverlys and Redingtons. Again the so-called champion Haverlys were outplayed by the Redingtons and at the end of the game the score stood 7 to 3 against the Haverlys. On Sunday after next the tie game between the Olympics and the Haverlys was to be played off, but here suddenly the Haverlys call a meeting and for some reason, either fear of further defeat or a desire to replenish an empty exchequer, the Haverlys decided to play no more on the Oakland grounds. Messrs. Pratt and Morris both admitted to the managers of the other clubs that the action of their club was ungentlemanly and improper and the reason they give is that they could do nothing with their members and that was final; they would play no more at Oakland. Subsequently Mr. Piercy, of the Recreation Park of this city, interviews the manager of the Olympics and states the Haverlys are now under his control and offers to allow the Haverlys to play the tie game off at Oakland provided they receive the sum of $50, or he would pay the Olympics the same amount if they would play on his grounds in this city. Both offers were refused by the Olympics and it is looked upon as a queer transaction. The Haverlys will not again be allowed to play on the Oakland ground, neither will the managers of the Redingtons or Olympics enter into any contracts in future unless they are certain of at least gentlemanly treatment. Very Truly, D. A. R.

Haverlys vs. Redingtons.

A match game of ball took place at the Olympic Grounds at Oakland Sunday, between the champion Haverlys and the Redington baseball clubs, which resulted in a victory for the latter. Appended is the score:

REDINGTONS.	T.B.	R.	E.	P.O.	A.	HAVERLEYS.	T.B.	R.	E.	P.O.	A.
Arnold, 2b	5	2	0	2	3	Brown, r f	4	1	2	1	1
Incell, p	5	1	0	0	14	Levy, 1 f	4	1	0	1	0
Lawton, c	4	0	0	16	3	Morris, 3b	4	0	2	1	4
Evett, 3b	4	1	0	0	0	Megan, p	4	0	1	1	8
Maran, s s	4	1	0	0	3	F. Carroll, c	4	0	1	10	1
Lewis, c f	4	0	2	0	0	J. Carroll, s s	4	0	0	0	0
Leman, 1b	4	1	0	9	0	Gagus, 2b	4	0	4	5	0
Ambuster, l f	4	1	0	0	0	Pratt, 1b	3	0	6	5	0
Money, r f	4	0	0	0	0	Knowlton, c f	3	1	0	0	0
Totals	38	7	2	27	23	Totals	34	3	16	24	14

Innings	1	2	3	4	5	6	7	8	9	
Redingtons	0	0	0	1	3	2	0	1	0	— 7
Haverlys	0	0	0	0	0	3	0	0		— 3

Wild pitches—Redingtons 1, Haverlys 0. Passed balls—Redingtons 3, Haverlys 6. Time of game—Two hours. Umpire—J. W. Mullen. Scorer—J. Lewis.

On Sunday next the Redingtons will meet the Olympics. Messrs. Denny and Irwin of the Providence Club will play with the latter.

THE KENNEL.

Coursing Challenge.

Editor Breeder and Sportsman: As a certain number of coursing gentlemen in this state claim to have the fastest greyhound in California (which I do not believe), I will match one greyhound against any greyhound in this State, best two in three courses, for $100 or $200, or I will match four greyhouuds against any four greyhounds in California, according to rule, and allow a guard throughout, for $400 a side. I hereby deposit $100 as forfeit in your hands, the balance of money to be put up on signing articles of agreement. The above races to come off in February, 1883. The above challenge to remain open for one week.

The Breeder and Sportsman to be final stakeholder. Come up, gentlemen, or stop expanding your lungs.

J. F. Carroll.

Coursing at Newark.

Last Tuesday week, at Newark, near John Dugan's Hotel, a coursing match was run between John Dugan's bd b Sallie Henry, by Cartwright—Sadie, and J. Egan's Lady Franklin Jr., by Ben Franklin—Maid of Erin. Sallie Henry won the match in two straight heats. The judges were D. W. Berry and John Echeron; C. J. Wilkinson acted as slipper. After the main match runs were had between Santa Claus and Nell Flaherty, Lord Lurgan and Nellie. During a race Santa Claus got his left foreleg badly sprained.

For the Next Field Trial.—Mr. J. H. Brock of Oroville has sent his eight-month-old Laverack bitch, May, to E. Leavesley, to prepare for the next Gilroy Field Trials. May is from the kennel of Judge Gale of Oroville, who possesses the only pure Laverack setters in this State.

Dixon Coursing.—For the coursing match to be held at Dixon on Washington's birthday dogs have been drawn as follows: Lady Gay and Nellie, Peter and Pride of the West, Snip and Fly, Dakota and Benicia Girl, Blue Jacket and Mand, Fleet and Jingler, Nellie and Prince; Blue Masse runs a bye.

A number of enthusiasts living in the vicinity of Red Bluff are trying to get up a coursing club. We hope they will be successful and shall be pleased to have them communicate with us.

The new wire fence to be built, encircling the whole Santa Margarita ranch, over the mountain tops and across deep gorges and canyons, will take about one year to build. When completed, it will be the longest fence in the State—over 75 miles in length.—*San Luis Rey Star.*

THE STABLE.

Three-Quarter Shoes.

The following is from the advance sheets of "Tips and Toe-Weights," and it is necessary to make some explanations. These papers were written as the experiments progressed, and, consequently, there are counter opinions. At first the intention was to rewrite the whole thing, hut on further consideration it was held best to follow the course of experiments, in order that the reader might fully understand the practical results that changed former views. In this way all the stages could he clearly understood and a better understanding obtained. I must acknowledge that I first commenced the use of tips with some misgivings, and though soon convinced that they were hy far better than the ful shoe, so far as the welfare of tbe feet and legs entered into the case, I expected to discover drawhacks in the nse of them for trotting and roadhorses, on account of being detrimenta to the action. Every trial has convinced me that my forehodings had no fonndation, and the use of them for seven years, although the experiments were limited, confirms me in the helief that at least ninety per cent. of trotting horses will go faster witb them than when wearing full shoes. The three-quarter shoe I tried several years ago on the fore foot, and until a few months ago I thought it was an imperative necessity on the hind foot when scalping hoots were used. This has heen obviated by using a different fastening, which will be explained hereafter.

But as regards the effect of weigbt I am in a quandary, and at the present time inclined to think that the ideas expressed in this chapter are wrong. The reasons for this change of helief will be given in the part of the work which treats of toe-weights.

From causes that could not he overcome the publication has heen delayed. It is expected, however, that it will be ready for delivery soon after the first of February.

In a previous article I promised to give the results of experiments with the "three-quarter shoe," and the reasons for recommending the use of that kind in nearly all cases on the hind feet, and in occasional instancea on the front feet. The illustration is a copy of one of a pair of shoes made after a pattern sent to William Zartman, Petaluma. The intention was to use it with the toe-weight which Mr. Zartman has patented, and by getting them made at headquarters an assnrance was given that the spur would he properly made, and the shoes snch as were wanted. As the varioua kinds of toe-weights, their uses and ahuses, will form a distinct chapter of the treatise, it is unnecessary to say more at present than that the Petaluma is meritorious, eqnaling the best in nearly every respect. The objects in using ahoea of that pattern on the forefeet were in the first place to remedy a faulty method of picking up the foot, to see if it allowed the proper elasticity at the heel, and shonld it be proven that tips could not he used on streets and roada like those of Oakland, it might take the place of them, obviating the greatest drawback of the full ahoe. The experiments were satisfactory on all these points. The pecnliarity in action consisted of the horse lifting the forefoot with a kind of a twist, in which the inner aide was elevated more than the outer, and, on the hypothesis that unequal weight acts in carrying the foot towards the loaded part, it was expected that the defect would he remedied.

Nearly twenty years ago we experimented with a pacing horse, and tested this theory until satisfied of the trnth of it. This was described in "Horse Portraiture" though at that time we had never heard of the application of weight to the horse'a foot in any other method than in the shoe, or the loaded quarter hoot. The pacer was a most inveterate "knee-knocker," and hy making the outside of the shoe very much heavier than the inside, and using a contrivance placed in the "fork," he was cured of the propensity. It is certain, however, that a greater effect is obtained from the weight heing placed higher np than the aole of the foot, though in many instances, the lower application of it will be fouud anfficient. With the first use of toe-weights it was thought that the advantages came from the weight entirely, and heuce horses' legs were ruined hy carrying loads which permanently injured the teudons. Now it ia demonstrated that it is the inequality of distribution which gives the hest effect, and that a 6 oz. weight on a shoe of 10 ozs. is as effectual as 16 ozs. on one which weighs 1¼ lbs. There beiug an entire absence of weight on the inside quarter, that on the outside had a more potent effect. "Side weights" on the fore feet are inadmissihle, as there would be greater danger of injury to the hind legs wheu put on the outside, or the knee and arm if the excrescences were on the inner. The toe-weight can he given an angle in either direction, though there are serious objectiona to usiug it in other than a straight line. Thus we were compelled to aubstitute something akin to the former experieuces, and, as will he noticed in the cut, the heel of the shoe was made wide enough to cover the whole space between the frog and the wall. It was made thin in order tbat the foot might be kept level, as well as permitting the frog to perform its functions. Only one side was fettered and even that free in comparison with the rigid embrace of the full shoe. It is well known that, owing to the thinness of the horn on tbe inner side of the foot, there is a far greater degree of elasticity in that portion, and even if the outer were somewhat hound, much of the injurious result of contraction is obviated. Much stress has been laid on the propriety of restricting the nailing to the anterior part of the wall, and it is certainly a better plan than to drive them further hack. The friction, however, between the wall and the iron soon wears a depression, and this prevents the expansion in a great measnre. With the full shoe the two grooves are nearly equivalent to back nailing, and the posterior part of the wall is held together as though it were locked in a vise. A glance at the engraving will show that the weight of the animal, when thrown on the foot, will have the effect of increasing the expansion of the inner quarter and the delicate mechauism enclosed in the horny covering will have nearly as much room as in the natural state. The frog is employed, and the labor keeps it in health. This has heen the savior of the Goodenough shoe, and has kept it in use notwithstanding the serious defects which mar it. People sneer at the preface to the advertisement, and chuckle over the alliterative phrase, "No frog, no foot; no foot, no horse." But that has heen the redeeming trait, and the inventor is worthy of great credit for insisting on permitting this important organ to do the duty it was intended to perform. Mr. Goodenough came very near adopting tbe right method, and had he hattled with the same persistency for a still closer adherence to nature he would have accompliahed more than he has. Perhaps not. In that case he wonld have met with a greater degree of stubhornesa, and the whole rejected, whereas it is ahout the only improvement which has had any favor; it has held its own in the face of ignorant opposition, and opposition which was characterized by acenes which were strangely in contrast with any degree of common sense. In Chicago, eome eight years ago, many of the journeymen hlacksmiths refused to nail them on, and they paraded the streets with banners and mottoes to intimidate their "bosses" from using them.

At that time I had several long conversations with Mr. G., and gave the shoes a trial, heing in the main pleased, though the cutting of the channel so deeply I was opposed to, and endeavored to remedy that hy having the shoes flattened at the heels. Among other things which were discussed, waa the cause of corns, and he very correctly ascribed the origin of them to the pressure of the ordinary shoe. David A. Gage had a fine road horse which was grievously tronbled with them, aud at Mr. Goodenough's suggestion tips were put on him. He went much hetter, but owing to the erroneous method of preparing the foot they had to be given up. Had Mr. Goodenough bad the channel, which he directed to he made for the reception of his shoe, cut only far enough back to receive the tip, allowing the whole of the posterior part of the foot to rest on the ground as well as the frog, there would have heen hut little variation from the treatment recommended in these papers. It is rather surprising that he did not come to the conclusion, and that if there were so many benefita to be derived from "frog pressure," there must be analogous advantages following the other natural provisions against the injnries arising from concussion and contraction. The trouhle was that he overrated the beneficial effects of frog pressure, and in estimating that it would make amends for all the evils which follow ahoeing, he did not progress to the ultimate point. His shoe ia a thick one, requiring so deep a cutting away of the horn that the continuity between the wall and sole is weakened, and had it not heen for the jar being so much weakened hy the frog, the animal would bave heen lamed in a hrief period.

Many thiuk that the wall and sole of the horse are tbe same and that the difference in texture is owing to something they never trouhled themselves to discern. Though intimately connected they are entirely different, and maceration will separate them in a short time. It is obvious that when the junction is made so much thinner, especially at the weakest point, injury must arise from the cutting away of the horn of the wall and sole to such a depth as is necessary to imbed a thick shoe so that the ground surface is on a level with the frog. In the instances which Dr. Taliaferro gives, the probahle cause of the soreness was the wearing away of the outer side of tbe foot, until it is something like the channeling which the Goodenough process directs. Finding that auch a large majority of horses wear the outside tho most, without direct examination, the assumption is probahly correct. The gliding motion which ia a peculiarity in the action of the hlood horae, entails greater friction and greater wear, aud the feet having been pared during the time when sboes were worn, the growth of one winter ia not enough to withatand the work of the avmmer. The three-quarter shoe will remedy this, and the heuefits which arise from the whole foot being nnfettered for one-third of the time will enahle the animal to wear thia form of aboe with good results. It is so much hetter than the ordinary kiud that it does not require long arguments to prove the euperiority. The setting must he the same as the tips, the shoulder square where it ends on the inner side of the toe, and the inner side of the foot left flush with the ground surface of the iron.

There are said to he 300 professional gunners residing at Harve de Grace, Md., who make a comfortahle living by ahooting redhead and canvasback ducks.

Saunders' Self-Accuation.

TISKILWA, ILL., Jan. 12, 1883.

EDITOR BREEDER AND SPORTSMAN: In your nnmher for December 30th there appears an editorial criticism on the articles of Geo. Saunders, now heing published hy the *Breeder's Gazette*. From your standpoint and opportunities of knowledge, you are doubtless correct; nay, altogthere right in your argument; but, viewing the matter from my grounnd of observation, there appear reasons for differing hoth with yourself and the *Breeder's Gazette*.

Perhaps yon are well aware that the articles claiming to come from the pens of Peter V. Johnson and Geo. W. Saunders emanated largely from the hrain of Mr. White, turf editor of the Chicago *Tribune* and assistant to Mr. J. H. Sanders of the *Breeder's Gazette*. To he snre, the gentlemen under whose names these articles have appeared furnished the groundwork for the narratives, still such matter as Mr. White called for was furnished him.

Mr. White started out to contrast the lives of two prominent Western drivers; to make the undertaking a success it was necessary to paint one of them in glowing colors, and as the writer deemed it hetter to bring forward this hero first, so P. V. Johnson was trotted ont and all the enthnsiasm, as well as the greater portion of tbe brilliant colors, was placed upon the first effort.

There was nothing in all the list of articles, coming from Mr. Johnson, that did not set forth his greatness; from a careful perusal of them the reader is led to believe that Mr. Johnson is the par excellence of all reinsmen. While I respect the worthy driver of Piedmont and many other good ones, still I am cognizant of some glaring mistakes made by the favorite, as well as a few acts that were not, neither are they, at the present day, above suspicion. Enough of this, however.

Mr. White next turns his attention to Saunders, and proceeds to place him in a very poor light before he has carried the series of papers to a sure heginning.

In the first place, I am surprised that Mr. Saunders should allow himself to he placed before the public in ao conspicuoua a position, and more especially in the glowing wake of the refulgent Peter. It would have heen far hetter had he remained content with the notoriety already gained, for there is such a thing as an unhealthy hath of glory, that injures rather than produces good results; such a haptism aeems to have heen furnished the driver of Clingstone.

The Newburn, not Newhorn, matter was an unfortunate affair from the very first; this horse was one of those malformations or monstrosities that are a curse to any race of auimals and more especially dangerons to the horse kingdom.

Like King Richard, "sent forth before his time" and that too "hut half made up."

The gods smiled at the birth of this hrown colt, hut their facial expressions were not at the form of the new born, hut rather at the havoc he was to work among the children of men.

I well remember when Newhurn was a four-year-old, for at that time Mr. Saunders resided at this place and was engaged in training Ella Earl, King Mambrino and Newburn, at our track and one of the most curions coincidences I know of occurs right here. Newburn is dead, our association is gone where the whangdoodle monrneth, Ella Earl has passed from the turf, King Mambrino has proven a failure as a trotter, but not as a sire, and George— well, George Saunders, has not helped himself very much hy his recent ventilation at the hands of Mr. White. To returu to what I was about to write, I will repeat that I have a vivid recollection of the first trial given the four-year-old colt, Newhurn, when on a hright warm morning Saunders drove him a mile in 2:28. Why ahonldn't I remember it? 'twas soon after the sale of Gov. Sprague, the then wonderful five-year-old, and all of our local horsemen were at fever heat in their excitement over the trial of Newhurn. "Keep the matter a secret and what a picnic we would have when the season opened on the spring following." Keep it we did, for the very next attempt proved how vain are the expectations of man, for our wonder refused to trot at all, and a general disgust succeeded tbe former enthuiasm.

Quarters trotted fast as a bird could fly were the second edition of Newhurn's acts and the mercury of many of our hopea hegin to rise again. In time we learned that Newhurn's speed was a matter of his feet and limhs and had no connection witb the hrain power, for when educated with care the legs wanted to go all the time while the brain had but rare intervals of trotting thought. He was very much like the mule I have read of, and who was noted for his kicking propensities, "sometimea he would and sometimes he wouldn't," so it was with Newburn, only the times when he wouldn't greatly outnumhered the few occasions when he would trot. Saunders may think, especially when Mr. White tells him to, that Newhurn had speed enough at Freeport to have given Kirkwood the go-hy any time or place in the race, hut I don't think so; had the hrown horse received a favorahle send-off without too many scorings aud secured the lead at once, the chances are that he would have won tbe first heat; perhaps distanced every horse in the party. But it is very rare, when the circumstances are as favorahle as I desired them to he, and to a certainty the opposite was the truth at Freeport as well as Prophetstown.

I will admit that Saunders drove all over and about the track at Prophetstown, in order to keep Newburn back, but what were his reasons for such driving? One very good one was that tbe hrown horse was mad, and when he saw fit to put himself in snch a state of miud, he became one of tho most ungoveruable animals that ever looked through a hridlo. What was the result of that spell of insanity? Those who were present remember very well how it terminated. Nowburn was attacked with a severe case of thumpa—so very aevere that it was impossihle to take him to his stall, aud all the remainder of that day and during the night which followed active treatment had to be afforded the sick horse, in order tbat his life might be spared. It would have been hetter had the brute died the very momeut he sank to the ground after that wicked heat, hut the gods were again in their ascendancy, and so spared a worthless life. Newburn was a worthless animal, unfit for the road, unsafe as a farm horse, no earthly account under the saddle, and, as I have remarked, a millstone about the neck of any man that attempted making a trotter out of his unreliable, vicious, headstrong carcass. He was not worth the criticisms Saunders is now receiving and all on his account, and when all such horses as Lizzie Crockett and Newburn are placed where their insanity can work no injury, then will the trotting world have been purged, and the effect will he very beneficial and the time to he hoped for.

I have written more than I intended, and still there is much to he said on the aubject; suffice it to say that I think George Saunders was very indiscreet to place himself in the hands of any man who evinces as little tact as does the turf editor of the *Tribune*. He had better have declined even after the first installment was in, than to have [illegible] poor running that he has.

COL

HERD AND SWINE.

Keeping Butter.

When butter comes from the churn and working table it has a certain flavor to which "the maaket" is a stranger. It may be characterized as a delicate, creamy, buttermilk flavor, in which the ethereal and fugitive sentiment of sweet vernal grass and clover blossoms blend with what in the market is called rosiness, a coarser essence preserved by salt and tickling the palate of grocerymen and the trade. Rosiness is very well in its way, but he who gets butter whose flavor pleasurably titillates the olfactories and mollifies the most sensitive nerves of the most exacting tongue-tip, satisfying the sensitive palate, and, besides, carrying him back dreamily to the sweet-breathed kine and the green pastures, to the thick cream and the plash-churn—must enjoy it within four or five days of the churning.

Such a butter may well sell for a dollar a pound in the town—hot and vile with the odors of humanity and horses, of sewers and street sweeping—but it will not keep. It is like the morning cloud and the early dew. Salt will not save it. The ethereal essence of cream will go, but the rosiness will remain. Salt keeps that.

Well packed butter, if it is good to start with, and is packed in good oak firkins, scalded and brined as every dairyman knows how to do; solidly packed, headed and filled with strong brine, so that every particle of air is excluded, every interstice filled with the brine—such will keep a year, and will be rosy and sweet and marketable; and the butter must be good. Salt will not keep poor butter.

If the cream or milk is wrong—or, to go to the fountain head, if the cows and their feed are not right—the butter will show it. If the churning be overdone, and the working he overdone'or underdone, the butter will be off—off—off. Packing is of little account, unless the butter is made up to the mark as well as the market.

Keeping! Why are we asked to tell how to keep butter; There is very little use for a dairyman who can make good butter to try to keep it. Sent to market it will only keep till buyers find out where it is, and can get and pass it into the customers' hands, after it has paid two or three profits. In any family that we know it will not keep long if it is good enough.

The best butter keeps after this fashion the shortest time, and yet June butter is good in March and May, Oleo will keep, they say, and we should hope it might. He who has poor butter, or oleo, may keep it as long as he pleases; but our readers may rest assured that if their butter is good, and packed after the good old fashion above indicated, there will never be a complaint of its not keeping.

Hogs vs. all Other Stock.

By a careful analysis of the treasury reports it is found that the hog furnished more export material than all the fat cattle, all the dairy products, all the horses, all the mules, all the sheep, and all the poultry and poultry products put together. While the exported hog products for the two years of 1879 and '80 amounted to the great sum of $180,087,726, all the products of all and every other domestic animals and the live animal themselves amounted to only $105,870,382, making about $75,000,000 in favor of the hogs, as against all and every other domestic animal and products from the same that found an export market. Really this shows well for hog raising. How important then is the hog stock to this nation, and to the great Northwest in particular. When we come to think it over we shall find but few farmers whom we have known here in this corn country but who sell and get more for their hogs than for all else combined. The hog multiplies fast and matures quickly. When it is considered how important a factor the hog is in the production of wealth, is it not a little strange that the real scientific knowledge of how to raise them and keep them healthy is so little understood? As seen above, the hog brings more money to this nation from other nations than all other domestic animals put together, and yet there is not a man in America that understands the diseases of the hog, or can cure him when sick. We think here is a field that our agricultural colleges and veterinary doctors had better explore.

There is another thought suggested by these facts: Almost the entire amount of the exported products are raised in the States of Indiana, Illinois, Missouri, Kansas and Iowa. From these five States come the great bulk of hogs that find an export market. We know that Ohio raises a good many hogs, and her Cincinnati was a short time ago the porkopolis of the world, but now Ohio raises but little more than she uses; Cincinuati cuts up but little, if any more hogs than find a market in the south. Eastern Nebraska and southern Wisconsin also send away a few, but the great bulk comes from the States we have named. The center of this pork raising is somewhere on the western bank of the Mississippi river and in Iowa, the first pork State. The point we wish to make is, the extreme folly of shipping all these hogs to Chicago, and then when cut up and packed, send them by rail to New York to find a seaport for shipment to foreign ports, when they could much more economically be cut up on the banks of the Mississippi and Missouri rivers, and, by barges, taken to the sea at a mere nominal cost for freight. But the history of the world is, that mankind loves to be ruled, loves to pay tribute to some king; Chicago is the Western man's king, and to it he loves to pay tribute even if it he a tenth of all he earns. When will every man be his own king?—*Ft. Dodge Messenger.*

A Word for Mutton.—The mutton of a well-fed sheep of every breed, from the Downs and Shires down to the little wooled Saxony, is palatable and healthful. None of the objections urged against the use of pork can be brought against that of mutton. It never has been known to impart scrofula, trichinæ or tapeworms to its consumers. The sheep does not thrive in the mire nor does it consume garbage or vermin, or decaying meats or vegetables. It does not wallow in the trough it feeds from; but it is a dainty and a careful feeder, and as cleanly as needs be in its habits. Mutton is more easily and cheaply produced than beef, is just as nutritious, and may be served in as great a variety of forms. As a steady food it is far superior to poultry and costs no more. We mean good, fat, juicy mutton, not that from the half-starved, scabby or foot-discarded specimens that have outlived their breeding age and been shorn of fleeces enough to furnish shoddy blankets for a tribe of Indians. People in cities seldom know how really good mutton tastes, and the remark may also apply to most families upon the farm. The latter too often fail to try it. We know of many well-to-do farmers, who do not slaughter a sheep during a twelvemonth, yet who kill a pig every month in the summer season and in the fall "put down" pork enough to last every other month during the year. This is a nation of meat eaters, but it confines itself too exclusively to pork and beef. It is better to sandwich in a little more mutton. A few sheep for family consumption, even when they are not kept for sale or for wool, will be found a most excellent investment on all farms. —*L. S. Coffin.*

Butter-Making Hints.

It can never be too deeply impressed that skill and honest work will enable manufacturers to gain fame and a financial reward. Universal as the demand for cheap products seems, there is a class of buyers who are fully aware of the worth of a good thing, and they are willing to pay liberally when fully satisfied as to quality. With regard to butter, more education is needed by both the maker and consumer. The latter must needs know that the highest class of butter can not be produced in competition with the ordinary qualities in price, and also that it must have in his house such care as is needed to keep it from parting with its aroma, only to absorb the odors of damp cellars and unventilated kitchens. Nothing enters a house so pure, healthful and delicate as choice butter, and every year is adding largely to the number of consumers who are aware of its value. With the very best butter oleomargarine and kindred frauds are not serious competitors. Indeed, they are very much the reverse, for they render particular people so suspicious that they are quite ready to pay an extra price where they are assured of purity, as they can only be by dealing with men of character. The fatty oils are now so insidiously mingled with the real article, even on the retired farm, that going to the simple-minded tiller of the soil is not always finding the fountain head.

In some of the steps of production choice butter costs no more than poor. Improved implements are not only labor-saving, but they are great economizers of material. Well-made pans will produce more and better cream, and the improved churns will make the most as well as the best butter. The same rule is still more manifest when applied to cattle and their food. The breeding of domestic animals has been so successful that especial traits are remarkably developed in them, but usually at the sacrifice of other qualities; and he who fails to select his animals with reference to the work in view may he using a fork to eat his soup with. The superb breeds of beef cattle could never have been produced except by surrendering, to a degree, the aim of milk production; and the milk and cream breeds, if made to assume fattening tendencies when in milk, are seen to fail in their proper purpose. This does not mean that beef cattle will not milk well, for they often do; but if at the same time they maintain their full beef form, it is at the cost of unprofitably high feeding, that alone can sustain such nutrition as is needed for the double strain. We do not assume that the cream breeds will not make good beef, for in time the smaller cattle of fine fiber and high flavor will assume in America the place they now hold in England, where the self-indulgent club men demand their cuts from the mountain cattle of Wales or Scotland; but it is assumed that if they are treated and fed for the best results in their class they cannot become the round, sleek beasts that delight the grazier.

In butter items it is quite customary to read that so and so has made choice butter since using the patent double-acting, low-pressure churn, that it is also a good table, or handy as a wash-tub, etc., etc.; or that success is certain if double-refined, anti-monopoly salt is used; or that there is a sure charm in a fancy milk pail or mastodon butter worker with chromo of the inventor. Innumerable certificates attest the superior virtue of "Rising Sun" butter color; and if the "Eureka," "Excelsior," "National," "Ne Plus Ultra," "Utterly Invincible" milk strainer does not answer, the money will be refunded, unless the agent is missing. Perhaps so. But a good workman can use almost any tool; and innumerable good ones are always obtainable.

It is suggested that the amount of land devoted to pasture be limited to the extent that will carry the herd as long as feed is flush; more will not be useful, as, if not fed down early, it will grow rank, dry on the stem, and if cows are forced to consume it, fight flies and go without water, they will hardly pay for driving home to milk. This, unfortunately, is the practice of many valuable farms, as is proved by the advertisements under the herd of "Mortgage Sales." It is here that the intelligent farmer should not hesitate to avail himself of partial soiling, which, in brief, may be carried out by putting his cattle in the barn before the morning milking, and having ready a fresh breakfast of sowed corn, green oats, or any of the many soiling feeds, of which golden millet is the best for butter. A few cheap frames (costing the price of two cigars each, and the cost of a few "treats,") put in mosquito netting, will keep flies out of the building and save the cows an amount of head and tail work that costs feed and lessens product, as do all unnecessary labor, exhaustion or worrying. If possible the cattle should have water in the barn, where very simple arrangements will answer to convey it; and not less than three daily feeds should be given them. After evening milking they should be turned out to get open air, exercise and a bite of cool, dewy grass, free from the teasing of flies, and safe from heat. This, of course, costs something; but it costs more to neglect it. Five or six unprofitable months each year will ruin any industry, and ought to, to keep the proper balance in favor of prudence and intelligence, and secure the non-survival of the unfittest.

The partial soiling system has carried cattle in full flow of milk through drouths, when on adjoining farms there was not milk enough to drink, and there is nothing mysterious, difficult or experimental in the practice, nor is it patented as yet. It seems a very simple mental process to realize that as the vitality of a herd of cattle is to be sustained for all the months of the year, the true and only measure of profit is the excess of production during the milking months over the annual cost of carrying; yet many a dairyman seems to fail in comprehending this fact, and finds himself laboring for his pains year after year, wondering why he has not the good luck of his more prudent and thoughtful neighbors. There is the frequent element of misfortune in all pursuits, but it is not the source of half the misery and failure that lies at the door of the witch of malign influences. Luck is not luck as often as industry, forethought and intelligence are the good fairies that gild rural homes with the keenly appreciated rewards of labor. If farmers will cease to change and chase one kind of agriculture after another—now sheep, now grain, then fat cattle, then cheese, and again butter—and make themselves specialists, fitting their farms and buildings for one pursuit, and mastering the details of that one, they will in most instances command success.

The most noted of the famous dairy farms that have given so wide a fame to Philadelphia butter, are directed entirely to that product, and when the dairy work is well done there is no lost time. After the small amount of cultivation is carried on that is needed to renew meadows—which, by the way, are made as permanent as possible, as are the pastures—all grain feeds are bought, and in buying feeds they practically buy manure, so their farms yield immensely in grass and soiling crops. The cattle on some of these farms are not bred, but are milked farrow as long as stimulating feeds will keep them profitable, and then are in very fine condition for the butcher. This, however, is not an advisable practice, for one of the main sources of a dairyman's profit should be in raising the finest possible calves on sweet skim milk; the hulls for veal, the heifers to renew his herd with high grades, or to meet the rapidly growing demand for family cows of gentle disposition, giving rich milk for many months of each year.—*Cor. Breeder's Gazette.*

The Thermometer in the Dairy.

Butter-making has been reduced to a science. There are rules of working more or less known, which may be employed to uniformly give certain, definite results. More important than any other one thing connected with these rules is a strict regard for temperature. With such regard all the other factors and conditions of success are subject to chance.

Temperature, which is so important, may be determined to necessary certainty only by the aid of mechanical help, such as is afforded in the thermometer. The thermometer may indeed be called the key to scientific butter-making. No other one thing has so much as the thermometer to do with a right process of making butter, or butter-making by rule. In past time, when butter-making was purely a rule-of-thumb process, the value of the thermometer was not known. As intelligent methods began to take the place of hap-hazard ways, the use of the thermometer came to be considered by advanced makers a necessity, and to-day there is no one thing that distinguishes the advanced dairyman from the dairyman of primitive ways, like the regard for temperature, which calls for the use of the instrument which tells the temperature. If it is still true that this useful, simple and cheap instrument is not to be found in one in ten of our dairies, it is equally true that our butter has accordingly low average quality. It has been claimed by good authority in different parts of the country, that not more than ten per cent. of our butter is what it should be for shipping purposes. It is doubtless safe to say that when nineteen out of twenty of our dairy farmers come to believe that they cannot afford to be without a thermometer, the condition of things will be reversed, and ninety instead of ten per cent. of our butter will be of prime quality.—*Canadian Farmer.*

Ayrshire Records.

Ayrshire cows are making for themselves an honorable name and place among the butter-record cows of the country. Herbert Merriam, Weston, Mass., who has for years kept a careful record of the daily weight of milk from each of his cows, in his report for 1881 says that Harriet 2,468 A. R., gave 6,048 pounds; Kirbine Maid 3d 4,449 gave 6,541 pounds; Lady Essex 3d 3,595 gave 6,672 pounds; Kilhirnie Maid 2d 3,581 gave 7,649 pounds; and Lady Rice 5,294, with her first calf, 6,440 pounds.

A. Tubbs, Mexico, N. Y., writes that Dahlia 5th 4,329 gave in June last 1,641¾ pounds milk. James Cloud, of Kennett Square, Pa., writes of a four-year-old cow, name not given, as having given 16 pounds of butter in seven days; of a two-year-old, name not given, which gave 10 pounds of butter in that time; and of the cows Nancy Cornell 4,844 and Phora 5,313 as having given in the month of June last, 1,507 pounds and 2,387 pounds of milk respectively. If breeders of Ayrshires will take care to give full and accurate records of the milk and the butter yields of their cows, with an account of the system of treatment during the time of the test, in the manner adopted by Jersey breeders, they will do much to enlighten the public in regard to the real value of the Ayrshires.

Cheap Meat.—There is nothing that is in greater demaud to-day than cheap meat, especially cheap beef. Cheap bread is within the reach of all, with such a magnificent cereal harvest as we have had for the present year. The price of beef has already fallen three to four dollars in the hundred pounds, in consequence of the sending of dressed beef from Chicago to the Eastern markets. The business promises to take on large proportions, and that very soon. It appears that certain Chicago parties, with abundant capital, began to send dressed beef to New York, which had been slaughtered at Chicago, and for which their agents asked much lower prices than for beef that was slaughtered in New York. The experiment proved so successful that the price began to fall at once. In fact, the Chicago venture made the price. A representative of the Chicago firm, on being interviewed, stated that his firm merely claimed to sell at the market price. That is a good statement, in view of the fact that it makes the price itself. Two other firms are about to begin operations in New York on the same basis, altogether representing a capital of ten million dollars. The result, it is expected, will be to do away entirely with the business of slaughtering cattle at the East. Forty dressed cattle can be transported from the West in a single car, against from thirteen to sixteen head of live cattle, and the shrinkage in weight incidental to the wear and tear of the live animals on the trip is also saved. The hides, tallow, horns and hoofs are worth more in Chicago than here. The movement means cheaper beef to the consumer, though retailers will contrive to keep up the price as long as they can. We are assured that it will be impossible for Western men to sell Western cattle in New York and compete with sellers of beef that has been dressed in Chicago.—*Massachusetts Plowman.*

A party in Philadelphia, using the name of D. W. Lee, concocted a scheme by which he succeeded in swindling several Kentucky breeders, and which will probably give him and his accomplices a term in the State prison. Getting the names of the leading breeders of fine sheep in Kentucky, he seems to have written to all of them about the same time, representing that he was a retired business man, and intended stocking a large farm he owned in Pennsylvania. He gave as reference a jeweler in Philadelphia. The breeders gave prices of stock which Lee agreed to, provided he could get a credit of ninty days. The breeders wrote to the jeweler and duly got answer that all was right. Some of them still doubted the transaction, and demanded cash in advance, but others, among them, as we are informed, Mr. Copeland, Messrs. Waddy and Messrs. Samuels—shipped stock to considerable amounts, after taking still further precautions, and such as are ordinary among business men. When the time for payment came, however, the notes went to protest, and it was only then that the victims realized that they had been swindled. The stock was duly delivered to Lee and freight paid, but that is the last trace of it. It is supposed the Pennsylvania farm was a myth and the jeweler an accomplice. Arrests, we learn, have been made of the leaders in the scheme, and it is the determination of the breeders to push the prosecution.—*Farmers' Home Journal.*

The London *Live Stock Journal* presents an interesting, if not very appetizing picture of the possibilities of oleomargarine, when it quotes a statement that in one year the fat has been extracted from 141 tons of fish and tripe refuse, 13 tons of cats and 7 tons of dogs, and suggests that the fat thus obtained is "just that identical animal oil which suits the purpose best" of makers of oleomargarine.

THE 2:20 LIST.

A Resume of the Standing of the Mambrino Chiefs, Clays, etc.

In the direct male line there are nine Mambrino Chiefs in the 2:20 list, or not quite one-tenth of the whole number. In point of speed Trinket, 2:14, by Princeps, son of Woodford Mambrino, dam Ouida, by Rysdyk's Hambletonian, stands first. Princeps' dam was Primrose, by Alexander's Abdallah; grandam Black Rose (dam of Darkness, 2:27¾), by Tom Teemer, the pacer. Ouida's dam was Morning Glory, by imported Cousternation; grandam by Eutaw. Woodford Mambrino was by Mambrino Chief, dam Woodbine (dam of Wedgewood, 2:19), by Woodford, son of Kosinsko. Woodford Mambrino was a great campaigner, and got a record of 2:21½. He was a great horse, and died before he had reached the limit of his powers. Trinket has a combination of splendid winning strains in her composition. As a campaigner she made no mark, going wrong in the legs early in her career. This, however, was no fault of her breeding. As a four-year-old she trotted in 2:19¾, in 1879, which record stood the best until the past season, Jay-Eye-See trotting in 2:19. As a five-year-old she trotted in 2:19½, cutting her record down to 2:14 in her next season.

Black Cloud, 2:17½, by Ashland Chief, dam the Cluke mare, by Capt. Walker, son of Tecumseh, the pacer. Black Clond, an entire horse and string-halted, is a great campaigner. He started several seasons ago, improving each year, trotting hard races against the best in his class. He is true gaited, very powerful and dead game. The only distinctive trotting strain in Black Cloud is through Mambrino Chief. Ashland Chief's dam—a thoroughbred—was by imported Yorkshire. The pacing element in Black Cloud's composition has had an influence upon his conformation.

Hannis, 2:17¾, by Mambrino Pilot, dam Lady Stewart, the trotting mare, pedigree unknown, was a remarkable campaigner. Hannis and the masterly Gen. Turner were among the great features of the Grand Circuit for some seasons. He was an all-day horse, good for any number of heats in a hard race, and game as a bulldog. Like the generality of enduring horses, Hannis is a medium-sized animal of quick, level action, and a stayer.

Lady Thorne, 2:18½, by Mambrino Chief, dam by Gano, son of American Eclipse, was one of the greatest of campaigners. She was a stout, lasting mare, of fine action and very speedy. It is claimed that she never reached the limit of her speed in public. An accident which permanently disabled her retired this mare when at the height of her fame.

Croxie, 2:19½, by Clark Chief, dam Lady Whitefoot, by Little Priam, son of imported Priam, grandam by Downing's Bay Messenger, was a noted mare. Croxie was a number of seasons before the public, and distinguished herself a sa first-class campaigner.

Keene Jim, 2:19½, by Lookout, dam Laura Fair, by Rattler, son of Stockbridge Chief, is or was a very speedy horse. As a four-year-old Keene Jim got a record of 2.24½. Three years after he reduced his record. He never was campaigned to any extent, but acquitted himself creditably while on the turf. Lookout's dam was Lady Scott, by Woodford, who got the dam of Woodford Mambrino and Wedgewood.

Parana, 2:19½, by Mambrino Hambletonian, dam Belle of Cayuga, by Hambletonian Prince, son of Volunteer, was a great mare of the season of 1880. She was a sure winner that year, beating the best fields. She afterwards got "off," and has not done anything extraordinary since. In breeding she is as good as any, a mare of remarkable inbreeding. Mambrino Hambletonian is by Mambrino Pilot, dam Gondola, by Rysdyk's Hambletonian; grandam by Seely's American Star, a splendid combination of trotting blood. Hambletonian Prince's dam is by the Old Horse, grandam by Americau Star.

Humboldt, 2:20, by Stocking Chief, dam a pacing mare, is a very stout horse, but of eccentric action. He has campaigned several seasons, but has not particularly distinguished himself as a winner.

Mambrino Gift, 2:20, by Mambrino Pilot, dam Waterwitch, by Pilot Jr., was an able horse. He was some years on the turf in the best company. Waterwitch also produced Scotland, 2:22½, by Bonnie Scotland, the thoroughbred.

Mambrino Chief and his descendants represented in the 2:20 list crossed well upon all mares. There are but two in the list out of Hambletonian mares, the rest distributed among the Capt. Walker, Gano, Little Priam, Rattler and Pilot Jr. strains.

Next to the Mambrino Chiefs come the Vermont Black Hawks with seven in the 2:20 list. These, of course, include the get of Ferguson's Grey Eagle, Gen. Knox, Revenge, Daniel Lambert and Viley's Cripple.

First on the list is Charley Ford, 2:16¾, by Ferguson's Grey Eagle, dam not traced. Charley Ford was a great campaigner in his day. He trotted many hard-fought races with able antagonists, and proved himself a stayer. He is a horse of substance and of thorough trotting conformation.

Lady Maud, 2:18½, by Gen. Knox, dam Fanny, by Sabek, son of Logan, was a speedy mare and an improver. She was several seasons on the turf. Gen. Knox is by Vermont Hero, son of Sherman's Black Hawk, dam by Searcher, son of Barney Henry, and has ten of his get in the 2:30 list.

Troubadour, 2:19, by Revenge, son of Napoleon, by Sherman Black Hawk, dam by Busiris, son of American Eclipse. The dam of Troubadour was Illinois Maid, by Black Donald, son of Vermont Hambletonian. To the cover of Revenge Illinois Maid also produced Chicago Maid with a record of 2:25. Troubadour was a very good and speedy horse, while on the turf. Near the close of the season of 1881 he threw out a curb which caused his retirement. He is now said to be recovered and will trot the coming year.

Comee, 2:19½, by Daniel Lambert, dam by Hiawatha, was a first-rate campaigner. His breeding on the dam's side is obscure. What trot he gets is through his sire. Daniel Lambert is the best entire son of Ethau Allen (2.25½), dam Old Abdallah, grandam by Stockholm's American Star, the sire of Seely's American Star. Daniel Lambert has twenty-two of his get in the 2.30 list.

Camors, 2:19¾, by General Knox, dam untraced, was an able horse. He has thirty-five heats in 2:30 or better to his credit.

Belle Brasfield, 2:20, by Viley's Cripple, son of Ward's Flying Cloud, dam Sally Chorister, by Mambrino Chorister, son of Mambrino Chief, was a distinguished trotter. She was game, stout and speedy. Sally Chorister also produced Proteine, 2:18, to the cover of Blackwood, by Alexander's Norman.

Capt. Emmous, 2:20, by Continental, son of Bacon's Ethan Allen, dam by Stuhtail, was a good horse in his day. He campaigned a number of seasons with credit to himself. He is of fine trotting conformation, and was very speedy. Stubtail got the dams of Buzz, Rufus, Wizz, Elmore Everett, Kitty, Lew Ives, and Proctor.

The Vermont Black Hawk blood represented in the list has nicked with several crosses, but, with the exception of Charley Ford, none of their descendants proved a great campaigner.

The Clays are represented by five members, first of which is Hopeful, 2:14¾, by Godfrey's Patchen, son of George M. Patchen, dam by the Bridgham Horse, of Messenger descent. Hopeful and Dan Mace are synonymous. The little gray gelding has trotted on all the principal tracks of the country in the best of company, year in and year out. He was a horse of great courage, true-gaited and speedy. He drew a wagon a mile in 2:16½, the best on record.

American Girl, 2:16½, by Amos' C. M. Clay, dam not traced, was a great mare some years ago. She trotted all over the country, winning many hard-contested races against such as Lucy, Lucille Golddust, Pilot Temple, Goldsmith Maid, Rosalind, and George Palmer. She has 150 heats to her credit.

Lucy, 2:18½, by George M. Patchen, dam by May Day, was another of the same sort. She was stout and game.

J. B. Thomas, 2:18¾, by Sterling, son of Patchen Boy, dam by Defiance, made his mark in 1881. He is speedy, and a good horse in his class.

Alexander, 2:19, by Ben Patchen, son of Burlington, by George M. Patchen, dam by Canada Jack, is a notable animal. He proved himself able to go on. His victory over a formidable field for the $10,000 purse at Rochester, July 4, 1881, is fresh in the mind of the reader. It took seven heats to decide the race, and every one was fought out.

The five members enumerated get nothing from their dams in the way of trotting speed, with the possible exceptions of Hopeful and Alexander. Clay mares crossed principally with Hambletonian sires have done more for the 2:20 list than the male line, St. Julien being the best specimen of this combination.

Fifth in order is Alexander's Norman, with three representatives, Lulu, 2:15, by Norman, dam Kate Crockett, by imported Hooton, standing first. As a campaigner Lulu was not greatly distinguished. She was of very excitable temperament, mix-gaited, but very speedy in streaks, like many others of similar breeding.

Proteine, 2:18, by Blackwood, dam Sally Chorister, by Mambrino Chorister, was a campaigner. She has a strain of the stout Mambrino Chief blood through the dam of Blackwood as well as her own dam, and it made her speedy, resolute, and enduring.

May Queen, 2:20, by Alexander's Norman, dam Jenny, by Crockett's Arabian, was fast, but never did anything remarkable. The balance of the list is made up by Blanco, Golddust, Blue Bull, Toronto Chief, etc. Smuggler, 2:15½, by Blanco, son of Iron's Cadmus, dam of pacing origin, was the most remarkable of the trotting stallions, with no trotting strains in his organization. In conformation he is a pacer. He was a great horse on the turf, stout, dead game, and fast. His speed was secured, however, by artificial appliances, like Legal Tender, Minnie R, and others. He will never race again, but when at his best was a wonder.—*New York Sportsman.*

Mr. W. G. George, the English athlete who, with his friend, William H. Caldicott, sailed for England on December 13, arrived in England on December 22, and has been giving the reporters of the English papers his opinion of his stay in this country. He expressed himself pleased with the American people with whom he came in contact while here. He is quoted as saying that he thought the Americans loved fair play, and that the little trouble arising out of the decision of those having in charge his races with Myers, whereby Myers was obliged to forfeit the decided race of the national series, was not as great as was at first reported; he said that Myers is a gentleman and a great runner at any distance up to 1,000 yards. Of Delaney, who defeated him in the ten-mile race on December 12 at the Madison Square Garden, George said that he was a good runner, though it was his belief that had he been in better condition he would have won that race also.

BILLIARDS.

It is said that Vignaux is coming to America to play a certain kind of game—the champion's game with the extended liue. This looks very much as though the affair was cut and dried for one or two players, but some of the others may kick over the traces, and refuse to play in a tournament, which practically handicaps them out of it. The tourney, if it ever comes to a head, should be framed to give the Americans a chance, and one of the recognized games, cushion caroms, straight rail, or corner barred, would be the proper thing to play. There is no need of any innovation, as any such proceeding as this would throw the smaller players entirely out of gear. The Frenchman could have no objection to anything but cushion caroms, but at least six players will set their faces against any new feature which means a lot of practice at a game that one or two of the contestants had had one or two months' more practice than the balance of the entries. This is a thing that the promoters of these tournaments will do well to study over, or the American public may incline to the belief that the Gaul has been given an undue advantage over such experts as Sexton, Schaefer, etc. The excuse that one man took time by the forelock will not avail, as the general public, and the majority of the players, for that matter, have had no official notification that any tournaments are contemplated, and no one wants to put in two or three months' practice with the slim possibility that there may be a tournament in the near future. Mons. Vignaux has not acted in such a manner toward American players when they went across the ocean to do battle with him that he should be treated to special legislation in regard to an international billiard contest. His treatment of Sexton, Slosson and Schaefer is still fresh in the minds of those who read and think, and any negotiation tending to retard the Americans is very apt to draw out an indignant remonstrance from the residents of the United States. If the Frenchman will not come here unless he has the best of the affair, then he had better be left in La Belle France, where he is sure to have fifty per cent. the best of any match he may make with a foreigner.—*N. Y. Sportsman.*

One of the longest, if not the longest, billiard matches on record was played at Ottawa on the 19th ult., between Mr. Grant Powell and Mr. Washington. They commenced lifepool at 7 p. m. on Monday, and continued without cessation until 7 o'clock on Tuesday morning. They immediately began a match game of billiards which lasted thirteen hours, during which time neither tasted food. Powell scored one more game than his opponent.

On dit, that at her castle in Wales, Adelina Patti, prima donna, has probably as handsome a private billiard-room as can be met with anywhere, and when she and Nicolini go caroming, there is in the same room a $20,000 orchestrion, to whose heavy harmonic strains the clicking of the ivories furnishes a pleasing melody.

Joseph Vermeulen, the Chigago expert, wants to play anyone west of that city.

DALY AND SEXTON.

The Most Brilliant Billiard Game Ever Played in New York.

Maurice Daly and William Sexton met at Tammany Hall, New York, on Saturday evening, the 6th inst., to play the second of the series of cushion carom games. In the first, played December 1st, Sexton was victorious, the score standing Sexton 500, Daly 456. In this second game Daly showed his old form and the play of both contestants was the finest ever seen in New York, the average of both men being better than the record. The game was 500 points up and the stake $1,000. Budd Scofield was referee and marker, John Reeves was umpire for Daly and Al Sauer was umpire for Sexton. The lead was won by Daly, who took the white ball and played the opening shot, which counted as did six others before he retired, and Sexton made his opening shot, which netted him a goose-egg. Daly then made one point and missed, as did Sexton. Thus early in the game the admirers of Daly saw that their favorite was back to his old form, and the odds, which before the opening of the game were 25 to 20, changed to even money; a large amount of money was placed at those figures. Daly, who was handling the cue with his old-time skill, kept rolling up singles until the fifth inning, when he scored 13 without a break, one of them being a delicate bank-shot, which drew forth loud applause. Sexton did not make double figures until his ninth inning, when he made 10 points. In his next inning Sexton made a brilliant six-cushion shot, but missed the next, an easy one-cushion carom. In his part of the eleventh inning Daly made a run of 44, four of which were long-banks. In this run, Daly's position play was a "masterpiece of the art," as a spectator put it. Sexton's twelfth inning netted him 11, two of that number being difficult four-cushion caroms. In his thirteenth inning Daly scored his first 100 points, having made an average of 7 9-12 and having run that number in 37 minutes. Sexton did not turn his first hundred until 1h. and 4m., his average being 4 1-6. Five times in the first twenty-five innings did Daly make double figures, Sexton making the same number of doubles, but for a smaller aggregate. In the twenty-sixth inning Sexton made a run of 30 points and was loudly applauded several times through the break. In the twenty-eighth inning Budd Scofield, in answer to a voice, called the game—Daly 157; Sexton 137. In the thirty-sixth inning Daly made a two-cushion draw to the corner, and was liberally applauded. In his thirty-sixth inning Sexton made a carom to the corner, the reverse English causing the ball to roll to the side rail, along which it ran for two cushions, making a "scratch," at which half the audience laughed and the other half cheered; Sexton gave a quiet smile and missed the next shot. At his fortieth inning Daly made a magnificent run of 38, most of them by close rail nursing and brilliant position plays. At the end of one hour and forty minutes Budd Scofield announced—Daly 214; Sexton 178. In his forty-fourth inning Daly made a draw along the rail, but Sexton made a claim of no count, which was allowed and Daly took his seat with a crestfallen air, having made 7. Sexton followed with a miss, and Daly in his next inning made 2. Daly in his forty-eighth inning made a fine cross-cushion carom, which caused the spectators to applaud him liberally. The betting was now 50 to 40 on Daly, but little business was done. At just two hours from the start Daly completed 250 points, or just half the game, being then 57 points ahead of Sexton.

Sexton completed his second hundred two hours after the start, his average being 4. In fifty innings Daly made six double plays for an aggregate of 129, while Sexton in fifty innings made six double plays for 86. The play now fell off and misses were pleuty until the fifty-fifth inning, when Sexton by fine open work made 20. From the fifty-third to the fifty-sixth inning Daly scored nothing, but in the fifty-seventh inning he made 4, Sexton following in the same inning with nothing. Daly played a direct carom in the fifty-eight inning and retired with 5. In his next attempt he went round the carom hall, and the spectators gave a loud whistle of disappointment. Daly completed 300 points in two hours and thirty-three minutes, his average being 4 6-11. Sexton's score at that time was just 250.

In the seventy-third inning Daly made a six-cushion carom, which was loudly applauded; the run netted him 60. Then Sexton got the balls together on the rail, and by a succession of delicate bank shots and close caroms made 26. At 10:45 o'clock Sexton turned into his fourth hundred, with an average of 4 8-730. Daly was then thirty-eight points ahead, and playing in a manner which caused almost continuous applause. The play all through the game was most brilliant, and the averages of both men were better than the record. In the seventy-ninth inning Daly, by wonderful nursing, made thirty points, the majority of which were from the lower rail. In the eighty-second inning Daly made a difficult masse shot, the first of the game. In this inning he also made a brilliant cross-cushion kiss, which counted, much to the delight of his friends. Daly completed 400 points in 3:17 from the start, and his average was 4 68-83, his average for the single hundred being 5 15-17. In the ninety-ninth inning Sexton played for safety and left the balls in a position only to be reached by a long cross-table bank, which was accomplished by Daly, amid great applause. At 11:40 Sexton made 400 points, his average being 4 12-97. During the next hundred points Sexton made several desperate attempts to close the gap between himself and Daly, and on four different occasions was within two of his opponent, but was finally beaten by thirty-two points. The following is the score by innings:

DALY.—7, 1, 3, 1, 13, 5, 3, 5, 4, 0, 44, 13, 6, 0, 0, 8, 5, 0, 1, 2, 2, 0, 11, 10, 6, 1, 6, 1, 21, 1, 60, 8, 2, 4, 0, 4, 0, 18, 5, 1, 1, 1, 7, 2, 8, 0, 7, 5, 8, 4, 1, 0, 0, 0, 0, 0, 4, 5, 0, 0, 1, 1, 2, 2, 13, 9, 1, 7, 0, 2, 1, 4, 6, 1, 8, 18, 1, 1, 31, 0, 2, 10, 4, 0, 0, 3, 0, 0, 4, 1, 0, 0, 16, 7, 7, 3, 0, 0, 0, 0, 1, 13, 2, 1, 0, 0, 2, 21, 0, 0, 0, 3, 0, 3, 0—Total, 500.

SEXTON.—0, 1, 1, 0, 7, 0, 7, 1, 10, 1, 7, 11, 0, 0, 0, 11, 1, 11, 0, 1, 7, 7, 13, 3, 7, 30, 1, 0, 6, 4, 5, 4, 0, 2, 5, 7, 2, 0, 0, 0, 0, 0, 0, 2, 0, 2, 8, 2, 5, 3, 5, 1, 0, 1, 0, 20, 0, 0, 1, 5, 10, 1, 3, 0, 0, 4, 0, 3, 0, 5, 7, 3, 8, 26, 4, 1, 0, 0, 6, 13, 0, 0, 0, 3, 10, 14, 10, 1, 6, 5, 2, 0, 3, 0, 10 8, 0, 25, 6, 11, 0, 5, 0, 0, 0, 6, 6, 2, 1, 2, 0, 0, 6, 0, 0—468.

Total—Daly, 500; Sexton, 468. Winner's average, 4 4-5-115; loser's average, 4 12-114. Time of game, 4:32.

PLAYING FOR HEAVY STAKES.—Advices from the City of Saints state that Bill Norton and friends of his from Wood River, together with a well-known stage line owner of Salt Lake, frequently have a little game of cards, during which the pot holds from $20,000 to $40,000. The Idahoans lately took $40,000 from a prominent Virginia City official who took a hand with the boys in the city by the briny lake.—*Wood River Times.*

A few days ago Mr. Putzman and Mr. Rondeau were at Mission San Jose on a hunting trip. They bagged twenty-one quail. Considerable good sport was had, as the [illegible] weather seems to have made the game livelier [illegible] averse to open ground as they were a short time s[illegible]

Lines will average ten words. A discount of 10 per cent. will be allowed on 3 months, 20 per cent. on 6 months and 30 per cent. on 12 months contracts. No extra rate charged for cuts or cutting of column rules. No reading notice take for less than 60 cents each insertion.

San Francisco, Saturday, January 20, 1883.

Mr. M. J. Henley is a duly authorized traveling agent and correspondent for the "Breeder and Sportsman."

PROTECTION FOR GAME AND FISH.

All those who are interested in protecting the game and fish of California are looking for the present Legislature to take action in the matter. There cannot be a question of the importance of putting an end to the present devastation, as it is patent that without effectual aid from the law makers it will not be long until there will be very little to protect. With proper laws, and above all, the enforcement of laws, this State will always be benefited by an abundance of game and food fishes. The natural advantages are such that by observing the laws which govern propagation there need never be a lack, and the whole of the population is, in a measure, interested in protection being granted. There is a prevailing opinion that sportsmen are the only parties who desire that the objects of their pursuit shall be properly guarded, and although these may be the most active in demanding legislation and seeing that the laws are enforced, there is scarcely an inhabitant who has not a stake in the contest. The supineness of the body of the people is not the only thing in the way. There is a general impression that "game laws" are part of the code of countries where everything is subservient to wealth and power, and that in this free country there should be no hindrance to anyone helping themselves from the stores that nature has provided. If it were asked that there should be a heavy license paid by the shooter or fisherman, so heavy that only those possessing more than moderate means could indulge in the recreation there would be some strength in the reasoning. All that is solicited is that there should be means taken to preserve this store, not for the sole benefit of the sportsmen who have the means to go into the field with all of the best and most expensive implements to pursue the denizens of earth, air and water, but also everyone who has the desire to shoot or cast a line. In fact the poorer derives the most benefit. The wealthy can go to distant places, spend both time and money to gratify their tastes, and the cost is a small part of the calculation. The object of more stringent laws is to place the game protected within the reach of all. The artisan or mechanic, who labors almost incessantly, and who has a fondness for outdoor sports, is given the opportunity with the loss of little time. A day or two in a month from the clang of the workshop, the tumult of the city, is a boon which they will heartily appreciate, and in place of seeking amusements that enervate, they return with renewed life and vigor to pursue their daily avocations. The farmer's boy will do double the work in the hours allotted for labor when that labor is sweetened by thoughts of sport within his reach, and all of these when made to understand fully the merits and meaning of the law will heartily join in a petition for the passage of acts that will effect the purpose.

At the present time we only desire to bring the subject before the people, and to urge that not a day be lost in taking the steps to secure it being brought before the legislature as soon as possible. The *Breeder and Sportsman* will do everything it can to further the object, but there must be joint endeavor to insure success. The sportsman's clubs must take the initiative. These must draft the laws that are requisite, giving special attention to the sections that bear on enforcement, and on the proof necessary to convict. This is the main thing to consider and without which enactments will be of little avail.

All we contemplated in writing this article was to call attention to the necessity of action, and without touching on the questions that will arise. We sincerely hope to announce in the next issue that the proper steps have been taken, and when the plan of the battle is decided upon our part of the fight shall be made to the best of our ability.

THE BONNIE SCOTLAND BLOOD IN CALIFORNIA.

In another part of this paper will be found an article copied from the New York *Spirit of the Times*, with some introductory remarks in relation to Bonnie Scotland. Again, the subject of the memoir is at the head of the list of "winning sires," this place being awarded on account of the aggregate winnings of his get being in excess of any other blood sire in the United States. The rule which accepts this as the standard is the practice in England, America and Australia, and although it appears to be the only method which will avoid disputes, it is not conclusive evidence of superiority. Bonnie Scotland, however, has other claims, that are shown in the article, among which is the large number of sixty-one starters and thirty-seven winners of races during the year 1882.

It is to be regretted that there is so little of this blood in California. So far as we are informed there is only one daughter, Libbie Dunbar; and in the next generation are the progeny of this mare, Marion, the dam of the Duke and Duchess of Norfolk and X X. Libbie is the dam of Lena Dunbar, who may be safely rated as a remarkably good filly, fast, game and honest. The Duke of Norfolk we always held to be one of the foremost racehorses of this or any other country, and there is no question that when the Duchess was "at herself" she was of the same caliber. Her race in the Pacific Cup last spring was a grand one, and this did not appear to be a full measure of her capacity. X X is a double grandson, his sire Malcolm – the sire of Marion—and his dam Columbia by Bonnie Scotland. He was ailing from the time he was weaned until he was eight years old, which prevented him making any figure in racing, though he exhibited a fine rate of speed, and he has been our trial horse for the first test of the various experiments in shoeing we have made in the past eight years. There were two daughters of Bonnie Scotland brought here both of them dying before being of any service in the stud. One belonged to ex-Governor Stanford, a very highly bred mare, and the other was Lady Fairfield, a sister to Ontario. There is a trotting broodmare at Palo Alto which is a granddaughter of Bonnie Scotland, and if we are not greatly in error her progeny will be no discredit to the champion, if she has a share of the plebeian blood.

MISTAKES.

Talleyrand is credited with the remark that "a blunder is worse than a crime," and though this may be rather too harsh a construction, if qualified so as to read that the effects of blunders are, in some cases, worse than crimes, there would be a general acceptance of the position.

The amateur race between the two fastest "sprinters" on the Coast is an exemplification that ought not to be overlooked, and a short sermon on that topic will be in place. "Adversity is the best teacher" is another saying, and those who benefit by previous mishaps, blunders and mistakes, are apt to concede in the truth of the proverb. That there was a serious mistake made in that race is clear. That the non-enforcement of the rule gave a chance for harsh criticisms and charges which are, probably, without foundation, was to be expected. The penalty for the "break away" should have been inflicted, and notwithstanding the generosity of Mr. Haley, his competitor should have been placed where his overanxiety to get the best of the send-off compelled the starter to place him. Those who lost money had the right to expect that every legitimate means would be taken to insure their venture, and when the unfortunate slip occurred it is not surprising that there were growls and anathemas at the blunder.

To surrender an advantage lawfully obtained is analogous to throwing up a hand at whist, when the holder has more than his share of trumps, or, to refuse to take tricks that he could win.

When the money of others is depending, he has interest besides a gratification of generosity which would be praiseworthy under other circumstances. Coupled with the slip on the scores it gives room for suspicion. Had Masterson stopped when Haley slipped there would have been a parity of conduct, and then each could have claimed to be the Admirable Crichton of the cinder paths.

That the favorite might have been beaten by his opponent on that day, independent of mishaps, does not figure in the calculation. Had he been three feet in advance when the pistol was fired it is not likely that he would have been so eager to get away, and avoided the misstep. As it stands, it gives the chance to call into question the integrity of the beaten party, and brings the sport into disrepute.

Enforce the rules strictly, impartially, is our advice, and amateurs should be more anxious to guard against blunders than those who make a business of footracing. The latter are looked upon with suspicion, the former are supposed to be far beyond contaminating influences, governed by higher thoughts than winning money, and to sustain this good opinion every effort should be made.

THE FOOTHILLS.

Very beautiful are the foothills of California. Productive, too, and susceptible of being turned to a variety of uses. The old idea that the only good that could be got from them was a range for stock, has long been exploded, and at the present day the merit of the rolling lands is fully acknowledged. Among the cheeriest homes of California are those which nestle among the hills, and the inhabitants regard the dwellers in the valleys with a feeling akin to pity. That is, those who live in the big valleys, miles away from the hills, and with a dreary, level plain extending in every direction. There is a charm in inequality, a delight in the ever-varying scenery of the foothill lands. There is the opportunity for selecting a site for the home according to the fancy. Now, in some sheltered cove between the spurs, where the creek brawls over the stones for the greater part of the year, and where the emerald hue of springtime comes the earliest. On the sunny side of the slope where the morning rays are welcomed, and where the birds carol when the streamers are tinting the orient.

Then there is the chance for ornamentation in either case. There is a dwarfed appearance in even the large grounds surrounding an imposing villa when there is nothing but a dead level for the landscape gardener to show his genius upon, while in the ravine or the hillside, every tree, bush, shrub or flower, has additional beauty from the situation. On the large plain there must also be immensity, and nature when it beautifies, does it on a large scale. Oaks of centuries' growth, giant sycamores, huge elms. Among the hills are vines and flowering shrubs, crab-apples and hawthornes, and rhododendrous primroses and violets. Asthetic tastes are not the only ones that find gratification among the foothills. There is the home of the pear and the apple, there the vine flourishes in the greatest perfection, and there is a higher and more perfect flavor in the smaller fruits. There is an aroma in the strawberry and raspberry, and the blackberries grow large and luscious. What matters it if the yield of wheat is a few centals less to the acre, and that the barley crop is comparatively barren. If the lordly Durham requires a richer herbage, the Devon, the Jersey, the Ayrshire are at home, and the milk and butter are such as an epicure would choose. There may be drawbacks; there are assuredly advantages. The man whose main capital is a stout heart and willing hands can earn for himself and family a cosy dwelling place among the offshoots of the Sierras. Those who are more forehanded can increase their possessions without the corroding cares that haunt the grain farmer. There is rarely a lack of moisture, all that is needed to perfect the fruit and vineyard is generally furnished from the clouds, when at rare intervals that fails, there are the streams which have their source among the snow-clad mountains to draw upon. There is a grand future for these portions of California that lie between the Sierras and the valleys and that run well-nigh to the summits of the Coast range. There is nothing more certain that in the future, not the far-off future either, when the vine in California will outrank any other product of the soil. Wheat is bound to lose the scepter, taking second place, and then give way to the orchard and garden. It will be well for the State when that time comes. There may be a few large vineyards, but the bulk of grape growing will be in the hands of the many, and then there will be a population that will consume the greater proportion of the home field crops. The great grain, sheep and cattle ranches will be divided when the land becomes too valuable to be used for these purposes, and in lieu of fields and enclosures of thousands of acres, there will be the smaller farmer on the plains, the vineyardist and horticulturist on the hills. The possibilities of this country are so great that it staggers the imagination to think of what a few years are likely to bring forth. The grandest country in the world for rearing horses, equally as good facilities for producing the finer breeds of cattle and sheep, a soil that has yielded over eighty bushels of wheat to the acre, and other cereals in proportion, and vegetables beyond the limit of the most favored garden spots of the East.

There is scarcely an end to the capacity of the foothills. When what are considered the most eligible portions are divided into homesteads of from twenty acres up, the settlement will be pushed into higher altitudes, and steeper grades brought under cultivation. Ultimately soil will be carried on to barren places that are otherwise favorable and these spots reclaimed from the rocks may produce the rarest wines.

In this connection it is proper to say that we are promised a series of articles on grape culture, fruit growing and other industries of the foothills, and as the gentlemen who have so kindly tendered their services have a thorough acquaintance with the subject, these articles will be of the greatest interest to a majority of our readers.

EDITORIAL NOTES.

W. W. Traylor, a well known and popular resident of this city, died at his residence, No. 2,110 Broadway, at half-past nine o'clock, Thursday morning. The deceased was secretary of the Eureka Consolidated, Pinal Consolidated and other mining companies. He was born in La Grange, Troup county, Georgia, in 1820, where he received an academic education, and in 1849 came to this State, locating in Tuolumne county, where he resided several years, serving one term as County Treasurer. He subsequently came to this city, where he engaged in business as a dry goods merchant. He was elected secretary of the Eureka Consolidated Mining Company in 1870, and has ever since occupied the position.

Mr. Traylor was one of the most prominent sportsmen of the city. He was at the time of his death State Fish Commissioner. He was one of the organizers and members of the Teal Shooting Club which has fine preserves in the Suisun marshes. He was a prominent members of the California Sportsmens Club, and served several terms as President when in the legislature he looked sharply after the interests of the game and fish of the state.

Mr. Traylor was a most enthusiastic lover of the rod and reel and was an expert angler. He knew all thestreams and was well posted in varieties of flies, etc. He was a good shot also and his "string" of ducks at the end of the season nearly always numbered up near the top. Mr. Traylor has been in failing health for some time. A genial companion, pleasant friend, and ardent sportsman, his loss is keenly felt by a wide circle.

A report has been going the round of the sporting papers that a match had been arranged between Overman and Ewing, to be trotted at Chicago in June next, the time not definitely fixed, the stakes not to be less than $5,000 nor more than $20,000 a side. In this connection the *Breeder's Gazette* says: "Mr. E. S. Stokes is said to have acted for Overman in the making of this match, but when the mists of champagne, which at present throw a glamor over the affair, have subsided, it will probably be found that the race was entirely "around the stove," and the *Gazette* feels warranted in predicting that it will never be trotted. Mr. Stokes does not own Overman, nor any part of him; and it is not at all likely that the gentleman who does own the horse—Capt. Kohl—has delegated his authority in the matter to anyone. That Col. Shaughnessy is willing to make the match there is no doubt, but he will find that unless the owner of Overman is consulted the horse will not be allowed to trot."

In another column will be found a challenge from Mr. J. F. Carroll to all the coursing men in this State. The challenge is bold and sweeping and means business, for Mr. Carroll has put up $100 deposit in our hands to back it up, and we hope to see the money covered before the week is up. Mr. Carroll's dogs are well known though he does not name them in his challenge. Chief of the Canyon, Tampete, Sallie Henry, Culverin, Lady Plaice, Lady Franklin and Speculation have all owners who think they are world beaters and it would afford Mr. Carroll especial pleasure to recieve an answer from any of them, though his challenge is open to all.

Sotoyome by Pilot, his dam Avola by Alhambra, granddam Oriole by Simpson's Blackbird; bred by B. C. Wright of Sanel, Mendocino Co., foaled in 1881, has been purchased by W. H. Bow of Seattle, W. T. Pilot was by Reveille, a brother of Owen Dale, and was quite a noted racehorse. Alhambra by Mambrino Chief, his dam Susan by American Eclipse, Blackbird by Camden his dam by Postboy. Sotoyome is a very highly found colt, and as is shown by the above pedigree his blood is of the best kind.

The trotting stallion, A. W. Richmond, has been sold by Hancock Johnson to Hill & Grieg of Ventura county, and he will be placed at the head of their stud. We shall watch the career of "Alf" with much interest. With one-half the opportunity that others have had he would be high on the list of trotting sires, and we hope he will be appreciated in his new home.

The stockholders of the Monterey District Agricultural Society held their annual meeting last Saturday and elected H. S. Ball and O. H. Willoughby as directors in place of H. S. Ball and P. F. Dean, whose terms had expired. A resolution was also adopted making the new society responsible for the debts of the old association.

A car-load of thoroughbred stock, Holstein, Jersey and Ayrshire cattle, consigned to Mr. William Niles of Los Angelea arrived from the East a few days since. Some Berkshire hogs and fine poultry were also brought out. This stock was personally selected by Mr. Niles and arrived in excellent condition.

Name Claimed.

By H. M. Johnston of Ela Hill's stock farm, Los Angeles county.

ROSARIO for black colt by Del Sur, dam by Overland, second dam Maggie Mitchell.

Indians say that white men are killing fish with giant powder near the mouth of the Truckee. There is considerable truth in the assertion, for many of the fish sold here show no marks of a hook or spear, or anything else of the sort. This can be easily substantiated by examining the trout exposed for sale by dealers. If the rascally fishermen are caught at their nefarious work they should be hoisted with their own explosives.—*Reno Gazette.*

Answers to Correspondents.

Questions answered only through these columns. No replies by mail or telegraph.

H. W. S., Cayou City, Oregon:

1. LODI, bay horse, foaled 1860, bred by John M. Clay, Lexington, Kentucky. By imported Yorkshire.

First dam Topaz, by imported Glencoe.
Second dam Emerald by imported Leviathan.
Third dam imported Eliza by Reubens.
Fourth dam Little Folly by Highland Fling.
Fifth dam Harriett by Volunteer.
Sixth dam Lady Sarah's dam by Alfred.
Seventh dam Magnolia by Marske.
Eighth dam by Bahraham.
Ninth dam by Sedbury.
Tenth dam old Ebony by Basto.
Eleventh dam Massey Mare by Mr. Massey's Black Barb.

See "Bruce's American Stud Book," vol. ii, page 364, and vol i., page 83.

2. BILLY CHEATHAM, chestnut colt, foaled 1853, bred by John Harper & Co., Woodford county, Kentucky. By Cracker.

First dam Lucy by Mingo.
Second dam by Brunswick.
Third dam by Moses.
Fourth dam by Sumpter.
Fifth dam by Top Gallant.

"Bruce's American Stud Book," vol. i., page 674.

J. G. D. Bellota, Cal.,

1. MAMBRINO CHIEF, bay horse, foaled 1844, bred by Richard Eldridge, Dutchess county, N. Y. By Mambrino Paymaster, son of Mambrino, he by imported Messenger.

Of the dam of Mambrino Chief nothing is known.

2. PILOT JR., gray horse, foaled 1844, bred by Lugerean Gray, and foaled the property of John T. Gray, Grayholt, Jefferson county, Kentucky. By old pacing Pilot, a black horse of unknown blood that, it is said, was brought from Canada.

First dam, Nancy Pope, by Havoc, son of Sir Charles.
Second dam, Nancy Taylor, by Craig's Alfred, son of imported Medley.
The dam of Pilot Jr., has never been traced further.

T. C. W., Fresno:

The only Clydesdale Stud Book we know of is that compiled by the American Clydesdale Association. A limited edition only was printed and sold at $5 per copy. If any are now to be had you may ascertain by addressing J. H. Sanders, *Breeder's Gazette,* Chicago, Ill., who had them for sale.

EDITOR BREEDER AND SPORTSMAN: Will you please decide the following disputed point in a game of cribbage: A plays a 7, B plays an 8, and takes 2 for the 15. A plays a 9 and takes 3 for the sequence. B plays a 7 and claims 5, 3 for the sequence and 2 for the 31. A claims B is only entitled to 2.

Answer—B is right. He is entitled to 5.

A Draw Game.

The pigeon shooting match between Mr. Demorest Grant and Lord Maneville was shot on the grounds of the Westminster Kennel club New York on the 10th inst. Darkness came with the sixty-fifth bird, the record standing exactly even and the match was left unfinished. The severe storm prevented good shooting. The conditions of the match, which was for $1,000 a side, were to shoot at 100 birds, each at thirty yards rise, from five traps, with guns and under the amended Hurlingham Club rules. As the match was not only not concluded, but resulted in a tie as far as shot, all bets were declared off and the contestants will shoot a new match in the spring of the year.

The score was as follows:

Mr. Grant.—0 1 1 1 1 1 1 1 0 1 1 1 1 1 1 1 0 0 1 0 0 0 0 1 0 1 0 1 1 0 0 0 0 1 1 1 0 1 1 1 0 1 1 0 1 0 1 0 1 1 1 0 1 1 0 1 1 0 1 1 1 1 1 1 1 1. Killed, 45; missed, 20.

Lord Mandeville.—0 1 1 1 1 0 0 1 0 1 0 1 1 1 0 1 1 1 1 1 1 0 1 0 0 1 1 1 1 1 0 0 1 0 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0 1 1 1 1 1 0 0 0. Killed, 45; missed, 20.

Got it Down Fine.

A Comstock sharp has figured out the possibilities of the game, and the *Enterprise* prints the result of his labors: He makes the chances of helping a pair on a three card draw one to eight for a triplet, for another pair the same, and for a full hand one to sixty-one, and for four of a kind one to 364. The chances of improvement are thus a little more than one to five. If you go in on a pair of jacks and three players are against you, which is the average with six players, the average chances are that you are playing against one better hand and two poorer ones. When you reach aces you have in all probability the best hand. The mathematical expectation of a flush when you draw to four cards of a suit is one to five. A straight flush is obtainable once in 300,000 deals. To get it pat takes twice as long.

It pays to raise hogs for the market, even on grain lands. During the last three months over 500 head have been fattened on the Ord ranch, Butte county, and sold to butchers from other portions of the State. The profit on the lot was between $2,000 and $3,000. They were fattened upon corn raised on the place.

The Duchess hull, 8th Duke of Tregunter, has recently been sold in Australia at public sale for $20,000. The occasion was the dispersion of Mr. C. B. Fisher's herd, at Melbourne, 150 head selling for about $75,000.

A restaurant at Tombstone, Arizona, treated its patrons to a wild turkey dinner a few days since. Eighteen birds, aggregating 147 pounds, were served up.

A two-year-old hog weighing 500 pounds was slaughtered and hung up in a Red Bluff butcher shop recently.

ATHLETICS.

Haley and Masterson.

The Masterson-Haley match at the Recreation Grounds last Saturday was very unsatisfactory to the spectators who paid gate money to see a good race, and the majority of the pool buyers are loud in their denunciations of the entire management. Pools were two to one on Haley. The agreement distinctly specified that it was to be a penalizing race. Masterson made a decided break of several yards over the mark, but, notwithstanding the fact that considerable money was bet on the event because it was generally understood that it would be an honest race between amateurs, he was allowed to start from scratch. Haley slipped on the start, losing several yards, and Mastersou opened a gap of six or seven yards that decided the race without running it out, and he finished the last fifty yards in a jog. Time 10 2-5. The track was said to be slow, but there was a decided fall of a foot or more from the start to the finish, and the times of the heats of the other race prove that it was not slow, if the timing was correct. The fun was all in the heat race, (horse race, the boys called it) five heats being run before the first prize was won by Jones and Slater and Harris ran a sixth (work enough for one afternoon) for the second prize, which was won by Slater. The slowest time of the heats was 11 seconds, won by Slater, and the fastest 10 3-5, won by Jones. The latter in good form can do a shade inside of 10½, and Slater has repeatedly done 10¾, and will probably do 10½ next summer.

There has been so much dishonest management on this Coast, that the public have lost faith in races of all kinds, and simple carelessness or ignorance on the part of the management is no excuse to the ones who have been deceived two or three times. One or two more affairs of the kind ought to convince the officers and members of the Olympic Club, and amateurs generally, that the Olympic Club and University grounds across the bay, with intelligent management and at least seven months of good weather every year, are the best facilities for developing amateur athletics on the Pacific Coast.

Gibson and Pendegast.

The following is the Woodland *Democrat's* account of an event that has been the leading topic among the sports of Yolo for some weeks. The race was on last Wednesday, the 17th inst.:

The foot race between Pendegast and Gibson, which has been the principal subject among the sporting fraternity for some weeks, came off yesterday and was won by Gibson in not very fast time. The race was for $250 a side, and the distance 250 yards. There seemed to be a general impression among Charlie's friends from the first that the distance was too far for their favorite, and not a very large amount of money was laid on the result, and even then Gibson's backers gave about two to one for all the bets they made. About five or six hundred people had assembled at the track by two o'clock, and kept themselves warm by walking up and down the stretch for an hour, waiting for the contestants to appear. Soon after three o'clock, a shout of "Here they come" was heard, and the racers, were seen coming up the track attired in their running suits, with large overcoats wrapped around them. When their wraps were thrown off and they began scoring for the start, Gibson was seen to be the more powerfully built man of the two, and competent judges remarked that he was in much the best condition. The thermometer being at the freezing point, not much useless time was wasted, and the word "go" was given. Pendegast sprang to the lead at once, and both men seemed to run their level best for about 150 yards, when Gibson's excellent training and superior wind began to tell, and he passed Pendegast, maintaining the lead he gained until he broke the string about ten feet in advance. The last 50 yards was not run fast, and the time made was slow—about 28 seconds. The first 100 yards were run in about 10 seconds, and many are of the opinion that Pendegast can beat Gibson this distance, and they are willing to back their judgment with any sum up to $1,000. Undoubtedly Gibson and his backers are of the same opinion, as they refused to make a match of this kind last night, and left on the train this morning for San Francisco.

A WALKER.—"You see that man—the one with the grizzled beard, slouching down Main street there—that's Wahash, the walker. He's just got back from British Columbia—walked every inch. Ride? Him! You couldn't hire Wahash to ride. A friend of mine, coming over from Silver City once with a team, met him way off there and tried to give him a lift, but he wouldn't have it. Bound for Walla Walla, too. They do say he footed it out here from Indiana and I know he's been footing it ever since. For a living? Why, he walks, just walks—that's all."—*Walla Walla Statesman.*

BAY FISHING.—The bay fishing has been very poor since the first of the year. The cold snap has driven all the finny tribe away from the shores into the deep water and though some good fishing has been had from the boats there has been nothing done to boast of. A few days ago Mr. Stewart caught 22 big rock-cod, one of which weighed two pounds. This gentleman also had some excellent luck near California City last Saturday, the catch being black rock-cod, red rock-cod and sea trout. Though the tides are favorable for good fishing none will be had till the weather is warmer.

The BREEDER AND SPORTSMAN in its issue of Dec. 23, publishes an elegant picture of Mambrino Wilkes, by George Wilkes, dam Lady Christmas, by Todhunter's Mambrino. We congratulate Mr. Simpson upon his fine illustrations some time ago. We have never seen a poor one in his paper. —*N. Y. Sportsman.*

A champion billiard game, three-ball carom, came off at Slavens Hotel, Borden, Jan. 8th, between H. Levy, N. Manaase, and B. K. Bagder, for $120. The time consumed by the game was one hour and forty-five minutes. The score stood: Manasse, 100; Badger, 88; Levy, 76.

There will be a shooting tournament held at Schuetzen Park, Alameda, to-morrow, by the California Schuetzen Club. The object of this shooting is to raise money to aid the needy ones of Germany.

Many fine wheat fields in northern Solano have been devastated by wild ducks which visit the fields at night in thousands. As a protection some of the farmers have out lights.

THE GUN.

From Alviso.

Last Sunday the hunters at the Alviso marshes had more than ordinary good luck. The birds were flying lively all day which gave the breech loaders but little time to cool off between shots. The last trains brought home jolly, well-satisfied parties of sportsmen as one could desire to meet with. Among them were Mr. Hoefling and Mr. Spencer. These gentlemen went down in the morning and returned in the evening with 70 ducks, sixteen of which were cans. The smiling faces of John Stack and Harry Golcher spoke plainly the satisfaction they felt over the success they had in bagging 40 of the web-footed feathered tribe. Dr. Card and Mr. F. Drinkhouse scored 30 ducks. Mr. Ault got aboard the train at The Bridges and threw down his bag of 30 ducks with as much indifference as though that number of birds could be killed any day. Mr. E. Briggs at the same place, The Bridges, came home satisfied with 24 ducks. Drs. Lewitt and Kane and Mr. M. Graham bagged on an average 20 birds each. Close to the M. D. party were Capt. Walker and Mr. Hoefling Jr. These two were pumping lead quite vigorously into the ranks of the feathered wanderers of the north. They brought in 30 ducks, seven of which were nice plump cans. Take it all in all, the sport in the Alviso marshes is very satisfactory. The cold weather instead of driving the game away seems to drive them in for shelter. More canvasbacks are seen and killed in this vicinity this year than ever before.

The Williams-Havens Match.

Last Saturday the clay pigeon match between A. W. Havens and N. Williams took place at Adams' Point. The terms of the shooting were 50 clay birds, 20 yards rise, for the sum of $20 a side. Though both these gentlemen are good shots, their scores were very poor, but that might be excused on the ground that a strong, bitter cold wind was blowing across the point which carried the clays about in a very uncertain manner, beside chilling the fingers of the marksmen. To say the least the shooting was very unsatisfactory to the principals as well as what few spectators there were present. Messrs. W. G. Crandall and L. Judson acted as judges and Mr. W. E. Miller as referee. Following are the scores:

N. Williams	1 1 1 1 0 1 0 0 1 0	6
	1 1 1 0 1 1 1 0 1 1	8
	0 1 1 1 0 0 1 1 1 1	7
	1 0 1 1 0 1 1 0 1 1	7
	1 1 1 1 0 0 0 0 0 1	5
Total		33
A. W. Havens	0 0 0 1 1 0 1 0 0 0	3
	1 0 1 1 1 1 0 1 1 1	8
	1 0 0 0 1 0 0 1 1 0	4
	0 0 1 1 1 1 1 0 0 1	6
	0 1 1 0 0 1 0 1 1 0	5
Total		26

Shooting on the New Grounds.

Last Sunday several pigeon matches were shot at the Oakland Trotting Park. These grounds though new to trap shooters are handy to the railroad and easy of access to the city and as soon as proper accommodations are provided in the shape of sheds, traps and benches for spectators they will be second in popularity with the sportsmen to none in this vicinity. Its being but a short distance from Shell Mound Park will make the place all the more attractive as all who desire can practice with shotgun or rifle without losing too much time traveling from target to trap. But to the match: The shooting began about 1 p. m. The first match was for six birds, 21 yards rise and 80 yard bounds. The entrance fee was $2 50. Five men entered. The purse was divided, $7 50 to the first and $5 00 to the second best shots. Following is the score:

P. D. Linville	1 1 1 1 0	5
Jas. Smith	1 1 1 1 0 1	5
Jno. Ferguson	0 1 1 1 1 0	dr
N. Williams	0 1 1 1 1 1	5
S. C. Slade	1 1 1 1 0 1	5

As four of the men tied on five birds they agreed to shoot off the tie; in this Slade got off with first money and Linville and Williams who tied divided second money. In the second match the same men entered for a similar sized purse. In this match Linville and Ferguson tied and divided the puree:

P. D. Linville	1 1 1 1 1	6
N. Williams	1 1 1 0 1	4
S. C. Slade	1 0 1 1 1	4
J. Ferguson	1 1 1 1 1	6
J. Smith	1 1 0 1 0	dr

Several smaller matches came off but they were of little importance.

SAN BRUNO.—Like all the marshes situated down the bay this place too has its share of game at present; though not so much frequented by hunters as Alviso or Alvarado, those who go down have good sport and fair luck. Mr. J. Kerrigan was down there last Sunday and bagged forty ducks, Mr. Obenshaw came off thirty ducks better, Mr. Precht killed a good bag of fresh water teal and mallard by following up the course of one of the creeks. The birds are all fat and very toothsome. On the train home a youthful sportsman exhibited a bag of 125 ducks which he claimed to have shot on the marsh, but the ducks looked like those that had been feeding in fresh water and the size of the bag caused other hunters to make an investigation which brought out the fact that they were killed at the lakes by a one-armed market hunter and sold to this youthful nimrod. The small number of empty brass shells that he carried in his belt also stood as circumstantial evidence rather in disparagement of the youth's truthfulness. And furthermore "his nibs" had more money when he went down than when he returned, necessary expenses taken into consideration.

Good duck shooting is to be had at Millbrae. Several hunters who went down last Sunday met with good success.

THE BEAR.

A Disquisition on the Grizzly of the Rocky Mountains—The Black Bear of America.

It is now pretty well settled that we have three kinds of bears in the United States and the territories belonging thereto, namely the grizzly bear, *Ursus Horribilis*, found in the Western United States and territories; the Black bear, *Ursus Americanus*, found throughout the United States generally; and the White or Polar bear, *Thalarctos Maritimus*, found in Alaska. The one most commonly known is the black bear, and the most ferocious is the grizzly. The brown and cinnamon bears are mere varieties of the black, and young ones of these different colors are frequently found in the same den, having the same mother.

This being understood at the beginning, it will be easy to explain what is now known in regard to the bears and their relationship to one another, so far as those belonging to the United States are concerned. The grizzly is the most ferocious, and is in fact the most formidable animal in America, and would be no mean match for the African lion. His huge bulk, tremendous strength, and invincible courage, render him a terror to foes of every kind. While seldom seeking a fight if unmolested, it never retreats from one when fairly engaged. She bears with young ones are sometimes aggressive, and it would always be the better way to keep out of her path when it can be avoided.

Grizzly bears are quite common in the Rocky mountain region, where they live on such animals as they can overtake and kill, and when this fails they dig up the bear grass, a species of yucca, that is very plentiful. I have known them to invade a settler's cabin and carry off a pig, or rather a good sized porker, the settler all of the time knowing what was going on, but glad to get off with no greater loss. I have seen several men who have been terribly used up by these bears, and among the rest the Nez Perces chief Lawyer, who had his arm crushed in a dozen places by one of these brutes. Mr. James Baker, a scout, was also badly maimed, and crippled for life. When roused, the grizzly manifests great fury, and his wonderful strength enables him to overcome almost any foe.

In winter the bears keep quite still, being in a kind of torpid state, when they require no food, and doze away the cold days and nights. In the fall of the year they are very fat, and by the time spring returns are as poor as can be, the hibernation having disposed of all the surplus fat. Perhaps they go out during the winter, when the weather is not too cold, but as a general thing they stay rolled up in a hunch in their cave or den, and keep warm as well as they are able, not appearing to suffer any, and being lost to all kinds of sensation.

One of the largest bears I have ever seen was in Texas, while crossing over from the El Paso road to the Baudera Pass. The whole way seemed infested with bears of the cinnamon-black species, and way off in the valley below us we saw a tremendous fellow, full as large as an ox, standing up on his hind feet and looking at our party. We did not molest him as he was a considerable distance off, and I always recollect him as being the finest specimen of Bruin it has ever been my fortune to meet with.

The general characteristics of bears are a large, thick, clumsy body; feet entirely plantigrade; soles naked, and nails long; tail very short; head broad, with forty-two teeth, namely: twelve incisors, four canines, sixteen premolars and ten molars. The claws referred to are of immense size on the grizzlies, measuring from six to seven inches in length, and capable of inflicting dreadful wounds. The danger is in getting too near a bear's claws, for, aside from giving you a dreadful hug, the grizzly uses his teeth with great effect, and is capable of tearing the whole scalp off a man's head at a single blow. Indeed, a blow from a grizzly has ere now stretched a buffalo lifeless on the plains, the bear lying in wait, and at the proper moment dealing the blow. There are several well authenticated instances of this kind, and besides killing the animal, the bear has dragged him away several rods into the bushes.

There is no end to the stories that are told about the bears, some of which are interesting enough. We know how fond the black bear is of sweets and how he often attacks the bee-hives, his long hair furnishing him a pretty good protection against the stings of the bees. It is also said that Bruin has a decided love for liquor, provided it is well sweetened, and in his cups is as silly and senseless as an intoxicated human being. Some of his antics while intoxicated are strangely like those of his more civilized and cultivated cousin, and are singular enough. When young, bears make interesting pets, but as they get older they become morose and cross, and are very apt to do some mischief before they are finally disposed off.

Indians bring in the cubs to sell, and drive sharp bargains provided there are strangers near to act as purchasers. The Indians themselves are very superstitious about the bears, and after one has been killed they talk to it telling how sorry they are that they should have been obliged to take its life, and how much good his visit has done them. They address the bear as brother, and promise all sorts of things, provided its spirit will not think unkindly of them for what has been done. The young braves in their dances endeavor to imitate the movements of a bear, and the more successful they are in this particular, the more satisfied they are with their own demeanor and grace; the slow movements of Bruin are thought to be exceedingly becoming.

In the mystic legends of the aborigines Bruin has his full share of honors, some of which are told in the song of Hiawatha. It was but natural that the savages should think a great deal of one of the most powerful animals with which they were acquainted, and should accord to it great consideration. All of the stories of the Indians have a somber cast, born in the dark forests wherein the Indians themselves lived, or of the solitudes of the vast prairies and mountains. The loneliness of some of the mountain ranges in the far West is appalling, and there is a stillness about them that is overpowering. I have felt this on several occasions.

In old times when Indians were not supplied with breech-loading rifles it was a good deal of a feat to kill a grizzly bear with a bow and arrow, and he was a brave man who would undertake it. It is no wonder then that one who had succeeded in killing a bear should take great pride in wearing a necklace made of its claws. This was a great achievement, as any one will see at a glance, and many a reputation for bravery was built upon it. When in full war gear this necklace was looked upon as the man's greatest treasure, and he felt proud of the distinction. When we know how dangerous it is, even now, for a man well armed to attack one of these animals, we can readily understand what unlimited nerve was required when poorly armed.

Hunters love to dwell upon the excellence of bear meat, that is, black bear meat. I cannot agree with them exactly as it is excessively fat and not particularly palatable. I presume after a man has lived on deer and elk meat for a considerable time almost any change is acceptable, but bear meat is not remarkably good. The first settlers in the wooded portions of the West welcomed anything in the shape of fresh meat, and the fact cannot be disguised that our pioneers nowadays suffer no such hardships as did those of twenty-five years ago, even. A bear was a godsend in those days, and the present of a portion of the meat something to be remembered. I know how it was treasured up in some instances, and what a nine days' wonder it then was. The fat was carefully stored away and was supposed to have wonderful virtues. Especially was bear's grease valued as a dressing for the hair. I believe this is changed somewhat nowadays; at all events we do not hear its virtues extolled on all sides.

Some enormous grizzlies are met with in the Rocky Mountain region, and some laughable stories are told of plucky men who have come face to face with them in dense thickets, when the men would take the back trail with wonderful celerity, leaving Bruin not only master of the field, but very much astonished to see how suddenly his newly made acquaintances had vanished from sight, and put as much room between them as possible.

Some years ago a young man from New York visited Wyoming territory, and took part in a hunt in the Wind River region. He went into a dense thicket, not knowing much about the danger he was in, when he was attacked by a tremendous grizzly, and if help had not reached him speedily, he would have been torn to pieces. As it was, he was so badly wounded that he never recovered from his injuries.

In the autumn the bears go into the thick brush in search of berries, of which they are very fond, and seizing a bush with their fore paws, that they can use almost as well as a man can his hands, they draw the bushes toward them and then strip off the berries with their teeth. Service-berries, haws, hull-berries, choke-cherries, and wild plums are devoured in this way with the greatest relish. Their tongues loll out with satisfaction, and their eyes seem to manifest perfect happiness. At this season Bruin becomes very fat, and is in good condition for the commencement of winter.

The remains found in the bone caves show that the bears of ancient times were exactly like the grizzlies of the present. These caves have been found in many localities, both in Europe and America, and prove the wide range of these animals in former times. Primitive men inhabited these caves before they had learned to build houses for themselves.

The female has two or three cubs at a litter, and it is fair to say that no little ones ever receive better attention from a parent. The she bear, when she has cubs, becomes absolutely beside herself with rage should anything come near her. Foxes and martens are always on the look-out for bears' cubs and sometimes find them. The martens always get away with their victims, but the foxes are frequently overtaken by the mother and then there is very little indeed left of Reynard. The ferocity of the bear under these circumstances is absolutely unbounded. Should man or beast come in her way she attacks without a moment's hesitation, and nearly always succeeds in doing great damage to her opponent.

The young bears are handsome little fellows, exceedingly playful and good natured. Their cry is something like that of a child, and might be mistaken for it. They grow rapidly, and a bear that is born early in the spring is able to take care of itself by the time the leaves fall from the trees. North America seems to be the natural home for Bruin, and there are three well-marked species found therein. South America has but one variety, *Ursus Ornatus*. But North America is their chosen land, and they will be found here for many years to come. The brown bear of Europe, *Ursus Arctos*, is the same as the Syrian bear, *Ursus Syriacus*, or nearly so, and is found scattered through Europe and Asia, and is the one mentioned in the Bible.

On the 18th of April, 1882, I saw a very fine specimen of grizzly bear at Cheyenne, Wyoming, that had been killed a day or two before at the head of Pole Creek, in the Black Hills of Wyoming, on the Laramie range of mountains. It was an exceedingly handsome animal, weighing something over three hundred pounds, and had come out in a fat condition. It was over a year old, I should think, most of the hair being of a glossy black, and over six inches in length. I was surprised to see how fat it was, and how well developed its claws were. There was considerable grey hair under the fore legs well up toward the body, in what was possibly its armpits, as well as about the head, which was broad, and remarkably well developed. In a few years more it would have been a tremendous fellow in point of size and strength. The man had no trouble about bringing it down, and did not consider that he had done much of a feat after all; the old hunters are a modest class of beings and content with little.

I have not heard of many bears being killed in Wyoming in 1881-82, though there are plenty through the whole mountain chains, reaching up from the Cordilleras of Mexico to the great plains of British Columbia.—*Col. Brackett in American Field.*

YACHTING.

CANOEING.—This sport has seen a wonderful growth in the past two years. There are now two thousand canoes of the "civilized" kind scattered throughout the country, and builders report a lively demand for the next season. The popularity of canoeing in America is not astonishing, if we recollect that our continent has facilities and attractions for the sport in all its branches far exceeding the opportunities to be found in European countries. J. H. Rushton, of Canton, N. Y., is working up $10,000 worth of stock for the spring trade. This will represent something like $30,000 in finished canoes. Thos. Kane & Co., of Chicago, are turning out by machinery a numerous fleet of their veneer canoes, which are sold to all parts of the country as fast as they can be supplied. Other builders are straining every nerve for the rush of the season, all of which is evidence of the rapid spread of a fondness for this most charming, robust and romantic method of vagabondizing with benefit to the body and mind. It is probable that three canoes are turned out in America for every one set afloat in Great Britain. America is the natural home of the canoeist.—*Forest and Stream.*

NEW SINGLE HAND YAWL.—Mr. Thomas Clapham, of Roslyn, L. I., is building a single hand yacht of the sharpis pattern for owners on Lake Erie. Her model will be of the Nonpareil kind, 25ft. over all, 6ft. beam, and 3ft. deep. She will have a keel 24in. deep, the lower 12in. of which is hung by bolts from the inside, so that it can be cast off in case of necessity or for use in shoal water. Cabin 11ft. long, two berths and lockers, as well as regular cruising fittings. She will be rigged as a yawl, a style now becoming very popular. Cost $325.

A sportsmen's club has been organized at Nelson, Butte county. It contains some good shots.

THE RIFLE.

A Fizzle.

A few weeks ago a ripple disturbed the placid, almost stagnant stream of shooting items in shape of e novel match that wes to take plece last Sunday between Mr. Linville and Mr. Brazille. Sportsmen were very much iuterested hecause the match was for money as well as being a novelty. One hundred dollars a side was the purse with $30 forfeit. The conditions were: The rifle, twenty-five shots et 200 yards; the pistol, tweuty-five shots at 33⅓ yards, and the shot gun, twenty-five pigeons at 21 yards rise, eech dead bird to count five points. The preparations were made and everything went on hooming up to a day or two previous to the time set for the match to come off when Mr. Brazille very unexpectedly handed over his $30 forfeit money and of course the match was declared off. Mr. B. gives as the reeson for his so doing that he has not been ahle to practice and was not in coudition for the match; he also darkly hints that a similar match will take place in the future, but he mekes no mention as to the time. No doubt Mr. B. does need practice, for his opponent is quite handy with firearms. It is to be hoped that a match of this kind will be shot before long and the next time it is to be hoped that $100 will be lost or won instead of $30 and no "hack out."

At Shell Mound.

At the popular shooting range—Shell Mound—last Sunday, Messrs. O. Lemke, L. Haake, Lient. H. J. Mengels and C. Scheurer made np a purse of $5 a corner and shot a match of 40 shots for the ssme at 200 yards. All of these are military men and they used the U. S. Springfield. The dey was fine, the etmosphere cleer and light good; there was but little wind and the bullseye showed np very distinctly. Mangels being on tbe sick list did not do as well as nsual. Following are the scores:

Lemke	4 3 4 4 4 4 4 4 4 5—40 4 4 4 4 5 5 4 4 4 5—43 5 5 4 5 4 4 5 4 4 4—44 5 4 4 5 5 4 5 5 4 4—45	
Total		172

Total		209

Mr. McElhinney nsed a Sharps-Borchard rifle and Mr. Hook a Hotchkiss.

National Rifle Association.

At a meeting of the National Rifle Association on Dec. 28, Secretary Seahury snbmitted the following report in relation to the international military match to take place in England next year: The return match will take place in the latter part of Jnly dnring the fall meeting of the National Rifle Association of Great Britain at Wimbledon in 1883. The team to represent the National Gnard of the United States will be chosen some time in the latter part of May in a general competition held for that purpose. Twelve men and two reserves will be selected by tbe Board of Directors of the National Rifle Association from those making the highest scoree, due allowances being made for previous ability and record. The special committe recommend to competitors the Brown military rifle (new model) as approved and the Sharp Borchard. The committee, however, are charged to continue their investigation until a weapon is produced which shall represent the highest possible shooting capacity eqnal or superior to those recommended for practice prior to the match. Early in January the National Rifle Association will issue to the National Gnard of America a circular giving valuable information connected with ammunition, loading, lubricants, bullets, powder, shells and kindred topics. The final competitiou for places on the team will be held some time dnring the latter part of May. Tbis competition will be opened only to properly qualified competitors who have made at least three complete scores of 165 out of a possible 205 at the six distances prescribed in the conditions of the international military match, 85 or over at 200, 500 and 600 yards, and 80 or over at 800, 900 and 1,000 yards. The adjutant generals of the various states will undoubtedly offer a State prize to all who succeed in winning a place on the Wimbledon team.—*New York Clipper.*

The crack rifle shots of the npper Sacramento are engeged in a wordy newspaper banter and the result promises to be a match between teams from Colnsa and Tehama counties.

The Sierra Nevada ladies are expert with the rifle, and had a shooting match the other day, in which some fine exhibitions of ekill were shown.

ANCIENT AND MODERN ARMS.

Turn of the Rifling and Rotation of the Bullet Compared to the Flight of an Arrow.

BY DR. E. H. FARDEE.

(*Continued from page* 12.)

I have almost forgotten where I closed my last communnication, hut I think it wes on a screw bullet, in the illustration of the profound ignorance prevailing on the subject of gunnery. The article was based on the turu of the rifling and the rotation of the bullet in its passage throught the air; I also referred to the arrow, refuting the error so commouly entertained by many people of the analogy between the elongated bullet and the arrow.

Elongated shots when fired from a rifle have the defects of the shot, as described in my previous communication, remedied by having a rotery motion imparted to them in the first instance, and this rotary motion of the bullet is continued until it is overcome by continuons action of the atmosphere. Thus a proper degree of stahility is imparted to the shot, and when fired with a sufficient degree of velocity, they can be managed to a very close mathematical result; and even if fired with a higher velocity, the velocity of their revolution being in proportion to tbet of their given flight, is sufficient to secure steadiness of motion, resulting in a sameness in each shot. If, however, they are lired with too great a velocity, they also will have an irregular flight, but not attributable to the same cause which produces unsteadiness of the arrow.

Therefore it will be seen that the striking difference between the bullet and the errow is, in addition to what I heve given in my last communication, thet the bullet receives the rotation from the same power that gives it its projectile velocity, and when freed from its confinement in the gun, and coming in the open and nnconfined air, tbe atmospheric resistence is et work to teke this roteting motion away, and the time necessary for the accomplishment will depend wholly upon the amount of spirosity the shot hes imparted to it at the instant of its departure from the muzzle of the rifle. The more rotation it hes, the longer it will teke the atmospheric friction to overcome this second motion, leaving the shot, as soon as it is accomplished, et the mercy of the atmosphere, when it will commence a gyrating motion, end when the projectile velocity is epent, or when the shot may strike after the rotary motion is lost, you will be moet sure to find what targetmen call a "key-hole" for the bullet-hole.

The errow sterts straight from the bow and the verticel swing sometimes seen in an arrow is generally owing to the propelling force not passing directly through the center of grevity; for if the vigor and force of the erober's arm be great, and the ehaft of the arrow be a little frail, a vibreting motion in the middle of the arrow will take place, that will give it an unsteady motion in its flight. This unsteady motion may also be prodnced from the fact that the arrow is not properly balanced, or feathered; therefore the steadiness of an arrow depends wholly upon the perfect adjustment of its parts, and should the feathers be placed in an oblique position to the line of the arrow, the second motion of the shaft will take place, causing a slow rotation of the arrow in its flight, hut greatly at the expense of the projectile velocity, resulting always in a slow velocity and a high trajectory.

It must be beyond dispute that a shot should be caused to remain a tangent to the course of flight; hut this can only be effected in practice, as a rule, by placing the center of gravity in the head of the shot, aud then the theory mnst hold good that the rotary velocity being proportionate, the axis will be disturbed in a manner also the least likely to affect the accuracy of the projectile when the center of gravity is in the forward position, since the forepart of a projectile so constructed, owing to the smaller curve which it will describe about the direction of flight, that it would not be so liable to acquire so greet an inclination to the vertical plane.

Let us reverse this system of reasoning and place the center of gravity behind, or toward the rear of the ahot; the curve will then be described about an axis parallel, or nearly so, to the direction of projection; and when in the front of the bullet, it must be about an axis, which describes a true tangent to its course of flight, which demonstrates by a parity of reasoning that the atmospheric disturbance, in the latter case, will be greatly reduced.

Theretore from this standpoint it may be seen that the stability of a long projectile (as I have intimated in some former communications) of a given diameter is greatly diminished by an iucrease in its length, and therefore that it must require a greater rotary velocity tban one of shorter length to keep it etraight. This is surely in accordance with all mechanical laws, for the greater the length of a body, in proportion to its diameter, the more unsteady will be its equilibrium; that is, a smaller amonnt of force will be necessary to disturb it in ite flight. Thus in tbe spinning of two tops of the same diameter, one of the two being three times the length of the other, it will be easily seen that the larger top must require the greater rotary velocity to keep it spinning, end preserve its equilibrium; but the schoolboy will say, when the equilibrium becomes once disturbed tbe movement about its smaller axis will be less rapid than the movement made by the shorter, all under similar circumstances.

Therefore it must be sound logic to advance that rifles with different turne, and of the same caliber, must require different lengths of projectiles, in order to acquire the best possible performauce from the gun.

Experiments have estahlieshed a theory with me, that a velocity of rotation which is sufficient to keep the flight of a shot true for a given range will be quite insufficient for the purpose when the elevation is increased, for when the elevation of a gun ie fixed for one thousand yards, and tho time of the shot increased, the necessity of a greater turn will be called for in the grooves, in order to secnre sufficient velocity of rotation throughout tbe fligbt of the shot to keep it epinning on its axis; tberefore the rifle that will impart to the shot sufficient rotary velocity for good and steady performance at five hundred yards, wonld be worthless at double that distance, or one thousand yards. Therefore the short-range gun has a slow twist, tho mid-range a quicker turn, and the long-range a still more rapid turn of the riflings.

All the turn that is necessary is to impert a sufficient rotsry motion to the shot for the distance intended by the marksman, and any increased rotary motion beyond this is a useless expenditure of means, and I feel quite confident that the time is not far distant when an epportionment will be egreed upon for the proper amount of twist the rifle will have for classified distances. Then all a man will be compelled to do in the purchase of a rifle will be to ask for a classified rifle from No. 1 up to No. 20, No. 1 indicatiug one hundred yards, No. 2 two hundred yards, and so on, up to two thousand yards, with a lot of prepared ammunition fitting the condition of the rifle for its respective distance, and the purchaser will he sure of having a dead thing for a specified distance at least.

I think men are beginning to see the importance of having rifles possessing different turns of the grooves for different distances, and when I say for ammunition to fit the condition of the rifle, I mean the length of the bullet, whetber pure or tempered lead, the shape and general contour of the shot, its weight, how much cylindro, and how much conoid, if swaged, witb cloth or paper patching, or with cauelures, with what kind of lubrication if any; with what kind of granulated powder, and by what maker. In short, the result of a long series of experiments, carefully noting down each by itself until you arrive at something satisfactory, and then adoptit, and prepare the ammunition for tbst gun from the selection of your findings, and you can depend on steady performance from that gun, for its classified distance.

Well do I remember thirty-five years ago, the turn of the grooves in the old Hawkins rifle, whose performance at 100 yards wes good with a quarter turn in a harrel 36 inches long; but when compared with the increase twist, as introduced by Edmond Wesson of Roxbury near Boston, for all distances beyond 100 yards, it was not deuce high.

Abont the best target that could be made at the distance of 220 yards, before the introdnction of tbe more rapid and increased turn by Mr. Wesson, was twenty-five to thirty inches, string measure from center of ball-hole to center of bullseye, ten shots. Soon after the adoption of a more rapid end gain twist, as started by Mr. Wesson, a competition began between Mr. Wesson, with Clark's patent muzzle, and Morgan James, a celebrated gunmaker et Utica, N. Y., whose inventive genius first applied and adjusted the telescope to the rifle, end Wm. Billinghurst of Rochester, N. Y., who took the lead as gunmakers in the United States, and I think I am sefe in seying they had no superiors in the world.

With rifles of their make a ten-shot string was reduced at the above-named distance (220 yards) to from nine to fifteen inches—et least a redncton of one-half in the length of the string. These three men gave an impetus to target-shooting end rifle clubs sprang up all over the middle, and New England States, end it wes difficult for these three gunmakers to fill the orders for their guns, so great beceme the demand for first-class target rifles.

This spirit of emuletion in terget practice began about the years 1841-42, and telescopic rifle clubs became so fashionable that even ladies ofteu participated in the sport. Soon the latent geniuses of other makers became the rivals, and peers of those already named, and each maker hed his devoted friends advocating the claims of the respective makers. And I do not feel like letting this opportunity pass without referring to one who for his genius, his intellectnal attainments, with e mind stored with a versatility of mechanical ingenuity, though modest beyond all of his competitors, was put forward by his friends, until the hendiwork of his stored-up genius brought him to the front rank, as the American telescope target rifle-maker of the world. For two-score years the name of George H. Ferris of Utica, N. Y., was a familiar word with all the devotees of target-shooting in the United States. He was a philosopher, and trusted to chance for nothing; he became conversant with the fundamental principles of gunnery, and when his competitors were content with the fruit of their day's labor, and snored off the stilly hours of night, George H. Ferris could be seen in front of his coal-oil lamp wrestling with some knotty problem that was not clear to him in the laws of gunnery. His celebrated match of forty successive shots with Morgan James, in 1855, now nearly thirty years ago, will never be forgotten. Forty shots at 220 yards measuring 55⅜ inches—only think, nearly a third of a century ago! True, it has been beaten, but by only a few, and those only who have familiarized themselves with the science and laws of gunnery. The name of George H. Ferris will stand, in the minds of the American people, as the intellectual champion rifle-maker for a quarter of a century, for ages to come. The record made by his guns cannot be effaced. I will in some future communication refer to some of the wonderful performances his rifles have made.

I will now return to the subject and see if a gun of a given caliber with a different velocity of projection would, and if so how, affect the turn; and if we carefully examine the causes which exist for giving to the shot a rotary velocity, we will see that, the rotary movement being the result of spiral grooves in the bore, the velocity of projection will not necessarily affect the turn, as one might at first suppose, providing suitable turn of the rifling be duly considered in the first instance; for it must hold good with all mechanical laws that govern the compound motion given to moving objects that the velocity of rotation is always in exact proportion to the projectile velocity; and although the resistance of the air increases in a higher ratio than the velocity, yet, with any increase in the velocity of the projection the *vis viva* of rotation increases in the same proportion as the pressure of the air, therefore the same turn must always take place to keep the shot steady and true. Still I find that circumstances may occur in practice when nearly as great a turn may be required for a low as for a high projectile velocity, and if I do not forget I will tell you how in my next.

Stock Sales.

Hancock Johnson of Ela Hill's stock farm, Los Angeles county, has lately made the following sales:

Thoroughbreds—To Don M. A. Forster, San Juan Capistrano, ch s Griffin, by Grinstead, dam Lulu Jackson by Jack Malone.

To Charles A. Paige of Arizona, stallion Dan Rice, by Wildidle, dam Moute Bello by Ten Broeck.

Trotters—To Don M. A. Forster b c Frank Wood, by A. W. Richmond, dam Aeme by Emperor; second dam Lady Thompson by Warner's Tinstee.

To Don Francisco Pico, b c Joe Blackburn, by A. W. Richmond, dam Lady Thompson by Warner's Trustee.

To J. W. Waters Jr., of San Bernardino, blk c, by A. W. Richmond, dam Miss Rowland; also g c, by A. W. Richmond, dam Silver Dollar by Silver Threads.

To N. A. Covarrubias, g g Tom Mott, by A. W. Richmond, dam Pride of Kentucky by imported Albion.

To Charles A. Paige, Arizona, blk c Royal [illegible] by A. W. Richmond, dam Monte Bello by Ten B[illegible]

(Concluded from page 33.)

wrong, while those on either side of the hackbone are so immense that there is a deep cavity between them, and they are of a hulk that we never saw equaled. He is a tremendous horse all over. Around the heart, in the swell of the back ribs, shoulders, arms, neck at the base, there is size, a strength evident to those who are not versed in the structure of the racehorse, and which conveys the impression of almost unlimited power.

His head is of medium size, nicely poised, as his neck tapers to the point of junction, and the eye is full and expressive. The countenance indicates a good disposition, notwithstanding the obstinacy he displayed when he was started in races. This obstinacy undoubtedly arose from improper management when a two-year-old, and different treatment from what was then awarded would have resulted in one of the greatest racehorses that ever wore plates.

We write knowingly, being in a situation to see what was done with him at that period of his life. He was then owned by Wilbur Pierce who at that time was training for John Hall, and the colt was neglected. He ran in a field most of the time, and was exercised occasionally by a little boy. He would carry the boy quietly to the road at the end of the lane, and then wheel and come home with the speed of an eagle. Attempting this with an older rider he was unmercifully punished, raising a temper which rebelled, and the colt which would have been easily controlled by kindness was spoiled. His speed was almost fabulous. He could close a gap between him and ordinarily fast horses so rapidly as to make the others look as though they had quit, and his action was graceful for all there was so much power shown. It is scarcely necessary to dilate further on his appearance as the cut gives his exact form, further than to say that he is sixteen hands, and in color a bright chestnut with the white markings as shown. He is a "striking" horse as the portrait gives proof.

We have looked at him again and again, and yet there is an attraction that invariably draws to his stall or paddock at every opportunity.

It may be that this favoritism warps our judgment, though if we were breeding thoroughbreds on a scale which would warrant keeping a sire of high stamp we would be satisfied with this fellow, white markings and all, and not look further. Of still greater importance than form is the blood, and in this respect he comes up to the standard.

After the fashion of the Stud Books the pedigree will stand thus:

Joe Hooker.

Chestnut horse, foaled 1872; bred by A. Mailliard, Marin County, California.

BY MONDAY.

First dam, Mayflower, by imported Eclipse.
Second dam, Hennie Farrow, by imported Shamrock.
Third dam, Ida, by imported Belshazzer.
Fourth dam, Gamma's dam (Mad. Bosley), by Sir Richard.
Fifth dam, by imported Eagle.
Sixth dam, Bet Bosley, by Wilkes' Wonder.
Seventh dam, by Chanticleer.
Eighth dam, by imported Stirling.
Ninth dam, by Clodius.
Tenth dam, by imported Silvereye.
Eleventh dam, by imported Jolly Roger.
Twelth dam, by Partner.
Thirteenth dam, by imported Monkey.
Fourteenth dam, imported mare from stud of Harrison, of Brandon.

To those who are well up in the genealogy of racehorses this is sufficient but it does not tell the whole story only to the few. It is a rare combination of the best blood, Monday by Colton, his dam Mollie Jackson by Vandal, and the second dam Emma Wright by imported Margrave. Colton by Lexington, his dam Topaz by imported Glencoe, second dam Emerald by imported Leviathan, and the third the imported mare, Eliza by Reuben. Imported Eclipse by Orlando, his dam Gaze by Bay Middleton, second dam Flycatcher by Godolphin, and the third the sister to Cobweb by Phantom. This is one of the best pedigrees in either country, and the descendants of Prunella by Highflyer have been the star performers of nearly every era. Orlando was by Touchstone from Vulture by Langar. Then the second dam of Joe Hooker is Hennie Farrow, the dam of Privateer, Shannon, Mollie McCarthy, Ralston, Flood, Electra, etc.; Mayflower was also the dam of California and Warwick. The sire of Hennie Farrow was imported Shamrock and her dam Ida by imported Belshazzer.

To present a little of the claims these animals have would require chapters, and these condensed into so little space as would not do justice to their merits, embracing so many of the late celebrities on the turf and in the stud, and these backed by the stoutest and speediest of the oldtime strains. When Mr. Winters first got Hooker he bred him to four mares and sent him to his ranch in the upper country. Every one of these colts could run, and as has been stated before there never was one of his colts trained that had not a fine turn of speed. Jim Renwick, from Big Gun, a mare with no pretensions to breeding, save a dash of the Oregon quarter-horse strains, ran three-quarters of a mile in 1:15. That he could accomplish thirteen hundred and twenty yards was to be expected but when called upon to go 1½ miles it was reasonably supposed that the distance was too far for any horse of as little breeding on the side of his dam, and the betting before the race started was $20 on Euchre to $6 on Renwick. There was an incident in this race which was very amusing. A couple sat in the club stand only a short distance from the reporters. The man stated that as it was Thanksgiving Day he must have some amusement, and in addition to anything else offering he would buy a pool. "What horse are you going to buy?" was the query of his wife. "The little one," was the reply. "Buy the big one," she responded, "he is sure to win". After some further parley, the man offering the argument that the odds was an indication of how the money should be invested, he finally made the proposition that he would do as she directed provided she paid the loss which in his opinion was inevitable. "Very well," she said, "if the big horse does not win I will go without the new hat you promised to buy me." There was never a race more closely scanned than the sanguine wife watched Renwick, and when Euchre led until well into the homestretch there was a despondent visage under the hat which she doubtless thought was the only headgear she would wear for a time. The big horse was given his head. In a few strides he was level with Euchre, a few more and he had passed him. Never were cheers more enthusiastically given, and intense exultation was as promptly portrayed as could be. He galloped across the winning score with his ears playing in the very good time of 1:58½, and on that day it appeared as though he could have reduced the time several seconds.

Fred Collier has again and again shown that he was a good race horse, and has run from one to three miles in fine time.

There are yearlings by Joe Hooker now on Mr. Winter's place which can scarcely fail to place him in the rank we feel so confident that he will be awarded in a few years, and to fulfill our predictions that rank must be very high.

THE STAGE.

Since the opening of the new year the season at our prominent places of amusement has been of a remunerative character, showing that with a certain tact in catering for the taste of our pleasure seekers, and with enterprise and liberality in carrying out the managerial views. San Francisco can support three or four first-class theaters together with the houses devoted to operatic entertainments at popular prices. The theater outlook is indeed of a promising character both as regard the novelties that are to be produced in rapid succession at the various establishments, as also to the patronage that is likely to be extended to these amusements. Indeed the coming season promises to be one of the most brilliant on record owing to the increase of visitors to our resorts, attracted by the conclave of Knight Templars, as also by the number of excursionists who prefer a visit to California rather than the usual European trip. There is no city in the country that, for the number of its inhabitants, possesses such elegant theaters as San Francisco and when they are managed in a liberal and judicious basis they will yield an even increasing return on the capital invested. The reason for the statement is easily to be found in the number of theaters that are now in operation, or are being built on the two lines of railroad, in the interior of the State, and in the prosperous cities of Oregon and Washington Territory. Companies that some two years since would be brought direct to this city from Chicago and then return by the same route, playing a night or two in Sacramento and Virginia City, can now find profitable stands by which the heavy costs of transportation are greatly diminished and the services of the people can be realized to better advantage. The recent successful trips of the Palmer-Burt dramatic company has proved conclusively that with good attractions, these towns will in the future be a remunerative field for the enterprise of our different managers, and that they will not as in the past, be obliged to rely solely on San Francisco for the success of their ventures.

With the revival of "Michael Strogoff" with its fine dramatic action and spectacular effects, the California Theater has been so well patronized that it is likely to be kept on the boards until Madam Ellmenreich commences her engagement, making her debut, on the American stage. The company is very well balanced and is worthy of one of the best theaters in the country, and the only regret that is generally felt is, that Miss Georgie Cayvan is about to leave us without having had the chance of showing her unusual dramatic talent to the best advantage. She has become a great favorite here, and when she returns, we hope that she will have some plan in which she may make a mark that will lead to her becoming a Stellar attraction.

Madame Ellmenreich opens on the 5th of February, and she will play two weeks, her repertoire consisting of Adrienne Lecouvreur, Camille and Marie Stuart, and there is no doubt but that she will meet a most cordial reception. In the round of characters in which this gifted artiste has recently appeared on the German stage, she has shown an unusual amount of histrionic versatility, and if, as it is alleged, her accent betrays but a very slight foreign inflection, then she can emulate, or even surpass the success achieved by Madame Modjeska, who made her debut on the same boards. The chief drawback to such a result is that the dramas in which she is to appear are so well known that the zest of novelty is almost entirely lacking save in comparison with the previous production of the same plays. One would imagine that in her varied repertoire in the German drama she could find one favorite part that she could get adapted for her special use. Odette would have suited her talents admirably well, but it is likely that the American rights to that play have been purchased from Augustin Daly for Madame Modjeska. In any case, the debut of Madame Ellmenreich will be one of the brilliant attractions of the season.

The return of the Frohmans to the Baldwin Theater will be welcomed in a very enthusiastic manner, and the proof is that the house was all sold for the first night on Monday next, within a few hours of the opening of the box office. Considerable alterations and improvements will be made in the theater and as in the past we expect to see the management more than fulfil every promise made as to the superior manner in which every play will be produced in their handsome establishment. The Mallory Brothers seem to possess an intuitive talent of surrounding themselves with a corps of efficient aids who are devoted in their efforts to meet the public wishes in every regard, and this is why they achieve such popularity wherever they appear. The opening attractions will be "Esmerelda," a drama that in the opinion of many good judges surpasses the ever popular "Hazel Kirke" in dialogues and incidents, and on its presentation will appear the principal members of the home Madison Square theater who have achieved a great repute in their several characters. Monday will be a gala night in the Baldwin, and we hope will form the commencement of a long and prosperous season.

At the Grand Opera House Messrs. Andrews and Stockwell have found in "Youth" a prize drama, that, with its grand scenic displays and well-sustained interest, still continues to attract large and delighted audiences. The next novelty will be a spectacular comedy entitled "Chaff," and then for a short period "Kentuck" will be revived, and it is said with the most thrilling realistic effects, including a race between thoroughbreds that will tax the ingenuity of the stage management to produce to the best advantage. The lessees are well pleased thus far with the cordial reception that their efforts have been met with, and several novelties are now in preparation that will ensure to this establishment the same popularity as achieved by the Grand Opera House in New York.

At the Bush Street Theater this is the last week of M. B. Leavitt's all star specialty company, and on Monday next Rice's Surprise Party appears in a new and highly sensational, melodramatic, operatic comedy melange entitled "Pop," by George Fawcett Rowe. This style of entertainment has always been popular here, and if the play is acceptable and the members of the company are as talented as their predecessors in the same organization, Mr. Alfred Hayman can count on a long and successful run in the pretty theater so admirably adapted to this style of entertainment.

Emerson's Minstrels continue to hold their own in the popular estimation, and increasing efforts are made to infuse novelty in their programme. The chief attraction for the coming week are Johnson and Power, who, as Song and Dance artists, have gained a great repute in New York, where they were for a long time members of the celebrated Birch and Backus Minstrels. It is almost impossible for one who is not acquainted with the profession to estimate the difficulties of procuring new scenes and attractions for a minstrel troupe and the success made thus far by Emerson and Reed in this respect augurs well for the future of this cosy little establishment.

The gardens are doing a good business, "La Traviata" forming the attraction at the Tivoli, and produced in a complete manner as will keep this charming opera in the programme for weeks to come. Of this production we shall write more fully in our next issue, but in the meantime we cannot praise to highly the manner in which Gustav Heinrichs manages his orchestra and chorus, and that with an ensemble that adds so greatly to the beauty of this charming work.

At the Winter Garden we are promised the first production of Gilbert & Sullivan's most recent opera "Iolanthe" that is now running to immense business both in London and New York.

There will be great interest taken in this presentation of esthetic burlesque, and we shall soon have an addition to the many popular melodies that this ingenious writer and clever composer have stamped with their talent. Such works as "Patience," "Pinafore" and the "Pirates of Penzance" will continue in popularity when much more pretentious works will be forgotten. We hope that Iolanthe will score a great success.

Violations of Game Laws.

J. A. A. Robinson writes the following concerning violations of the game law, to the *Calistogian:* It is known that certain parties in this vicinity in open violation of the game laws in this State continue to hunt and kill deer. It may not be generally known that the fine is a severe one, no less than $500 ($250 of which goes to the State, and $250 to the informer) for any one convicted of killing deer during the close season. Parties have come to me during my stay here in Calistoga asking me if the Sportsman's Association would act with them in helping to bring to punishment men caught in slaying deer at this season, and I have promised as a member of that association to bring the matter before it, also to notify the Sportsman's Club of Napa county, whose members undoubtedly would act at once to suppress any further violation of the law by these parties, who are known to make a practice nearly every Sunday, since the close of the season, of running and killing deer. The deer are now with young, and have their fawns in March, and it is cruelty to run these animals now with hounds, even if they are not shot when found. I am sure every thorough sportsman, and men who have any feeling for the poor brutes will unite both in Calistoga and throughout this section, in arresting the proper persons to prevent a continuation of this evil practice.

Checker Match Off.—The match at checkers for $25 a side between H. O. Brown and D. Buckley of Stockton has been declared off and the forfeit money drawn. The reason was that some of the relatives of Mr. Brown objected to his playing a match on which money was bet, although he had nothing to do with the betting and was not financially interested in the result, and was to play only to oblige a friend.

The next Bremen steamer due at New York to-day will bring some 300 English pheasants, ordered abroad. Pierre Lorillard has engaged 100 of them to stock the preserves of his estate. The consignee says he could get plenty of Southern quail, or beautiful plumed California quail, but he has already tried both and found that they do not do so well in Europe as our ordinary quail.

It is said that there has not been seen any time this winter as many canvasbacks as have come into the ponds in Suisun marshes last week. Several very good bags were made last Sunday, and the boys who did not go up to Cordelia or Teal are sorry they stayed at home and missed the "shoot of the season."

The New Years number of the Breeder and Sportsman, published at San Francisco, presents a fine appearance and contains much reading matter of interest to sportsmen. It is accompanied with a neat engraving entitled "Boys in Trouble."—*Corvallis (Or.) Leader.*

The Cordelia Shooting Club lost several boats and a lot of decoys just as the season opened, from their preserves at Suisun marsh. They had to get new boats and new decoys. Now, however, the thieves have been caught and some of the property recovered.

There are literally millions of white geese up on the Suisun marshes. They are very poor eating and are seldom shot at, so they grow fat and prosper. They seem to drive away the ducks though, and both farmers and hunters are annoyed with them.

Captain Chittenden, who has been in charge of the Cordelia Club's grounds this winter, was in town this week for a day or two, but has returned to the Suisun marshes.

Canvasbacks still seem quite plentiful in the broad San Francisco and San Pablo bays.

He Wins His Races.

ALLSTON, MASS.—Mr. J. J. Bowen, the well known expert handler of trotters, whose valuable racing stallion was mysteriously attacked with severe lameness, gives the following to the public: After our most experienced veterinary surgeon had him in treatment for a long time, without benefiting the horse, I resorted to St. Jacobs Oil, applying the same thoroughly. I am pleased to say the animal has entirely recovered, and is as well and sound as ever. As a pain-cure, St. Jacobs Oil is superior to everything that has come under my notice in an experience of thirty years. Mr. Bowen is one of the men who drive to win.

Coughs, Colds, Hoarseness, Sore Throat, etc., quickly relieved by BROWN'S BRONCHIAL TROCHES. A simple and effectual remedy, superior to all other articles for the same purpose. *Sold only in boxes.* Price 25 cts.

Market Report.

FLOUR—We quote: Best City Extra, $5 75@$5 80; Superfine, $5@$5 25; Interior Extra, $4 75@$5 25; Interior Superfine, $3 75@$4 ₱ bbl.

WHEAT—Holders are asking $1 82½ for No. 1 and $1 81¼ for No. 2 quality. Recent sales are mostly on March delivery. No. 1, White March, $1 85½ and $1 85¼, do.

BARLEY—New transactions of large quantities have taken place the last of this week. Recent sales are No. 1 Feed, Spot, $1 21 do March, $1 22½. No. 1 Brewing, $1 32½ offered, and $1 27½ ₱ ctl. bid.

OATS—Fair Feed, $1 70@$1 75; Good, $1 75@ $1 82½; Choice, $1 85@$1 95 ₱ ctl.

RYE—Business dull. Quotable at $1 65@$1 75 for fair to good.

FEED—Ground Barley, $28@$29 ₱ ton; Cracked Corn, $35 ₱ ton; Shorts, $17@$19 ₱ ton; Oilcake meal the oilworks sell to the trade at $1 35 ₱ ton, less the usual discount; Middlings, $28@$24 ₱ ton for lots at the mill.

HAY—Alfalfa, $13@$14 60; Wheat, $15@$17 Wild Oat, $14 50@$16 50; Mixed, $11@$13 ₱ ton.

PROVISIONS—Eastern Hams, 18¾@19½c; California Hams, 15¾@16c for plain, 15¾@16c for sugar-cured canvased; Eastern Breakfast Bacon, 16½@17c; California Smoked Bacon 14½@15c for heavy and medium, and 15¾@16½c for light and extra light; Clear Sides, 15@15½c; Pork, $20@$21 for Extra Prime, $23 50 @24 for Prime Mess, $25 50@26 for Mess, $26 50 for clear and $27@27 50 for extra Clear; Pigs' Feet, $16@ $18 ₱ bbl; Mess beef, $16 for bbls and $8 50 for hf bbls; Extra Mess Beef, $17 for bbls and $8 75 for half bls; Family Beef, $18@18 60 ₱ bbl; California Smoked Beef, 13½@14c ₱ lb.

FRUIT—We quote: Apples, 30@50c for common and 75c@$1 25 ₱ bx for good; Lemons, $6@$7 per box for Sicily; California Lemons, $2 50 per box; Limes, $9@$10 per box for Mexican; Bananas, $1 50@$3 ₱ bunch; Mexican Oranges, $20@ $30 ₱ thousand; California, $2 50 @$4 ₱ box; Pineapples, $8@$9 ₱ doz. New crop Western Cranberries are offering at $15@$17 ₱ bbl.

VEGETABLES—We quote: Marrowfat Squash, $5 @$8 ₱ ton; Carrots, 30@50c; Turnips, 75c@$1; Cauliflower, 75c@$1 ₱ dozen; Cabbage, 75c@$1 ₱ ctl; Garlic, 3½c ₱ lb; Celery, 50c ₱ doz; Mushrooms, 6@8c per lb; Dried Okra, 20@30c; Dry Peppers, 10@15c ₱ lb; New Pototatoes 3@4c; Green Peas, 10c Green Peppers, 8c per lb.

POTATOES—River Red, 70@85c; Early Rose, 75c @95; Tomales and Petaluma, $1@$1 10 ₱ ctl.

ONIONS—Choice, $1@$1 12½; Good, 75@90c ₱ ctl.

BEANS—Bayos $4@$4 25; Butter, $3@$3 25 for small and $3 20@$3 30 for large; Lima, $3 25@$3 37½; Pea, $3 25@$3 37½; Pink, $3 25@$3 50; Red, $3 25@$3 50; small White, $3 25@$3 37½; large White, $2 75@$3 ₱ ctl.

BUTTER—We quote jobbing lots: Fancy, 26½@27c; choice, 25@26; fair to good, 22@24c; inferior lots from country stores, 17@20c; firkin, 25@26c for good to choice, and 20@23c for ordinary; pickled roll, 22½@24; Eastern, 18@22c ₱ lb.

CHEESE—Firm. California, 14@15c for choice; 11@13 for fair to good; do, factory, in boxes, 14@ 16c; Eastern, 16@17c.

EGGS—California, 42@43c ₱ doz.

POULTRY—Live Turkeys, gobblers, 16@18c; do Hens, 16@18c; do dressed, 18@21c; Roosters, $6@ $6 50 for old and $6 50@$7 50 for young; Hens $6 @$7; Broilers, $6@$6 50, according to size; Ducks $10@$12 ₱ dozen; Geese, $2@$2 50 ₱ pair.

GAME—Supply and demand well balanced. Quail, 87½c@$1 ₱ doz; Mallard Ducks, $2 26@$2 50; Sprigs, $1 37½@$1 50; Canvasback, $2 50@$3; Brandt, $1 25@ 1 50; Gray Geese $2 60@$3; White Geese, $1 25@$1 50; Honkers, $4@$4 50; Snipe, $1 75@$2 for English and 50@75c for common; Teal, 75c@$1; Widgeon, $1@$1 25; Hare, $1 75@$2 25; Rabbits, $1 25@ $1 75.

WOOL—Moderately active at former rates. We quote fall: San Joaquin and coast, 8@12c; San Joaquin and coast Lamb, good, 9@11c; Northern Fall, free, 15@20c; Northern Fall, defective, 11@14c; Northern fall, Lamb, 15@19c; free Mountain, 11@15c. Eastern Oregon, 18@23c; Valley Oregon, 22@26c. We quote spring California ₱ lb 14@20c.

HIDES AND SKINS—Dry hides, usual selection, 18½@19c ₱ lb; culls one third less, and Mexican Hides 1c ₱ lb less. Dry Kip, 18½@19c; Dry Calf, 19@21c; Salted Steers, over 55 lbs, 11c ₱ lb; Steers and Cows, medium, 10c; light do, 9c; Salted Kip, 15 to 30 lbs. 11c; Salted Calf, 14@15c ₱ lb; Salted Veal, 12½ @15c; Sheep Skins, 25@30c for Shearlings; 30 @50c for short, 60@90c for medium, and $1@$1 35 apeice for long wool and wool skins. Butchertown Green Skins bring higher prices.

TALLOW—Quotable at 7½c@8½c ₱ lb for rendered and 11@12c for refined, both in shipping order.

MEATS—Following are rates for whole carcasses from slaughterers to dealers:

BEEF—Prime, 9@10c; medium grade, 7½@8c; inferior, 5½@6½c ₱ lb.

VEAL—Large Calves, 8@9c; small ones, 9@10c ₱ lb.

MUTTON—Wethers are quotable at 5½@6c and Ewes at 5@5½c ₱ lb, according to quality.

LAMB—Quotable at 6½@7c ₱ lb.

PORK—Live Hogs, 6¾@6⅞c for hard and 5¾c@6¼ for soft; dressed do 9@9½c ₱ lb for hard grain hogs.

HAMBLETONIAN TROTTING STALLION

BOB MASON

By Echo. His Dam Belle Mason by Belmont, Thoroughbred.

Echo by Rysdyk's Hambletonian, his dam Fanny Felter by Magnolia (by American Star). Belle Mason by Belmont (Williamson's); First dam Lucy Johnson by the Pony (son of Imported Leviathan); second dam Catalpa, by Frank; third dam by John Richards.

WILL MAKE THE ENSUING SEASON, LIMITED TO TWENTY MARES, COMMENCING February 15, 1883, and ending January 15, 1883, at the stables of his owner, Figueroa street, Los Angeles.

Description.

BOB MASON is a mahogany bay, with inside of off hind ankle white and star in forehead; sixteen hands, and weighs 1,100 pounds. Foaled May 10, 1879. He is of fine, kindly disposition, a natural trotter, and has shown great speed, but as yet has no public record. For full history of his sire, Echo, see BREEDER AND SPORTSMAN July 29, 1882. See also, for his full brother, Exile, BREEDER AND SPORTSMAN, issue of September 16, 1882.

TERMS.

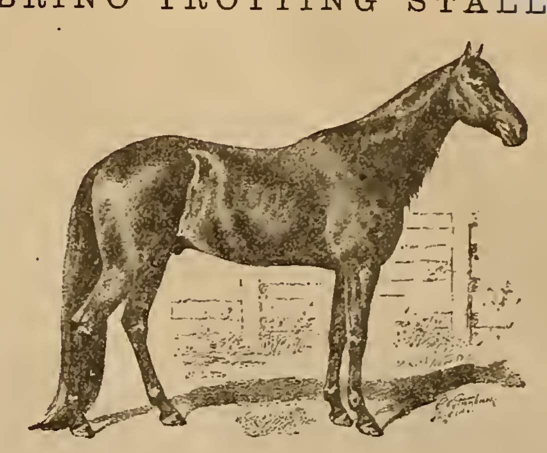
One hundred dollars the season, payable at time of service. All mares at risk of owners. Mares not proving in foal can be returned the following season free of charge. Address

CHARLES J. ELLIS,
Los Angeles.

Post Office Box 55.

MAMBRINO TROTTING STALLION

Record at Six Years Old, 2:21½.



Record at Six Years Old, 2:21½.

ABBOTSFORD.

PEDIGREE.

BY WOODFORD MAMBRINO, HIS DAM COLUMBIA BY YOUNG COLUMBUS. WOODFORD Mambrino by Mambrino Chief, his dam Woodbine by Woodford, a thoroughbred son of Kosciusko.

Woodford Mambrino is recognized to be the best son of Mambrino Chief. His own record is 2:21¾, and there are a large number of his get in the 2:30 list. Among them: Abbottsford, 2:21½; Convoy, 2:22½; Magenta, 2:24½; Lady McFatridge, 2:29; Dacia, 2:29½; George A. Ayer, 2:30.

Besides those having public records, he is the sire of the two celebrated mares owned by Robert Bonner—Manetta and Malice. Manetta, with a running mate, and harnessed to a road wagon, trotted two miles in 4:27½, and Malice trotted a trial, on the same track, a mile in 2:19¾. Woodford Mambrino is also the sire of Princeps, the sire of Trinket; record, 2:14. Woodbine is also the dam of Wedgewood, record, 2:19. Young Columbus, the sire of the dam of Abbottsford, has nine of his get in the 2:30 list, so that on both sides of the house there are notable performers. Abbotsford is a rich rosewood brown, 15¾ hands, and of very high form. His get are very promising, his daughter Jasmine having won the Embryo Stake for yearlings in 1881, and every one which has been put in training has shown good speed.

TERMS.

Seventy-five dollars the season, to be paid before removing the animal. Mares not proving in foal can be returned the following season free of charge. Good pasturage at reasonable rates, and extra pains taken, but no liability for accidents or escapes.

LOCATION.

Abbotsford will make the ensuing season, 1883, on the ranch of S. B. Whipple, Esq., San Mateo, season commencing February 15th and ending June 1st, 1883. For full history see the issue of BREEDER AND SPORTSMAN of August 5th, 1882.

GEORGE BAYLIS, Agent, Sacramento, Cal.

WILL MAKE THE ENSUING SEASON, COMMENCING THE 15TH OF FEBRUARY, 1883, AND ending the 1st of July, 1883, at the Oakland Trotting Park.

TERMS, $200 THE SEASON.

MONEY PAYABLE BEFORE THE MARE IS TAKEN AWAY. GOOD PASTURAGE [illegible] PER month. No responsibility for accidents or escapes.

No. 320 Sansome street, San Francisco, Cal. A. WALDSTEIN

TROUBLE IN TURLOCK.

How Homer Lane was Rung in on an Unsuspecting Tenderfoot and His Backers.

Conntry towns in California have all a sort of family likeness and possess little or no individuality. If the town happens to be what is commonly known as a railroad town, not a terminal point, it is certain to be an exact counterpart of every other railroad town in the State. Turlock on the S. P. R. R. is a railroad towu of the regulation pattern and those of our readers who have never heen to Turlo ck and who care enough about the matter to desire to gain an idea of what kind of a place Turlock is, have ouly to fix their mind npon any other small town on the line of the C. P. R. R. or S. P. R. R. and they will have an exact picture of Turlock. The principal part of Turlock is the huge depot and freight sheds of the railroad company on the northern side of the track. Back of the sheds is situated the Turlock Hotel, a small two-story wooden huilding, which boasts the most comfortable beds and the meanest cnieine of auy hotel in the State. Iu a line with the hotel is the main street of Turlock I saw it four years ago. A post-office and etore at at the corner opposite the hotel, next a small harher's shop, then a saloon, then a dry goode store and fruit store combined. Next a bntcher shop, then a bakery and last but moet importent of all, Charley Bates' saloon. Beyond Bates' is a corral end huilding known as the Farmer's Hotel where the docile lambs who engineer the eixteen-animel teems that haul in and out of Turlock are wont to find food and shelter for themselves and their cattle. Beyond the Farmer's Hotel and all around the town is a hare, sandy, undulating plain that will raise wheat and graze sheep but refuses to do anything more on behalf of mankind, for not a tree is in sight and the people of Turlock have to import their fruit and vegetables from Hopeton Bottom, a well-watered valley ahout twenty-two miles away, which is sneeringly alluded to by the neople of Turlock as the fever and ague district. Beyond the Turlock Hotel is a huge shed known as John Mitchell's barn, in one end of which John Mitchell, the millionaire land owner ot Stanislaus county whose fences stretch twenty miles in either direction, lives worse housed than one of his fine horses. A hlacksmith's shop and a couple of private houses in which live the railroad men, compromise the remainder of Turlock. Not heing a large towu, Turlock is the lest place one would go for auy kind of sport, but Turlock during the season is a red hot town for any kind of amusement from kettling a dog's tail to running a horse race for thousands of dollars. The season in Turlock begins when the thrashing machines start out for the harvest work and ende when the last "eack huck," "straw huck" or engineer has purchased his ticket and started for winter quarters in San Fraucisco. Sunday is the great day for fun in Turlock for on that day all the thrasher crews from the surrounding conntry come into town to buy socks and undershirts and fill their skins up with whisky. Turlock whisky is an institution and a pure type of that brand which people often call 40-rod, sheep herder's delight and other names indicative of concentrated hadness. When a Turlock resident or visitor from sheep camp or thrashiug station fills up with whisky he yearns for amusement; he feels the need of sport to such a degree that he is willing to make a match of any kind from playing poker with lame Dave, the best card sharp in the country, to running a foot race with Charley Bates, who is the boss pedestrian of the town. This characteristic of the Turlock man is pretty well known in the conuty, and naturally enongh has attracted many experts at billiards, cards, racing and other games to Turlock to lay for the granger when he is on his whisky. About four years ago I chanced to he in the town on business at the same time that a well-known wrestler from Grass Valley had elected to make Turlock his abode. This fellow's name was Jenkins—a hig, strapping Cornishman who looked as if he could lift a honse and heave it into a ditch at will. Jenkins soon found a man to wrestle and threw him with ease, shortly afterwards performing similar kindnesses for othere until he had acquired in Turlock the reputation of being the boss wrestler in the country. I happened to go into Bates' saloon one night and when Jenkins was blowing ahout his skill and strength. When he left the place Charley Bates remarked to me that Jenkins was the hest man he had ever seen.

"Oh pashaw!" said I, "Homer Lane or Fox or any good man could throw Jenkina easily. He cannot wrestle at all."

Bates replied with a laugh, and I thonght no more of the matter until abont two weeks later I saw Homer Lane rough and dirty, dressed in a cheap suit of overalls driving a load of wood into the town. I waa about to call to him hy name and ask him his errand in Turlock when he noticed me and gave me a look that said more plainly than auy words could have done, "Keep your mouth shut and mind your own business."

Pretty soon Lane put up his team in the corral of the Farmer's Hotel and strolled into Bates' saloon, where a lot of the boys were drinkiug, and Jenkins among them. I noticed a look of recognition between Lane and Bates as the former entered hut made no remark, and rightly guessing that there was fun afoot sat dowu to enjoy my share of it.

"Take a driuk hoya," said Lane; "wrestling with them durned brutes has made me hot as a kiln, and the road's dustier nor the alkab plains."

"Talking about wrestling," said Jenkins, "reminds me of the day I wrestled Aguew in Nevada City. That was a day hot enough to grill a steak. We tugged at eech other in the hot sun for nigh an hour, when I got au inside lock ou him so and threw him just so." As Jenkius said this he suited the action to the word and landed Lane on the hroad of his hack in the sawdust in the saloon.

This was a favorite trick of Jenkins' and wae one of the many ways he had of asserting his physical superiority over other men. Lane is a small man and Jenkins felt eure that he could do pretty much as he pleased with him.

Lane got up quietly, brushed the dust offhis clothes and remarked: "You are a pretty good wrestler etranger, but I think I can throw you if you will wrestle my style."

"What, a little man like you throw me!" said Jenkins, "how much money have you got? I'll bet you two to one you c n't throw me in a quarter of an hour any style you dam pleasd."

"Well," said Lane, slowly drawing out an old leather pocket hook, "I've got a hundred dollars here that says I can throw you. I was reckoned the heet wrestler in French [illegible] and I don't think any galoot in Turlock can throw

"All right," said Jenkins, as he planked down five twenties to cover Lane's bet, "what style will you have?"

"Collar and elhow," said Lane.

"That's my great holt, stranger," replied Jenkins, "and I'll have to het you a hundred more I throw you twice inside of twenty minutes according to rule."

"I'll see that hundred," said Lane, "and I only wish it was a thousand."

"Want to bet a thousand, do you, well, I'll have to go you," said Jenkins, "here Sam, what stamps have you got? Here's a chance to win a thousand from a duffer from French Camp who thinks he can wrestle."

Lane found the thousand and then the real hot hetting began. Charley Bates allowed that he had got tired of Jenkins and would have to bet a crumh on the stranger. Sam, the gambler, "reckoned he'd toy with Bates' coin for a while," and so the betting went on until pretty near every loose dollar in Turlock was bet on the match, Lane finally putting up his team and load of wood as a het of $750 which the proprietor of the Turlock Hotel seemed very anxious to make.

Charley Bates, as the sporting authority of the town and a man of undoubted honesty, was made stakeholder, and the local blacksmith, who was a hit of a wrestler himself, was picked out for referee. One of the hoys wanted to bet with me near the end of the match making. I told him I never gamhled on a eure thing, and I was dead sure that Jenkins would be thrown. He laughed incredulously and said, "may he you know the stranger?"

"Well, no, I can't say I kuow him," said I, "but I once saw him throw a big hoosier just as easy as you would throw a steer, and I feel sure that Jenkins has met his match at last."

After all the preliminaries were arranged, the hoys went out to select a suitable place in which to wrestle. The sandy ground was voted too soft; Bates' barroom was too small; the freight sheds were full of grain, and at last it was finally agreed to wrestle harefoot on the floor of old Mitchell's big barn. Accordingly every man, woman and child repaired to the place designated. The contestants threw off their shoes, Lane disclosing a pair of regulation two hit cotton socks in the last stage of decay, and then Jenkins threw off his coat and donned a hlue jumper, in one of which serviceable garments Lane was already clad. After some talk and re-arrauge-ment of bets it was finally agreed that all the money was to go on the first two falls.

The men took hold and Jenkins, trusting to his superior size and also judging that he had the most skill, made play at Lane's leg. Lane moved back and Jenkins made play again. Lane simply moved his leg evading Jenkins' strike and going in like a flash got an inside hitch and threw Jenkins on the broad of his hack.

The fall was so clean that there could be no dispute. Jenkins looked mad but contented himself with remarking that he had slipped. The fall made him nervous, however, and when they took hold for the second bout he acted on the defensive contenting himself with trying to wear his opponent out. Seeing that there was no show of Jenkine making play Lane pretended to slip. Jenkins rushed in for a lock when much to his surprise his feet went from under him and down he went like a log. When he picked himself up he began to rage and storm and some of the losers commenced a vigorous kick, swearing that the match was a job and that Jenkins had thrown off on them. For a time it looked as if trouhle would ensue hut the match finally quieted dowu and Lane was allowed to leave town with his winnings which amounted to several thousand dollars.

Charley Bates came to me and asked me not to disclose Lane's identity nor the fact that I had gnessed that Bates had gone to San Francisco, brought Lane up the country, fitted him out with a team and given him the coin to bet, for as Bates remarked "Jenkins had got to he a hlamed nuisance and he was bound to throw him down if he had to send to Europe for a man to do so."

I have never been to Turlock since but I never pass by the town or hear its name mentioned without laughiug at the way in which Jenkins, the pride of Turlock, was floored in old John Mitchell's harn.

Sale of Thoroughbreds.

A London dispatch of the 1st to the New York *Herald* says: "A nnmher of blooded horses, late the property of Mr. F. Gretton, deceased, were sold at auction hy Messrs. Tattersall to-day. Isonomy, hay horse, foaled in 1875, by Sterling out of Isola Bella, hy Stockwell, was bought by Mr. Crawfurd for 9,000 guineas. Isonomy has won at many important meetings. The other highest prices obtaiued were for Acrostic, two years, hy See-saw out of Lady Alice Hawthorn, 1,400 guineas; Geologist, four years, by Sterling out of Siheria, 1,150 guineas, and Prestonpans, five years, by Prince Charlie out of Beatrice, 1,560 guineas. The proceeds of to-day's sale amounted to 19,022 guineas."

Commenting on the foregoing the *Herald* remarks: The price paid for Isonomy is larger than was generally anticipated would he reached, though it falls far short of the £14,000 given for Doncaster or the 12,500 guineas for Blair Athol. The most important races won hy Isonomy were the Cambridgeshire Stakes, in 1878; the Gold Vase, at Ascot, beating Silvio, the Derby winner; the Gold Cup, at Ascot; the Goodwood Cup, the Brighton Cup, the Great Ehor Handicap (carrying 134 lhs.), at York, and the Doncaster Cup, in 1879. The following year he won the Manchester Cup, carrying 138 lhs., and the Gold Cup, at Ascot. The Cambridgeshire of 1878 was the only race Isonomy ran in that year, and he had been out hut three timee in nuimportant two-year-old-races the previone year. He hegan his four-year-old seasou by running second to Parole in the Newmarket Handicap, on which occasiou the American gelding commenced his series of wonderful victories. One of Isouomy's most meritorious losiug performauces was his getting fourth place in the Cesarewitch of 1879, when he had to carry 136 lhs., Chippendale winning on that occasion with 33 lbs. less weight in the saddle. It is very generally conceded, however, that Isonomy's victory in the Manchester Handicap was ahout the hest thing he ever did, and this horse's succcss was due in no small measure to the marvelons riding of Tom Cannon. When Isonomy was retired from the turf he left it with the reputation of heing "the horse of the century." The two-year-old Acrostic is grandly bred, hut in his two trials this year he only managed to get third place on each occasion. The first time was in the Clearwell Stakes, when he was behiud Hauteur and Goldfield, and in the Dewhurst Plate Ladislas and Goldfield finished in front of him. In the latter race the distance between second and third was only a neck, whereae when they finished iu the Clearwell Stakes there was a difference of two lengths. Geologist and Prestonpans are both well-kuown racehorsee. The list of horsee to be eold on thia occasion numbered thirty-four, and if they were all disposed of those not mentioned realized a very small average. On Monday next the mares and foale formiug the remainder of the stud will he disposed of hy Messrs. Tattereall.

Alfalfa on Tule.

Included in the 400 and more acres of land belonging to the Asylum is quite an amount of tule land hordering on Napa river. It has long been the aim of Dr. Wilkins, resident physician, to euhdue this tract and hring it into a high state of cultivation. To accomplish this, ditches have been dug, dykes thrown up and several acres were plowed for the first time this fall. It will he one or two years hefore this latter tract is thoroughly snbdued. As an experiment Dr. Wilkins, soon after the first rains of this season, sowed upon eome of the unplowed tule land alfalfa seed which was not harrowed in. The tules were first mowed dowu and the stubble, if we may so term the hutts of the stalks, afforded protection to the tender alfalfa plants, for the seed sown sprouted at once. Now the new grass is growing rapidly and evidently will soon cover the ground. This successful experiment es worthy the attention of all who own overflowed lands, for if without the tedious process of plowing and harrowing for two yeare this land can he transformed into fields of the rapidly-growing alfalfa, mnch time, labor and expense will be saved.—*Napa Register*.

This experiment is by no means a new one. Time and time again it has been tried and to our knowledge it has proved a failure. Alfalfa is not a marsh grass nor will it he a success when planted in a soil where water lies near the surface, for these reasons: Almost as soon as the germ hreaks the ehell of the seed a long slender tap root is sent down which increases in length and size with the growth and age of the plant on the surface. The writer has seen these tap roots that have measured eighteen and twenty feet where the washing away or caving of a creek bank has left the roots exposed to view. When alfalfa is plented in marshy ground where the water lies only a few feet from the surface the hark on the tap root becomes rotteu and will soon slough off. A plant with its main root and chief snpport in this unhealthy condition will not thrive nor last as a profitable grass more than two years, but when pleuted in proper soil we have known of its producing profitable crops after fourteen years harvesting of two crops of hay a year beside using the stubble for pasturiug after each crop. When the tap root finds plenty of water at two to five feet and the hark sloughs off the plant loses its healthful appearance and depends on the few surface roots to support what little life it retains. After getting the views of men who have made the raising of this grass a study for years, beside some personal experience, we have come to the conclusion that alfala requires a moderately dry, loose sandy or loam soil with weter from ten to twenty-five feet down. Alfalfa is often profitably raised far up on hillsides, in places where at first sight it would seem like throwing away seed in plantiug. Alfalfa is fast becoming one of the favorite hay grasses and its raising reqnires more study than any other in order to be a success.

Study the Face.—A story is told of a great French satirist, which finely illnstrates his knowledge of human nature. He was traveling in Germany, in entire ignorance of its language and currency. Having obtained some small change for some of his French coins he used to pay drivers and others in the following manner: Taking a handful of the nnmismatical specimens from his pocket, he counted them one by one into the creditor's hands, keeping his eye fixed all the time on the receiver's face. As soon as he perceived the least twinkle of a smile he took back the last coin deposited in the hand and returned it, with the remainder, to his pocket. He afterward fonnd that in pursuing this method he had not overpaid for anything.

Some etrange things have occnrred in connection with thoroughbred mares and their foals. The Druid tells of a mare nemed Eldon, having lost her own foal, drove Madcap, her paddock companion, away from her hanthing, adopting it as her own. Another mare named Milksop took fright at her foal and flatly refused to snckle it. Sir Charles Bunhury had a gray colt by Diomed (winner of the first Derby), with five legs, one growing out of his chest, and sold it to a showman. Vesta had fourteen foals, all grays, end Speed made a point of killing all her foals, while Turf never reared one. A horse, well-named "Resurrection," was supposed to have heen horn dead and was thrown on to a dnng heap, the warmth of which revived him. On the Petworth estate in 1825, nearly every brood mare and she ass cast well grown dead foals for no cause that could he made out. A mare by Orville went thirty-seven days beyond her time, and gave birth to a foal with no feet, and her half-sister shortly after had one without eyes. The dam of Montreal, owned hy Lord George Bentinck, bred only three seasons and had twins each time. There were a pair of twins named "Tweedledum" and "Tweedle-dee," one of which throve better on cow's milk than the one left with its dam.

The London *Sporting Life* of December 16 notes the arrival of Charles Rowell, George W. Lee and Mr. P. Duryea in England on the previons day. Mr. Duryea, Rowell and Lee left Liverpool for Cambridge Station, where they received a good old fashioned English welcome, and at once drove on to Chesterton (Rowell's home and birthplace), where they intend making a long stay. Alfred Langford (who attended upon Rowell in his last race in New York), was one of the party, but came on to London. Both Rowell and Lee are looking wonderfully well. Lee did not bring any boats with him, and has, in reality, made the trip more for pleasure and to recruit his health than with a view to engage in any sculling races on the Thames or Tyne. However, Mr. Duryea would have no objection to match Lee to row Goodwin, Buhear or Lew Gibson for £100 a side, the race to come off in eight weeks from signing articles.

The *Sportsman* devotes the first of its winter articles on horses in training to the stable of Matthew Dawsou, and notes that he has no less than seventy-one head, of which forty-four are to-day two-year-olds. "If the breeding goes for anything," says the *Sportsman*, "the stable will send out some two-year-old winners in 1883, as they represent some of the best blood in the kingdom." John Dawson, brother of Matthew, has twenty-seven in charge, while Charles Archer, brother of Fred, has no less than thirty-seven, including the two American-hreds Abbottsford and Wallenstein, both six-year-olds by Waverly and the property of Lord Ellesmere.

It seems to us that we have heard of less accidents from gunning this season than usual. This is a gratifying thing to note though we are at a loss to account for it unless accounted for as many other things are—the comet year.

IMPROVED HORSE CLOTHING.

Secured by Letters Patent ISSUED MAY 27, 1879. REISSUED MAR. 29, 1881.

The above cut represents the body-piece, the patent also covering the improvements in the hood. The following are the claims granted:

1. An improved blanket or covering, consisting of the body-piece A, flap C, and the extension B, formed or united together, so as to cover the body and lege of the animal, substantially as herein described.

2. The blanket or covering A, having the flap C, and the extensions B, to fit the fore and hind legs of the animal, front fastenings F G, and the permanent straps or bands E, substantially as and for the purpoee herein described.

3. The blanket or covering A, with its extensions B, permanent securing-bands E, and the front fastenings F G, in combination with the elastic neck-extension H, substantially as and for the purpose herein described.

4. The blanket A and hood J, in combination with the elastic connecting-strip I, substantially as described, and for the purpose set forth.

5. The close-fitting hood J, having the elastic band L beneath the jaws, so that they may be allowed to move without disturbing the fit, and adapted to be secured to the cover by means of straps, substantially as herein described.

6. The improvement in covering-blankets for animals, consisting of the blanket A, having the flap C, and permanent straps or bands fixed to it to secure it around the body, whereby the use of loose surcingles is evoided, substantially as herein described.

The right to make clothing in the United States will be sold on a royalty. Apply to the patentee,

JOS. CAIRN SIMPSON,

SAN FRANCISCO, CAL.

☞ S. P. Atlantic Express Train via Los Angeles, Yuma, etc., leaves San Francisco daily via Oakland ferry, foot of Market street, at 9:30 A. M.

TO

Sportsmen & Pleasure-Seekers.

THE

SOUTHERN PACIFIC R. R. CO.

RESPECTFULLY CALLS ATTENTION TO THE

SUPERIOR FACILITIES

AFFORDED BY THEIR LINE FOR REACHING with speed and comfort the best places in the State for

Sea Bathing, Shooting and Fishing.

TRAINS LEAVE SAN FRANCISCO DAILY FOR

MONTEREY,

THE MOST CHARMING

Summer and Winter Resort of the Pacific Coast,

with its beautiful Groves and delightful Drives. Front in abundance can be obtained from the several streams in the vicinity of Monterey, and the best shooting may be had in season.

THE BAY OF MONTEREY

Is noted for the extent and variety of fish which abound in its waters, notably Salmon, Rock Cod, Barracuda, Pompino, Spanish Mackerel, and Flounder. The above-mentioned attractions, in connection with the low rates of fare, rapid transit, and the superior accommodations furnished at the "HOTEL DEL MONTE," have made Monterey a paradise for sportsmen.

THE BATHING ESTABLISHMENT

OF THE

"HOTEL DEL MONTE,"

IS UNSURPASSED.

A SPACIOUS SWIMMING TANK

(150 x 50 feet)

FOR WARM SALT WATER, PLUNGE AND SWIMMING BATHS.

ELEGANT ROOMS

For Individuel Baths with DOUCHE and SHOWER facilities.

MAGNIFICENT BEACH

Of pure white sand for SURF BATHING, Etc., Etc.

THE FAVORITE ROUTE to those well-known Watering Places,

APTOS, SOQUEL AND SANTA CRUZ,

IS VIA THE

Southern Pacific Railroad,

(Broad Gauge), and the

SANTA CRUZ RAILROAD.

☞ At PAJARO, the SANTA CRUZ R. R. connects daily with Trains of the S. P. R. R.

The S. P. R. R. runs through the counties of San Mateo, Santa Clara, San Benito, Santa Cruz and Monterey, in each of which game abounds in great variety. Notably

Quail, Pigeon, Snipe, Duck, Geese, Deer and Bear.

Lakes PILARCITOS and SAN ANDREAS are reached by this line. Stages connect with trains daily at San Mateo for those well-known Retreats, PURISSIMA, SAN GREGORIO and PESCADERO. We would particularly call attention to the unlimited extent of range at and about SAN BRUNO and McMAHON'S for RIFLE PRACTICE.

These resorts are but a short distance from San Francisco and offer special inducements to the lovers of this manly sport.

SPECIAL NOTICE.

Sportsmen and others presenting Passage Tickets o any description issued by this Company will be entitled to

FREE TRANSPORTATION OF THEIR DOGS

when carried in Baggage Cars and put in charge of Train Baggagemen. Train Baggagemen are instructed to issue CHECKS for all dogs received in Baggage Cars.

☞ In order to guard against accidents to Dogs while in transit, it is necessary that they be provided with COLLAR AND CHAIN. Guns and Fishing Tackle checked and carried free of charge. Guns taken apart and securely packed in wood or leather cases may be taken in Passenger Cars.

TICKET OFFICES.—Passenger Depot, Townsend street, and No. 2 New Montgomery street, Palace Hotel.

A. C. BASSETT, Superintendent. H. R. JUDAH, Asst. Pass. and Tkt Agt.

☞ S. P. Atlantic Express Train via Los Angeles, Yuma, etc., leaves San Francisco daily via Oakland Ferry, foot of Market Street, at 9:30 A. M.

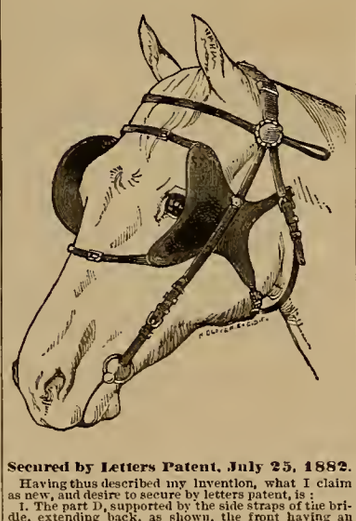
IMPROVED
Blind Bridle & Winkers
FOR RACE HORSES.



Secured by Letters Patent, July 25, 1882.
Having thus described my invention, what I claim as new, and desire to secure by letters patent, is:
1. The part D, supported by the side straps of the bridle, extending back, as shown, the front having an opening into which the blind is fitted, substantially as herein described.
2. In a bridle, in combination with the extensions D, the curved blinds F, secured to said extensions, and as shaped, to give full freedom and ventilation to the eye while circumscribing the vision, substantially as herein described.
3. In a bridle, and in combination with the extensions D, blinds F, and side straps A, the screw, nut and washer E, to secure the blind and allow it to be set, substantially as herein described.
4. In a bridle, and in combination with the checkpieces D and blinds F, as shown, the straps or bands G and H, connecting the branches or extensions above and below the eyes, and having the adjusting slides or buckles, substantially as and for the purpoas herein described.
5. In a bridle, and in combination with the blinds F, supported and pivoted to the bridle ao as to be movable about the point of support, the adjustable front straps or bands G and H, and the rear band I and the throat-latch or lash connected with the blinds, and adjustable, substantially as herein described.
The above are the claims allowed by the patent office, and though the corresponding letters do not appear on the cut, the general principle will be understood.
It meets with universal approbation, doing away with all the objections urged against blinds, and at the same time giving complete control of the line of vision. By throwing the lower portion of the blind up something of the same effect on the action follows as is induced by toe-weights. This is especially the case when young colts are the pupils, teaching them to bend the knee without tha strain of weighta on tha feet.
For bridles of all descriptions apply to

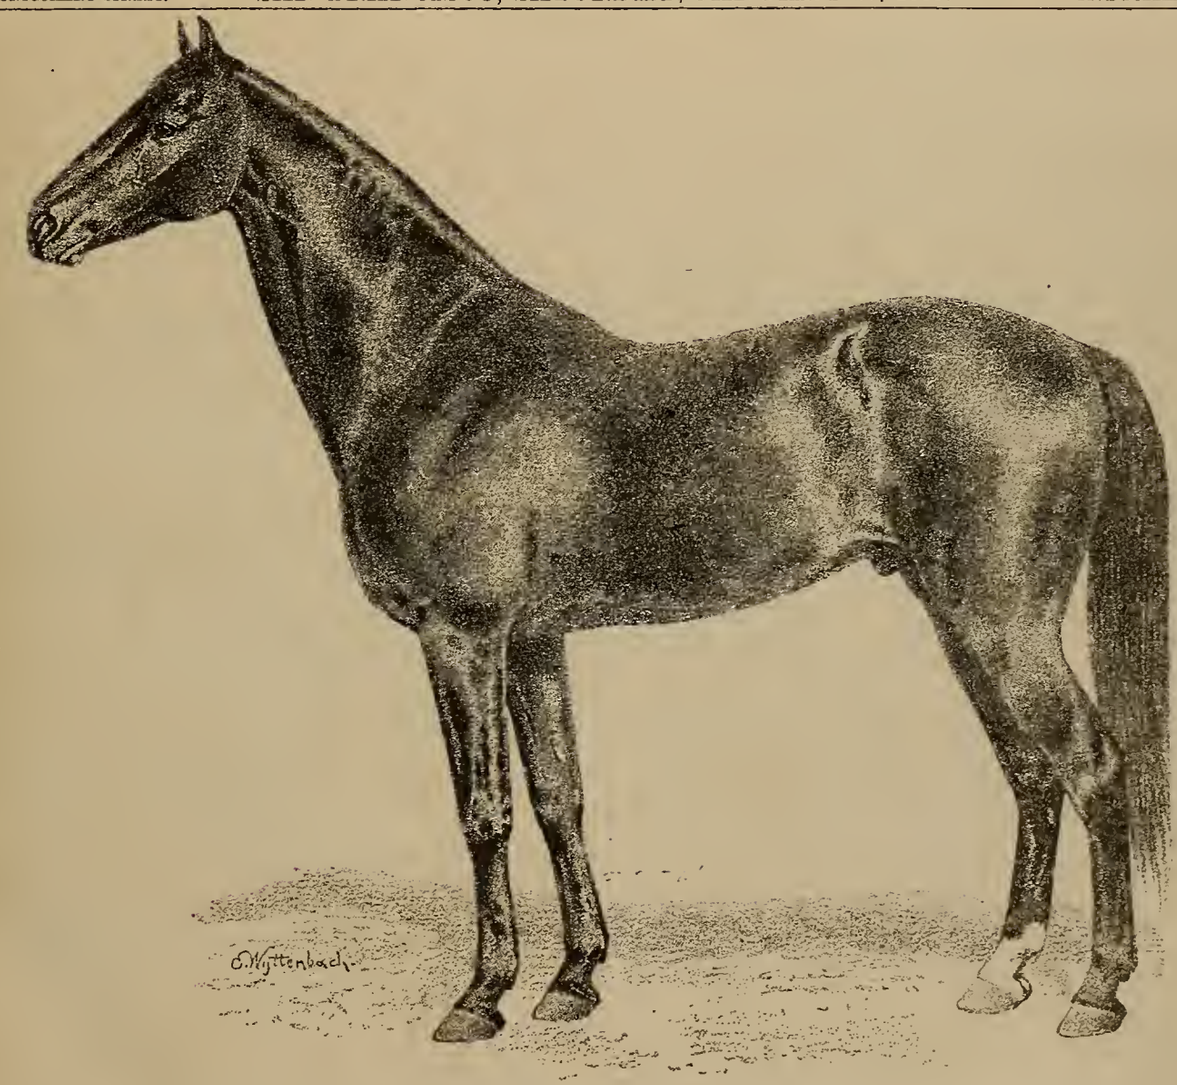
SAN FRANCISCO, SATURDAY, JANUARY 27, 1883.

SUBSCRIPTION
FIVE DOLLARS A YEAR.



THE GRAND MOOR—By the Moor, his dam Kate Taber, by Mambrino Patchen. Owned by NEWLAND & PUMYEA, OAKLAND, CALIFORNIA.

The Moors have earned high fame on the trotting tracks of California. Earned is the proper title, as real work has been done to accomplish what they have performed. This, too, has been accomplished in shorter time than families nsually acquire distinction, and in sixteen years from the date when the founder was foaled there have been two generations of celebritiee. This is properly regarded as being the best test of "potency," and the faculty of transmitting the desired qualities, as a family characteristic, is what the breeder most anxiously desires.

It is apparent that there must be more definite guides than the original family name, although the remote aucestry of right figures in the calculation, and it is no small thing to belong to the tribe from which The Moor sprang. The Clays have held a high place in trotting annals, and from the time when Henry Clay first gave the distinctive appellation until the present day the blood has been highly prized. But this celebrity has so increased the numbers of the sept that the title has become somewhat indefinite, in order to give a clearer conception of the blood. Thus, in California are two well-known branches of the Clay family, viz., the Patchens, and that which is now the subject of this article. Both trace on the paternal side to Cassiue M. Clay. The line of descent from this horse, acknowledged to be one of the greatest trotting stallions of his day, is through his son, Neave'e Cassius M. Clay. This horse was the sire of Clay Pilot, the sire of The Moor. Cassins M. Clay was by Henry Clay, and his dam was Jersey Kate, an excellent road mare, and said to be by Mambrino, the sire of Abdallah. She was also the dam of John Anderson, who was one of the notables of his time. The dam of Neave's Cassins M. Clay was by Chancellor, a son of Mambrino, and his grandam by Engineer 2d, the sire of Lady Suffolk. This horse was the sire of Sayre's Harry Clay, the sire of the dam of St. Julien, Electioneer and several other celebrated broodmares. Had he never done more than to give Green Mountain Maid and Flora to the trotting stud, it would have been a rich inheritance, and ono that would perpetuate hie fame as long as the fast trotter ie appreciated. As the name indicates, Clay Pilot, the sire of The Moor, brought in the Pilot Jr. strain that figures eo prominently in the genealogy of Maud S, Nntwood, Noontide, Jay-Eye-See, and others of the present celebrities of the tracks. There is not a reasonable doubt that tbe dam of The Moor, Belle of Wahash, was a very highly hred mare, and the pedigree, as given at the time when she was trotting, is correct. At the time of the Embryo trot we questioned John Williams in relation to the matter, and he says that the correctness of it is beyond dispute. Mr. Williams not only trained and drove Belle of Wahash, hnt also lived with Mr. Weiseger, the breeder of Belle, and is familiar with the stock he owned.

The pedigree is as follows: The Moor, black horse, foaled 1867, bred by Geo. C. Stevens, Milwaukee, Wis., by Clay

(CONCLUDED ON PAGE 57.)

THE MORGAN CONTROVERSY.

Further Evidence that True Briton was the Original Morgan's Sire.

EDITOR BREEDER AND SPORTSMAN: Since my last article was written I have received two letters from Mr. F. A. Wier of Walpole, N. H. The first is dated Jan. 2, 1883, and is as follows:

"I commenced looking up in regard to the Justin Morgan horse as early as 1831. I must have seen and conversed with one hundred and fifty or more that had bred from the old horse and others that had owned his stock. Could trace him to Goss, then to Morgan when a colt at Randolph. Could get no dates when he was taken to Randolph. The first I got was in the *Cultivator* in 1842, by Justin Morgan Jr. I never heard him called a Dutch horse until then. I saw Judge Griswold; showed him the *Cultivator;* he said it was earlier. He said the "Dutch" was a pet name because stout in legs and thick and strong in body. He said he attended the race with Sweepstakes. Morgan dotes on his English blood. Griswold knew more about Morgan matters than any other man I found. I often saw him.

"Solomon Steele had no dates in 1841. I know where he got his. I went past his house three or four times every winter on my way to Canada; often saw him. There were no dates to be found before 1842, and he made a mistake. I know his reason for not correcting it. F. A. WIER."

I sent Mr. Wier the advertisement of the Figure horse for the season of 1793 and the following is his reply:

"I learnt from Justin Morgan Jr., Judge Griswold and others that Morgan had no other stallion. He advertised his horse and had a stallion name for him; they did not remember it, but knew he had one. Stood him at Randolph, Royalton and other places. After the family was broken up was away a good part of the time at Royalton and Woodstock; always kept the horse with him; died at Woodstock; a short time before he made the horse over to Rice to pay his bills. Rice sold him to Robert Evens. The running and log-hauling he did for Evens was done after Morgan's death; he never had him before. I think Evens had the three-year-old gelding; let Morgan have a cow in some way. You say the Figure horse went north. Was not that the time Goss took him to St. Johnsbury? The advertisement you sent me makes it quite clear to my mind that he was the old horse. * * * Morgan inquiries are very plenty now-a-days. Yours, etc., F. A. WIER.

"January 11, 1883."

For nearly forty years has the pedigree of the horse Justin Morgan, as given by John Morgan, been considered true. Now it is claimed by some to be untrue, and the only evidence they have given to disprove it is:

First, that John Morgan was not living at Springfield, Mass., the year (1795) that it was understood that Justin Morgan took the horse or colt to Vermont, that he removed to Lima, N. Y., in February, 1791, and so could not have known anything in regard to the colt that Justin Morgan got in Springfield in 1795.

Second, the advertisements for True Briton are found, and they show that he was kept by Justin Morgan at West Springfield, Mass., the season of 1785, and at Springfield, Mass., by John Morgan, the seasons of 1788 and 1789. It is claimed that as True Briton was at Springfield the seasons of 1788 and 1789 he was not there the season of 1792, the season that it has been understood that the horse Justin Morgan was sired.

This is the evidence that has been given to disprove the pedigree. They admit that John Morgan knew of Justin Morgan taking a True Briton colt to Vermont, but they claim that it was in 1788, the year that Justin Morgan removed to Vermont, that he took the True Briton colt. They claim this without giving a particle of evidence to show that it was so. It is needless to disprove what is not proved, and so I shall say nothing in regard to this claim except that Justin Morgan's grand list at Randolph for the year 1789 (and the first one he had at Randolph) shows that he owned no two-year-old colt or horse that year. The advertisements of True Briton, instead of disproving the pedigree, help sustain it, for they prove what John Morgan said was true, that Justin Morgan kept True Briton one season and that John did two seasons, and they show that there was a mistake made in the year that the original Morgan horse was taken to Vermont—that it was earlier than 1795. Everyone that has had any experience in looking up dates will admit how hard it is to get reliable dates at times; certainly when one has to trust to the memory of others, often no two will agree in the time. You write to one to give the date in regard to a certain transaction that you know he was knowing to; he will often give you a date that you know is wrong; you see him, talk it over, put this and that together, and you will then be apt to get the correct time. Justin Morgan on the spur of the moment wrote in 1842, some fifty years after the event had happened, that his father took the horse to Randolph in 1795. His son, H. D. Morgan, now of Stockbridge, says he always understood his father that his grandfather was keeping horse when he took the horse to Randolph and that he broke up keeping horse in 1793. Judge Griswold is quoted as saying that it was in 1795 that Mr. Morgan took the colt to Randolph, but it turns out that his statements come through Mr. Wier. Mr. Wier states that in a letter that was published in the Albany *Cultivator*, June number for 1846. Now Mr. Wier says in a letter dated March 4, 1879, that he called on Justin Morgan at Stockbridge and asked him to fix the time that his father took the horse to Randolph. Mr. Morgan said he could not for a certainty, as he had no dates to refer to; after a while Mr. Morgan gave it as his opinion that it was in 1795. Mr. Wier says, too, that he talked with Judge Taxbox and Judge Griswold in regard to the time the horse was taken to Randolph and they thought it was earlier than 1795, but thought Mr. Morgan's son would know better than they. Mr. Wier gives it as his opinion now that the horse was taken to Randolph as early 1792.

It is admitted that when Mr. Morgan got the colt at Springfield he went there after money that was due him, that he had quite a family to support and that his circumstances were limited. This is shown by his estate paying but eighteen cents on the dollar. If it was 1795 he had waited over seven years for his pay. Do people whose means are limited do so? Everyone knows they do not, and it is very unreasonable to claim that Mr. Morgan did. He was all sold out and his family broken up in 1793. He would have wanted what was his due when he was keeping house and doing business at Randolph, and would have gone for it then. He would not have waited until two years later before going for it.

Mr. Wier in the letter to the *Cultivator* that has been quoted states that John Morgan wrote him that he, John Morgan, kept True Briton the season that he sired the original Morgan horse. Justin Morgan in his second letter to the *Cultivator* gives the same statement. Mr. Wier writes, April 16, 1879, that one of the many questions that he asked John Morgan was who kept True Briton the season that the Morgan horse was sired. Mr. Morgan replied in a letter dated Jan. 31, 1845: "I kept the True Briton or Beautiful Bay at the time the original Morgan horse was sired."

In describing the Morgan horse John Morgan wrote Mr. Wier that he was a bright bay with a very dark mane and tail.

The statement of John Morgan that he kept True Briton the year the Morgan horse was sired shows that he was sired either in 1788 or 1789, as it was those seasons that John Morgan kept True Briton, and that he was foaled in 1789 or 1790 and taken to Vermont either in 1791 or 1792. It shows beyond all doubt that the True Briton colt that John Morgan knew Justin Morgan to take to Vermont was not taken there in 1788, when he moved there, nor in 1795. It must be remembered that John Morgan said the Morgan horse was a bright bay, and in his letter that was published in the July number of the *Cultivator* for 1842 says: "I have always understood that Morgan kept the colt at Randolph, and that he was very celebrated for his stock." Now, what bay horse but the Justin Morgan did Mr. Morgan have at Randolph that was celebrated for his stock? Solomon Steele, in a letter dated March 12, 1856, says: "Justin Morgan brought him to Randolph, Vt., from Massachusetts in the autumn of 1795. Mr. Morgan intended to apply him to the payment of a note held against him." Mr. Steele knew that Mr. Morgan's son called the year 1795 and this is why he said so. It is nothing strange that they made a mistake in the time that the Justin Morgan was taken to Vermont; mistakes of this kind are quite frequent. It was stated at first that Abdallah was foaled in 1825 and died in 1852. It is now stated that he was foaled in 1823 and died in 1854. The year that some of the noted horses were foaled is given wrong in the "Trotting Register," and, too, the pedigrees of some of the noted horses. It was claimed at first that John Morgan could not have known anything that took place at Springfield after he removed to Lima, he being then some four hundred miles from Springfield. But it was soon learned that John Morgan, when he removed to Lima, left at Springfield his oldest son, of some five years; that he lived at Springfield at his grandfather's house during his minority; that he visited his father at Lima before he was of age; that he removed to Vermont in 1829, and lived there until 1860; that he visited his father at Lima while living in Vermont, and that his father visited Springfield before his son removed to Vermont.

The fact of Mr. Morgan's son being left at Springfield shows what a desire Mr. Morgan and his family would have had to hear from Springfield, and that they would have heard quite often. It is a fact that people living one hundred or a thousand miles away from a place may know more in regard to some things that have taken place there than some that were living there at the time. News goes strangely and it travels fast. No one can tell, when he has told a thing, when or where it will stop. The American people are remarkable for wanting to hear and know what is going on, and this is why editors take the pains they do to give all the news that they can. It is a fact that people will try and know in regard to what is interesting to them. Now, what would be more interesting for John Morgan to know than that his relative and neighbor, Justin Morgan, had taken to Vermont a True Briton colt to keep for a stock horse? Would not John Morgan have been interested to know in regard to the stock of the horse he had kept? Most certainly he would. But it is claimed that when John Morgan and his son met the word horse was never mentioned or thought of. There is about as much to this claim as there would be to a claim that the word marriage is never mentioned or thought of by young people. John Morgan states: "I have always understood Morgan kept the colt for a stud at Randolph, and that he was very celebrated for his stock." This statement shows that John Morgan had taken the trouble to learn in regard to the True Briton colt that Justin Morgan took to Vermont, and the word "always" shows that he had heard in regard to him more than once. Now, how did he hear unless it was in part through his son?

John Morgan Jr. lived at Windsor, Vt.; Justin Morgan Jr. lived at Stockbridge. The two towns are but thirty miles apart, and it is reasonable to say that the two men met, and that John Morgan Jr. learnt of Justin Morgan Jr. all he knew in regard to his father's horse. Justin Morgan Jr. was quite a politician. He served as Senator in the Vermont Legislature, and there cannot be any doubt but that he was at the great campaign meeting of the Whigs, at Windsor, in 1840, the largest political meeting ever held in the State.

One fact in regard to the Morgan horses is not understood by some. Because they were first bred in Vermont and for a while the popular blood, it is supposed it was so throughout the State. This was not so. A breed of horses may be celebrated in one part of a State, and not much known about them in another part of the same State. The Morgans were first bred in Vermont, on the east side of the Green mountains, and it was here that they were the popular blood.

We will quote the graphic words of L. B. Arnold to show the effect the mountains have had in regard to the people of the two sections of the State: "The backbone of the Green mountains runs through the State near its middle, and so effectually cuts off communication between the east and west sides that the people living in either division mingle and know as little of each other as if they belonged to different States. The mountains reach down to the level of the rest of the world, not by gradual slopes, but by a succession of mountain-like hills of various heights, that are scattered, or rather thrown, along the slopes of the mountain ranges in wild confusion, some high and some low, some rough and some gently rounded. The little streams and the highways make very tortuous courses as they wind their ever-curving ways between and around these multitudinous elevations, reminding one of the serpent's track. 'It wires in and wires out,' etc. In the intervals between these hills are often found stretches of rich and comparatively level land, but on the more elevated portions the soil is light and dry, and the grass not at all remarkable for its luxuriance, but it has the quality of being sweet and nutritious."

The Hambletonian horses were bred in Vermont on the west side of the mountains. It was in 1844 that Black Hawk was taken to Bridport, Vt. The first state fair was held at Middlebury in 1851, the second at Rutland in 1852 and the third at Montpelier in 1853. The fairs brought the horses of the two sections together. But there have been but few Hambletonian and Black Hawk horses kept on the east side of the mountains in Vermont and, too, but few Morgan horses (from the Woodbury and Bulrush branch of the Morgans) kept on the west side of the mountains.

It was claimed at first that True Briton was not stolen from Col. James De Lancey. Now it is claimed that True Briton was not much of a horse. This is a little amusing. It sounds like: "They never borrowed the kettle, and the kettle was cracked when they borrowed it."

It is a fact that great persons and great horses are not always appreciated through their life-time. They often die through want and neglect and after their death their great worth and merits are discovered. Abdallah, the sire of the most prepotent sire of trotters that we have had died, through neglect and starvation.

Andrew Carsa lived near King's Bridge at the time True Briton was stolen. He knew Col. DeLancey well, and his horse True Briton, and he told Sanford Howard that the horse was a blood bay of fine size and strength, and that he had repeatedly seen Col. DeLancey jump him back and forth over a fine-railed fence for the amusement of bystanders.

Mr. Howard in a lecture on the horse delivered at Boston in the Statehouse said that Mr. Carsa informed him that after the fighting was over and before peace was declared Smith called on Col. DeLancey, supposing as the war was over that bygones were to be bygones. DeLancey appeared to receive him hospitably, invited him to breakfast, and while at the table DeLancey and his slaves rigged a temporary gallows in the barn and dragged Smith to it and hung him. This act so aroused the indignation of the people that DeLancey soon left for England. Mr. Howard further said that gentlemen of the highest respectability now living at Fordham corroborate the statement of Mr. Carsa, as agreeing with what they have repeatedly heard from people who resided here previously to and after the Revolution. One authority states that it was Col. DeLancey's father, James DeLancey who was at one time Chief Justice and also Lieutenant Gavener of New York, that imported the horses Wildair, Lath, Cub Mare and a daughter of Sampson.

Lassing's "History of the Revolution" states that Oliver DeLancey was brother to the Chief Justice (also Lieutenant Governor) DeLancey, that he was one of the earliest, most influential and efficient of the Loyalists, that he with his son Oliver and nephew James performed active service in Lower West Chester. He was commissioned a Brigadier and authorized to raise three battalions of Loyalists; this he did. His son Oliver was commissioned a Captain of horse in 1776. At the close of the war Gen. DeLancey went to England, was elected a member of Parliament and died there, in 1783. His son accompanied him and rose to the rank of Major General. At the time of his death he was almost at the head of the British army list. James, nephew of Gen. DeLancey, commanded a battalion of horse in his uncle's brigade. On account of his activity in supplying the British army with cattle from the farms of West Chester, his troop were called Cowboys. Capt. Cushin surprised Col. DeLancey's corps near No. 8 and captured over forty of them; the Colonel was absent at the time. The confiscation act of the New York Legislature swept away the largest portion of the DeLanceys' estate.

In an article in the New York *Sun* entitled "Early New York Racing History," in speaking of the Delanceys it says: "For half a century, till the breaking out of the Revolution, they had full swing in the city of New York. James DeLancey's friends did not deny that he liked cock fighting, horse racing and women, but he wants hypocrisy to conceal his faults; they were a handsome race also, and powerful, stalwart men. As a family they were noted as the head of the racing society of the continent and it is doubtful whether there is any stable in the country to-day that can be compared in extent and variety with that of James DeLancey at the height of his fame.

"The New York gentlemen were not loath to meet the sportsmen of Maryland and Virginia on their own ground and brought home many a rich prize.

"In October, 1769, James DeLancey's famous bay horse Lath won the £100 purse, at Philadelphia. In May, 1773, Capt. DeLancey's bay mare Sultana won at the same place the Whim purse of £50.

"In 1774 the Jockey Club plate of £100 was won by James DeLancey's Slamerkin."

In speaking of the great race-horse True Briton it states his owner. Waters, had for two years challenged the continent to a trial of speed, and after giving the particulars of his race with Selim, it says there was another True Briton. He was the favorite horse of James DeLancey, who took part with the Crown in the Parliamentary struggle, and was Colonel of a royal regiment, and chief of the famous Cowboys who ravaged Westchester. Devotedly attached to his mother who resided on the old homestead at West Farms, he was wont to visit her whenever an opportunity offered. On one occasion he tied his horse to the gate and, depending on the watchfulness of his orderlies, was paying his customary visit when some Skinners, as the patriot farmers were called, took advantage of the carelessness of the guard and stole the horse. DeLancey heard the hoofs and raising the neighborhood made hot and long pursuit, but there was no catching the gallant beast. He was taken across the lines into Connecticut, and is said to have been the sire of the famous Morgan stock. Andrew Carsa, the last of the guides of the American army, relates that he had seen Col. DeLancey jump True Briton back and forth over a five-railed fence.

It states that James DeLancey sold out what remained of his stud in the fall of 1775.

From the evidence that has been given, the friends of the Morgans have all faith that True Briton was the sire of the Justin Morgan, and, too, that True Briton was Col. James DeLancy's favorite saddle horse. The fact that Col. DeLancey's father owned some of the very best horses in America is proof that his son's favorite saddle horse was a well-bred horse. It has been shown that the sportsmen of the two sections met in contests of speed, and DeLancey may have bred some of his mares to some of the Southern horses, and they may have done the same to DeLancey's horses, and True Briton may have been by Traveller out of DeLancey's imported racer, as his advertisement states.

Wildair was thought so much of that he was taken back to England, and there served at 40 guineas a mare.

Cub Mare is said to have been one of the most valuable mares ever imported, and that nearly all the best horses of America trace to her either on the dam's or sire's side.

It is stated if True Briton was DeLancey,s saddle horse, he was nineteen years old or more when he was advertised "in his prime." It is a fact that aged horses are called younger than they are, as it is believed they are not as sure foal-getters as young horses. The advertisement of certain a celebrated horse said nothing about his age (he was 25 years old) but it said: "He is keen as briar." We give as a curiosity the advertisement of a horse that stood in New Hampshire during the season of 1816:

THE NOTED HORSE OLD HERO, NOW 40 YEARS OLD, POSSESSES all the beauty and vigor of youth. Was sired by Old Driver, imported by Gov. Wentworth. His stock is unanimously considered superior to that of the famous horse Bulrock. Terms, $6 to warrant.

The following is the advertisement for the celebrated horse Bulrock:

THE CELEBRATED HORSE BULROCK IS TOO WELL KNOWN. His excellence as the first horse in New England has been acknowl-

edged by gentlemen in the different States. Is the same horse that was owned by Mr. B. Thompson, of Andover. Terms, $10 the season. New Boston, N. H., April 30, 1816. JOHN WILSON.

The celebrated horse Bulrock may have been the young Bulrock that was advertised at Springfield in 1792. The advertisement is given as a crumb for those that believe that young Bulrock was the sire of the Justin Morgan.

Now, one word in praise of the little horse Justin Morgan. I say little, as I believe he was not more than thirteen and a half hands high, and that he did not weigh more than 850 pounds. Linsley in his "Morgan Mares" states that he was about fourteen hands high and weighed about 950 pounds. This work was written when the Morgans were at the height of their popularity, and by a partisan. So it is not as reliable as it should be; the weights of the horses given are often too large by 100 pounds. It states that Sherman was thirteen and three-quarters hands high, and weighed 925 pounds. Sherman's last owner says he weighed 850 pounds.

In considering the qualities of the little horse Justin Morgan, one is astonished to find what a great horse he was. Taken to the mountainous and new State of Vermont, the year we say she was admitted into the Union, he endured hardships and privations through his life that would have used up and killed many a horse, yet he lived to the great age of 30 years, and then his death was caused by a kick from another horse.

This shows what a constitution he had, and, too, what good feet and limbs, as he was sound at the time of his death. Had he had the care that he should have had, and that he was deserving of, we can think how long he might have lasted. Without training he was able to beat in his races the best horse they could bring against him.

It is claimed by some, that this does not show that he was much of a racer, as his races were quarter races. John Randolph said: "show me a quarter horse and I will show you a four-mile racer."

In his drawing matches it is stated he never was beaten. This shows what a powerful muscular horse he was. In considering him as a prepotent sire, and where many a good horse in other respects has failed, it can be asked what horse has left such a mark, such an impression on the horses of New England and the West as has the little horse Justin Morgan? His blood courses in the veins of some of the great trotters more than he has credit for.

At the time he was taken to Vermont, the papers were full of the advertisements of horses that were claimed to be full-blooded horses. The following are extracts from some of the advertisements:

JUNIUS, DARK BAY, SIXTEEN HANDS HIGH, SIRED BY LATH, dam by Wildair. Stood in Vermont the season of 1792.

REGULAR IS WELL BLOODED, BROWN, FIFTEEN AND A HALF hands high, nine years old, sired by Wilkes, grandsire Selim, that at Philadelphia in 1762 won £1,000 against True Briton; dam Nettie, imported from Europe. Stood at Norwich, Vt., the season of 1792.

THE FULL-BLOOD HORSE, HYDER ALLEY, EIGHT YEARS OLD, sixteen hands high. Stood at Randolph, Vt., the season of 1794.

HERALD, SIRED BY THE RUSSIAN HORSE THAT WAS BY IMported Wildair. Stood at Randolph, Vt., in 1796.

SPRIGHTLY CAT; DARK CHESTNUT; SIXTEEN HANDS HIGH. Bred in Virginia. Sired by Col. Vernon out of the imported mare Harmony. Ten dollars the season. Stood in Virginia at $27 the season. Stood near Randolph in 1798.

THE FULL-BLOOD HORSE MARQUIS, SIRED BY THE IMPORTED horse Marquis, out of a full-blood mare. Stood at Randolph the season 1806.

We know nothing in regard to these horses now or the Natal Horse, Old Hero, or the famous Bulrock, except by their advertisements. The Justin Morgan is known by his descendants. Mr. Wallace says: "The Justin Morgan was certainly one of the most remarkable horses of any period," and he says he shall esteem the Morgan blood none the less if the original came from a Dutch horse, and he rather argues that it was so.

If a Dutch horse can eire such a horse as was the Justin Morgan, the English blood horse is of no account and all of Mr. Wallace's labors and teachings have been in vain. But everyone knows that blood will tell, and that the remarkable horse Justin Morgan inherited the best of blood, as his owner's son said, to have been the wonderful horse that he was.

ALLEN W. THOMSON.

The Proposed National Jockey Club.

From present indications it does not look as if the proposed National Jockey Club would assume shape, though Colonel Clark, of the Louisville Jockey Club, who is its prime mover, is still in this city. Tuesday we had a talk with Mr. D. D. Withers on the subject.

"For my part I have no objection to the idea," said Mr. Withers, "but I hardly think a national jockey club will be organized, and I am afraid it would not improve matters any. Wherein is there any necessity for it?"

"It is urged that it should be organized in the interest and for the protection of honest sport, to bring the reputable clubs of the country together in harmonious action, secure reciprocity in the matter of forfeits and rulings, to arrange the dates of meetings so as to prevent hurtful conflict, to frame a gradnating scale of weights for general adoption, and to draft a code of rules."

"That's all very well, but we accomplish nearly all that already without a national club. We reciprocate with each other in the matter of forfeits, rulings, and in nearly everything—there's no trouble about that."

"But on the question of rules; would it not be better to have a national code which would simplify matters and lead to a better understanding, and hence better observance of them?"

"Why, racing rules are the same in substance all over the world. They all are based upon the English rules, whether in the different parts of this country, France, Germany and Australia, with such alterations as are called for by the peculiar necessities of each country. The last English rules cover all the ground. They were adopted in 1876, having been drafted by three eminent lawyers in order that they might have the legal form. The gentlemen, I think, were Hon. Sir H. Hawkins, Right Hon. Sir S. Martin, and Sir R. Wallace, who were made honorary members of the Jockey Club in recognition of the services performed. If we want a national code let us adopt the English. I proposed that to Colonel Clark, but he says we can improve upon the English."

"But would not a national jockey club or a turf congress do much to benefit the turf in many ways, secure united action and keep a check upon delinquents—a club upon the model of the English Jockey Club?"

"It might, but this is not England. Such a club would make great demands upon the time of its members. In England, where it is composed of noblemen and gentlemen of leisure, it's all very well, but we Americans are all, or nearly all, men of business—we haven't the time to spare."—*New York Spirit.*

Five million base balls are pounded to pieces every year in the United States.

On the Road.

The above is the caption of an editorial in the New York *Herald*, which is appended, and is quite a glowing eulogy of the pleasures attending sleighing. Those who have so fervently grumbled over the sharp mornings of last week can imagine the comfort there is in an atmosphere which is so many degrees colder. Wrapped in furs, arctic seal skins and gauntlets to protect the feet and hands, the cold in a measure can be kept out, but there is positive discomfort in so much bundling, and the small portion of the face that cannot be protected is the seat of acute pain. Gliding through the air is enjoyable, and there is an inspiriting effect in the music of the bells. We have seen "grand times" on the ice and the snowpath. We have suffered so that the recollections bring a shiver, and now that the blood flows more sedately must say that enough of that kind of fun has fallen to our share. The "seal skin brigade," as the rich road-drivers of New York are called, can set at defiance Jack Frost when in an ordinary mood.

Artificially warmed stables from which they depart as warm as toast, robed and muffled; the "roadhouse" with glowing grate, hotscotch, flip and mulled ale at the end of the drive; plenty of attendants to cover the reeking trotters, and to have them in readiness to return, and the well-warmed quarters to receive them is very well. But in the country anywhere North of the fortieth parallel, especially in the Western part, where at times the mercury sinks into the bulb, where the squeak of the steel shoes of the sleigh makes a horrid discord to the sound of the bells, and the bays, browns or blacks are all of a color, enveloped in a winding sheet of frost, to "unhitch" in the starlight, and put away in stalls not much warmer than the outside air, and then debate whether it is better to sit up all night or get between sheets that strike clear through to the heart, so terribly cold is the embrace, is a feature of the sleighing not quite so inspiriting.

Contrast this with a drive—not in the neighborhood of San Francisco, as the Cliff House road is a thing of the past—a drive on the other side of the bay. Take the Creek boat, or those of the Narrow Gauge, and you can hardly go amiss in Alameda, and in Oakland turn to the left until you reach Peralta. It is hard though smooth, and those who have their horses shod with tips are not afraid of hard roads, and though the frosts have blighted the leaves of the calla lilies, ruined the heliotrope and scorched others of the more tender flowers, there are a profusion of roses gorgeous and brilliant as those of the East in June. Along Peralta at a forty gait, and if a higher rate of speed is desirable, the Oakland Trotting Park was never in better order. Although there is no road to bowl at a merry pace over, the drive is a pleasant one through the Golden Gate Park, and there is plenty of chance to speed on the Bay District, and when you have had enough yourself you can sit on the veranda of the hotel and watch the others. There is not the crowd, the jam, the rush that "the Avenue" displays, neither the crowd of equine celebrities that are domiciled in New York, and yet there are those which would make a very good showing, and there is the bright sunshine, and though the air be somewhat nipping and eager, it is some thirty degrees above the freezing point:

If the late snowfalls have made travel slow and dull and heavy in the narrow crowded streets of the lower city they have, nevertheless, laid a glorious coating upon the roads of the Park and the avenues beyond, and have filled with delight crowds of people who were on the broad thoroughfares yesterday afternoon with their sleighs speeding along "over the hills and far away" to the glorious music of ten thousand merry bells. Such a picture as was presented in the Park, on "the avenue" and across the bridge to the country far beyond is not often seen. The Park was one crush of sleighs of all classes and styles, from the light racing cutter and elaborate Russian drosky to the eminently democratic American "bob;" they were drawn by everything, from a quiet old family horse, who thought he was being driven to church uncommonly fast, to the impatient roadster, who longed to get free of the Park and the vulgar throng and reach "the avenue" and the congenial company of "the flyers." Above the Park the scene was one not to be equaled on any road in the world. America is undeniably the home of the trotting horse, and in no city in the country are there so many marvelously fast horses as are found in New York. The fine sleighing had thrown wide yesterday afternoon every stable door, and there was upon the avenue one long line of magnificent trotters, led by the two fastest teams in the world—Mr. W. H. Vanderbilt's mares Aldine and Early Rose and Mr. Frank Work's Dick Swiveller and Edward—and closely followed by a crowd of noble animals competing in glorious burste of speed. The sight of this extraordinary gathering as viewed from Macomb's Dam Bridge, looking south over the two-mile stretch, was one not to be forgotten when once seen, and the enjoyment of the spectacle was gladly indulged in by thousands and thousands of sightseers, who crowded every place from which the grand picture could be viewed.

MR. GUNTHER'S SWIMMING HORSE.—Mr. Frederick Gunther, the proprietor of the North Point farm and headquarters of the North Point Ducking Club, is the owner of a remarkable swimming horse. Since June last the horse has accomplished the remarkable feat of swimming from the West North Point Light to Seven Foot Knoll and return, making fourteen miles each round trip. The last feat, and most remarkable of all, was as follows: The horse entered the water at his old familiar point, the West North Point Light, and swam two miles beyond the front beacon light, and near Tolchester Beach. Being headed off by his owner in a four oared boat, he turned and swam to Miller's Island Light, and when he struck bottom rested until Mr. Gunther and a well-known oarsman overtook him. He then again entered the water, and completed the distance back to East North Point Light, making a distance of 19 miles without leaving the water. The horse was purchased by Mr. Gunther at a point down the bay called Chucoteague Island, where he was used to swimming from the Island to the shore with his rider and returning whenever he thought it convenient. Your correspondent rode behind this remarkable horse from Mr. Gunther's farm to Canton, a distance of 13 miles, in 95 minutes.—*Baltimore Sun.*

TURF AND TRACK.

The Spring Events in England.

The English *Racing Calendar* contains the nominations made for the Newmarket, Epsom, Ascot and Goodwood events which closed on the 2d instant. As compared with the previous year they show an increase in numbers, although there is some slight falling off in the number of entries for the events to be run at Newmarket. For instance, the Newmarket Handicap, which Parole brought into such prominence when he beat Isonomy for it in 1879, received thirty-six subscribers last year, but has only twenty-six this year. The only American entry for the Newmarket Handicap, which will be run on April 13, is Mr. Keene's Golden Gate, while among the other nominations are Lord Cadogan's Spring Tide (the winner last year), Mr. Crawfurd's Edelweiss, Strelitza and Bay Archeress; Mr. Chaplin's Wandering Nun; the Duke of Beaufort's Faugh-a-Ballagh (who, it will be remembered, forced Foxhall to make a terrific finish for the Ascot Gold Cup last June); Lord Rosebery's Moidore and Town Moor and Count Festetic's Berzencze (the winner of the Newmarket Handicap in 1881. Among the other Newmarket events which closed on the 2d inst., in which Americans will have interest, is the Babraham Stakes, to be run April 11, and for which Lord Ellesmere has nominated Wallenstein. The distance is about a mile and a quarter, and as Golden Gate is in the same race with several other fairly good horses the race will no doubt add interest to the card of the day, unless the handicapper crushes out all the fairly good ones and lets some "dark 'uns" in with but little more than a feather. For the second spring meeting Mr. Keene has entered Golden Gate for the Newmarket Spring Handicap, "across the flat," but that meeting attracts little attention, other than as a source to bring out opinions as to the Derby, coming, as the meeting does, between the 2,000 Guineas and Derby. The 2,000 Guineas, a fixture for April 25, for which it may not be out of place to say that Bean Brummel and Chislehurst are the selections by a well-known and popular English authority.

Next to the Newmarket Handicap, but as races of more value and importance, the *Calendar* brings the full entry for the City and Suburban and Great Metropolitan, both of which show a total number of entries less than last year, the City and Suburban having 74 as against 75, and the Great Metropolitan 36 as against 40. The Great Metropolitan, the distance of which is two miles and a quarter, will be run on April 17, and the City and Suburban, which is a mile and a quarter, on the day following. The entry for the Metropolitan is an excellent one, and includes Mr. Lorillard's Iroquois, Sachem and Pinafore, Mr. Keene's Golden Gate, and such English cracks as Mr. Crawfurd's Corrie Roy, the winner of the last Cesarewitch; Mr. Peck's Hackness, the winner of the Cambridgeshire; the Duke of Hamilton's City Arab and Fenelon, Lord Bradford's Retreat, Mr. R. Vyner's Hagioscope, Mr. R. Jardine's Reveler and Shrewsbury, and Lord Rosebery's Vista, who ran a dead heat with Wallenstein for second place for the Shrewsbury Cup in November, the winner, Mr. R. S. Evan's Fairkirk, only beating them by a head. The entry for the City and Suburban shows a decidedly mixed lot, and includes a number of names not known on this side of the Atlantic, and with which even English followers of the turf have but little acquaintance. Mr. Lorillard's stable is represented by Iroquois, Aranza, Sachem and Pinafore. Mr. Crawfurd has eight, including St. Marguerite, the winner of the 1,000 Guineas last year, and Buchanan, the winner of the Lincoln Handicap in 1881, and the second last year. Among the others is last year's winner, Lord Rossmore's Passaic, by Longfellow out of Jury, and as Foxhall is also in, the American breds will be very near the top weights in the handicap with the Duke of Westminster's Shotover, the winner of the last 2,000 Guineas and Derby in close company, where also will no doubt be found Scobell, Lowland Chief, Boswell, Hackness, Roysterer and others. In fact the handicap will as a whole be, without doubt, a heavy one. Of the other important fixtures for the same meeting, viz.: the Great Surrey Handicap and the Prince of Wales Stakes—the latter a welter handicap—the Americans are only in the former, which is a dash of five furlongs. They include Mr. Lorillard's Sachem and Aranza. For the summer meeting, which will begin May 22, with the Derby fixed for the 23d, the Epsom Grand Prize for the 24th and the Oaks for the 25th, the only event which closed on the 2d and in which there is special interest, is the Epsom Gold Cup over the Derby course, which it will be remembered Parole won in 1879. The entries for the current year number twenty-two, and include nearly all of the best in England, Mr. Lorillard entering Iroquois and Sachem; Lord Ellesmere, Wallenstein and Boewell; Mr. Lefevre, Tristan; the Duke of Westminster, Shotover; Lord Rosebery, Town Moor and Kermesse, with sealed nominations by the Duke of Hamilton and Mr. Leopold de Rothschild.

The meeting at Ascot will begin on Tuesday, June 5, and continue on the three following days. On this side of the Atlantic the interest in the meeting will center in what the American two-year-olds may be able to do, and on the races for the Gold Cup and Alexandra Plate, the other important all-aged races not closing until later in the year. The entry for the Gold Cup, two miles and a half, to be run on the third day, numbers 36 as against 23 last year, while for the Alexandra Plate, three miles, to be run the day following, there are 22 entries as against 21. The entries for the Gold Cup include last year's winner, Foxhall, and the other two starters, Faugh-a-Ballah and Petronel. Among the remainder are Iroquois, Sachem and Pinafore, with Wallenstein, Corrie Roy, Dutch Oven, Tristan, Shotover and a score more of good horses with several sealed nominations, while for the Alexandra Plate the entry is nearly the same including Iroquois, Sachem, Pinafore and Wallenstein, with three sealed up by the Duke of Hamilton, who won the race last year with Fiddler, a son of old Preakness. For the All-Aged Stakes, to be run the same day as the Cup, over the T.Y. C. (5 furlongs, 136 yards), Mr. Lorillard has entered Iroquois, Sachem and Pinafore, the field, as a whole, not being remarkably strong.

The only all-aged stake to be run for at Goodwood—the meeting beginning July 31—for which the entries were published on the 2d inst., was the Lennox Stakes, to be run on the second day of the meeting. The distance is three-quarters of a mile straight, and among the twenty-nine entries are Iroquois, Aranza and Sachem. For the Findon Stakes, for two-year-olds, over the same course, to be run on the same day, Mr. Lorillard nominated De Soto, Choctaw, Nirvana, Vixtrix and Nitocris.

The Christmas number of the San Francisco BREEDER AND SPORTSMAN was a very creditable issue. The proprietors of that journal propose to make it the best and most reliable journal of its class published anywhere, and from may judge of the future by the past they will surely succeed.—*Lakeview (Or.) Examiner.*

Tom Cannon's Stable.

Without exception Tom Cannon has the longest string of horses of any trainer in England. The total, not including Mr. Lorillard's lot, number sixty-nine head. Mr. Lorillard's string is as follows. Five years old:

Aranza, b m, by Bonnie Scotland—Arizona.
Iroquois, br h, by Leamington—Maggie B B.
Four years old:
Pinafore, ch f, by Enquirer—Mollie Rogere.
Sachem, ch c, by War Dance—Sly Boots.
Three years old:
Comanche, b c, by Virgi of Glenlyon—Chiua.
Massasoit, b c, by Glenlyon—Marie Michon.
Touch Me Not, ch f, by Great Tom—Woodhine.
Parthenia, b f, by Alarm—Maiden.
Siddartba, b c, by Pero Gomez—Pearl.
Wenonah, ch f, by Glenlyon—Pussy.
Winnehago, ch c, by imported Glenlyon—Opponent.
Choctaw, b c, by imported Saxon—Fauny Lndlow.
Two years old:
De Soto, ch c, by Wanderer—Kstie Pearce.
Emperor, br c, hy Enquirer—Vesper Light.
Nirvana, b f, hy Saxon—Virginia.
Nitocris, br f, by Glenlyon—Highland Lassie.
Pontiac, blk c, hy Pero Gomez—Agenoria.
Vixtrix, ch f, hy Glenlyon—Vixen.

When Mr. Lorillard's yearlings (those sent over last October) set foot ou English soil they presented a very sorry appearauce, and on arriving at Houghton a very poor opinion was tbe general verdict. According to all accounts, however, tbe juvenile Yankees have improved in an extraordinary degree since tbeir sojourn iu Hampshire, and a very different cbaracter is now given of them. Included among tbe old stagers is Iroquois, a dnal winner of the Derby and Doncaster St. Leger, but he was nnsound during the greater part of last season, and it was only the result of an aftertbought tbst he was put into training again, the intention baving been that he should have returned forthwith. Whether he will stand agaiu we, of course, are not in a position to say, bnt if he does, and if he can be got back to his three-year-old form, he will yet do honor to Mr. Lorillard's haudsome colors. Sachem is a useful sort of customer tbat might, perhaps, make a nice bandicap horse, but tbere does not appear to be anything very gay among the remsinder, thongb tbe circumstance of Abbotsford and Wallenstein having turned out so well when snbjected to a conrse of English preparation should at least be encouraging to their present trainer.

Trotting in Australia.

The following notes of races at the Victoria Trotting Club meetiug on Dec. 2nd last, are from the *Federal Australian:*

A beautiful afternoon tempted a good many to patromize the programme offered hy the club, and many ladies wituessed the sport. To suit all tastes on this occasion galloping races were introduced into the day's fun, and this experimeut was so successful that at all future meetings some galloping events will form a part of the bill of fare. Sport opened with the Maiden Trot, of two miles, for which Wasp, Maid of Mona, and Little Dick were all backed. The latter began slowly, but fairly trotted away from his field at the finish. The trot for the 2:50 class, in two-mile heats, introduced the American mare Sylph, who won the first heat in great style from Leithamstead, who trotted under protest, on the grounnd that in the Handicap Trot at Sandhnrst he had heaten the 2:50 record. In the first heat Leithamstead disappointed his friends sadly, and never seemed to get on his legs, the mare coming home alone in 5:49, hut in the next heat the grey went from the jnmp off, and won quite as easily in 5:36½, and in the third heat the mare broke repeatedly, and he won easily iu slower time.

A great deal of admiration was elicited by the appearance of the recently imported American trotter Honesty, who was on the ground. This powerful dark chestnnt horse shonld pay his way here if looks go for anything. Below are details:

MAIDEN TROT.

Purse of 25 sovs. and sweepstakes of 1 sov. each. Two miles.
Mr. M. B. Jenkins' ch h Little Dick, aged, by Daniel Boon (Collins)....1
Mr. P. G. Dixon's br m Maid of Mona, aged (Giles)....2
Mr. A. S. Johnston's b g Happy Jack, aged, (Roddy)....3
Mr. W. Bland's ro m Wasp, aged, (Alhurgh)....0
Mr. E. M. Bond's pod g Prince B, aged, (Owner)....0
Mr. A. Bnngard's ch m Lady, aged, (Grimwood)....0
Mr. G. C. Hall's brm Lady D, five years (Hall)....0
Time—6:07.

Betting: Two to one against Wasp, three to one against Maid of Mona, seven to two against Little Dick.

Purse of 50 sovs., for 2:50 class, added to a sweepstakes of 3 sovs. each. Two-mile heats.

Mr. D. Collins' gr g Leithamstead, six years, by Alarm (Brady)...2	1	1	
Mr. J. A. Roberts' b m Sylph, six years, by Reliance (Mulholland)....1	2	3	
Mr. J. J. Miller's br m Fright, by Alarm (M. Griffin)....3	3	2	
Mr. R. Foster's gr g Teviot, aged, (Foster)....0			

Time—6:49, 5:36½, 5:45½.

Clingstone's Sickness and its Treatment.

My first knowledge of Clingstone's late illness was on November 18th, my attention heing called to him by Mr. George W. Sannders, who told me that there was a discharge of pus from the animal's groin. On the following day I made a careful examination of Clingstone, and soon discovered the presence of a large fibrous tumor, which extended as high as the abdominal riug, and also had a small fistulous opeuing at its lower end. I prepared Clingstone for the operation which I decided to perform by giving him no solid food, restricting him to cooling and laxative diet for three days. On November 22d, I cast him and secured him firmly by means of side lines, etc. I then proceeded to operate with the assistance of Dr. R. C. Hutchings, my business associate. I dissected the tumor from the healthy structures, placed the flat cam on the healthy spermatic cord about an iuch and a half above the tumor, canterized the end of the cord, ligatured the arteries, and then immediately relcased the horse.

Tbe tumor was purely of a fibroue character, ae reported hy Dr. J. H. Salisbury, who made a microscopical examination of the tissue. The weight of the tumor was twenty-four ounces, length about six inches, and it was of oval shape, largest at the lower end.

Tbie tumor was doubtless the result of improper castration by the caustic clamp, the operator on removing the clamp having neglected to separate tbe adhesion which always takes place betwecn the end of the spermatic cord and the skin of tbe scrotum. It might, however, have ariseu from some debility of tbe cremastic mnscle or by leaving the cord too long, and its becoming imprisoned within tbe scrotal wonnd causing irritation and inflammation, followed by the formation of tbie fibrous tumor. I understand that Clingstone was gelded some five years ago; cousequeutly this tumor had been gradually growing until its removal.

Clingstone's stall hae heeu heated by artificial meane since the operation, and he has made a very rapid and exceedingly satisfactory recovery. He ie to-day perfectly well.—*Dr. W. Paul in Breeder's Gazette.*

New York Letter.

EDITOR BREEDER AND SPORTSMAN: In my last letter the dearth of sleighing during the previous month was commented on, as ehowiug up the keen disappointment tbe same had occasioned our metropolitan road men who handle the ribbons daily over some of the fastest trotters in the country, representing a cash value or over a million of dollars. Hardly could the ink of my "lamentstion" have been dry before the slowly and steadily falling feathery flakes of white showed New Yorkers that another big fall of snow was imminent, and sure enongh, the last two weeks have seen the roads in as fine condition for the runners as the most ardent road-rider conld wish, he he John Gilpin himself, although tradition does not state, I helieve, whether that worthy was partial to sleighing or not. Be that as it may, the Bonuers, Vanderbilts, Works, Stokes, Gen. Grant, the Maces, Fister Dewey, Shep. Knapp, and all the rest of the multitude are, beyond the shadow of a doubt, and they have made the snow fly in all directions on Seventh avenue, Jerome avenue and the boulevards leading from Central Park.

The entries for the stake of the Coney Island Jockey Club, which closes on the 2d prox., have just heen made public, and show a large increase over tbose of last year. The Coney Island Cup shows 22 entries against 28 last year, which is the only one tbat has fallen off. The others are filled with an average 50 to 60 entries each, embracing some of onr best known racers.

Tbe popnlar Autumn Stakes for two-year-olds (run at the September meeting) has the great entry of seventy-six, comprising the flower of onr young stock, the Santa Anita stable being represented in this and other of the fixtures.

By the June meeting the club expects to have new stables built that will bring their stabling capacity up to room for nearly six hnndred horses, which will obviate a recurrence of the complaints tbat were made last year, when several stables conld not get room at the gronnds.

The entries at Lonisville also closed with a very gratifying exhibit, and foreshadow what mnst he one of the most successfnl spring meetings ever given at the Falls City. At Lexington the trotting stakes that recently closed there show the nsnal full list. The hlue-grass breeders have rallied well to their home standard, and intend to dispnte every inch of the track with the young California flyers from the sunny slopes of Palo Alto, a large draft from which have entered the lists. The catalogue of Palo Alto shows to what an extent Gov. Stanford is carrying on the breeding of fine horses. Pierre Lorillard's Rancocas stock farm at Jobstown, N. J., where the thoronghbred is given almost the exclusive attention, has often been mentioned as the largest place of the kind in the country, but there is evidently not so mnch capital invested there as there is at Palo Alto, its rival of the Pacific coast, where, as is well known, the contrary state of affairs exists to that at Rancocas, namely, the trotter is given the preference over the thoroughbred. Electioneer, the half-brother to Prospero and the other noted progeny of the old hero of Chester and the famous Green Mountain Maid, has fairly earned his proud position as a great sire of trotters. For precocity his stock are without rivals in the wide world, and that they will train on, with proper hnshanding of their powers, there is no reason to doubt, although in any State East of the mountains such early handling of younngsters would he almost certain to result in impairing their futnre speed and stamiua. In California, however, where the "glorious climate" matnres horses early, nature seems to favor the horses in every way, and it is destined to be a great breeding State. No snch collection of hroodmares as is to be found at Palo Alto exists anywhere in this country, and they are certainly a priceless lot, of which their popular owner has reason to feel very prond.

The New Orleans will positively commence on Saturday next, the 20th, as I advised yon in my last. Everything is in readiness and good racing is confidently expected from the character of horses there. Several of our best jockeys have gone down, among them Donohne, Shauer, Quantrell and others. Tbe latter boy was ruled off at Saratoga last summer, hut will probably he reinstated this month, and ride for the Cassidy Stable of St. Louis. Most of the knights of the pigskin have made their arrangements for the year. Feakes, Shauer, Costello, etc., of course remain with their old employers the Lorillards, Pierre having also the second call on "Billy" Donohne's services. Snedeker & Co. have answered the first call on this talented jockey, whose forte is getting away and finishing. Evans rides again this year for the Kelso stable and perhaps also for the Erie stable of W. L. Scott. Barbee will divide his time between the Pelham stahle and that of I. E. Kelly, the last named tnrfman letting Hughes go, probably to Gov. Bane at Fairview, Mo. The two Messrs. Laughlin, James and Frank, seem destined to become life fixtures of the Brooklyn stahle of the Dwyers, no more attempts being made as was the case two years ago to induce them and Roe to sever their connection with the etahle that has made them famous or that they have made famous—which is it? The Baldwin stahle of your State has a first-class pilot in Cyrus Holloway. Cy will get as much out of the horses as there is in them.

Mr. Withers' Brinkdale stud will have, as formerly, the brothers Sparling, hoth good boys, and Wolfe, formerly with Green Morris.

One of the best known of American jockeys was Barrett, who was identified with most of the great races of Parole in this country. He rode the famons geldiug when he wou tbe great eectional race against Ten Broeck and Ochiltree at Baltimore in 1877, and the crowd carried him around the lawn on their shonlders. They would have carried the horse too if he would have permitted tbe familiarity. Poor Billy of late years found great difficulty in wasting enough to ride at the weights now in use and the attempts to do this broke down and enfeebled his system to such a degree that consumption had no difficulty in marking him for its own, his death occurring at his New Jersey home on the 6th inst. Poor Billy! and many others like him might be spared to have long and useful lives if the powers that bo would only raise the weights to a yet higher standard, for that they are still too low nearly all disinterested parties helieve.

Old Sam Purdy, the famous hrown stallion from your coast, is standing for mares in Virgiuia at the farm of a relative of the Keene family. Though not as fast perhaps as some of the horses of his day, the son of Patchen Jr. and Whisky Jane was as game as flint and, if the heats were split, could outlast faster horses than he. The last race the writer saw Purdy trot in California was his wagon match with Rarus over the Bay District Course, and thongh Rarus was much the faster horse at tbat time, when the stallion laid back his ears in answer to Dohle's call even Splan and his "camel" horse knew tbat if they wanted to beat him tbey must keep on "hurrying."

The roan gelding Slow-go, record 2:18½, who flourished about the same time as Purdy, is dead. His stable at Pittshurgh was flooded recently and the horse caught cold and never recovered. He was another of the same sort as the California hrown; no race was too long for him. Slow-go was nearly or quite thoroughbred if I remember right, anotber nail in the (journalistic) coffin of old Wallace.

Mr. Dugald J. Bannatyne of New Jersey is in fresb trouble. His exploit of last summer will be remembered, when he endeavored to have tbe Monmouth Park race-track indicted as a public nuisance, etc., and many charitably supposed at tbe time that his action was not actuated by malice, but that he was nnder bad influence, or getting a little cbildish. It seems however, tbat he is still obtruding his failing before the public, for yesterday Wm. Pryor, the trainer, was awarded $1,000 damages against him for defamation of character, etc. Truly some of Mr. B's friends ought to look after him, for in his day he was widely and favorably known. Many of yonr readers will remember Mr. Muybridge, the portraitenr of tbe "horse in motion." He gave a lecture on that subject at the Turf Club this last week, and it excited considerable attention here. We had quite a novelty here of another sort last Sunday morning. The "boating parson" as he is called preached his installation discourse from the pulpit of one of the oldest and wealthiest places of worship. The reverened Mr. Rainsford who but a few years since pnlled stroke oar for tbe victorious Cambridge college crew in the annual race for University honors on the Thames, stands six feet four in his stockings, is a model of an athlete in every way, and believes in robust Cbristianity. His parishioners appear to have taken a great fancy to him, and judging by his late record in Montreal not without reason.

Our metropolis is having an exceedingly brilliant theatrical season this winter, and when the several new tbeaters now in process of erection here are completed we will fairly rival London and Paris in this line of amusement. Ed Stokes, backed by Juo, Mackey, it is said, is building a handsome edifice on 23d street, nearly in the rear of the Fifth Ave. Hotel. He intends to erect a theater tbe peer of any in New York. Tbe inevitable Morse on tbe other side of the avenne is nutting in over another building to produce the Passion Play in, he says, but the city fathers say no, by a large majority. The Madison Sqnare tbeater has a delightful episode of domestic life in its play of "Esmeralda." No better bit of acting than the Mrs. Chetwynd of Agnes Booth has been done in this city. A very powerful play also of a rather different style was tbe Rantrau's, played at the Union Sqnare theater until within a few days. It portrayed tbe evils of family bate, and one or two of its situations were dramatic in the extreme. Such plays as these reach many a heart that the pulpit does not, and in this way are mnch healthier than the modern French drama. But the latter often draws the best, and an average stage manager generally looks to the profit, not the moral of his play.

Manager Stetson of the Fifth Avenne and Booth's has suetained qnite a misfortune in the severe illness of Chas. R. Thorne Jr., who had to give up his part in the revival of the great play of the Corsica Brothers. Mr. H. Bays, however, aided by Mr. Theo. Hamilton, lately from Australia, has filled the void well, and the attendance is very large, the mechanical efforts of the piece being almost perfection.

Lester Wallack is playing to large honses at his own beautiful place of amusement, and Mr. Daly at his theater is having his share of success also with one of the very old comedies of Colley Cibber, "He Would and She Wouldn't."

Wm. Henderson at the Standard is playing "Iolanthe" to good business and the same may be said of the Comique, where one of the management's well-known satires on Metropolitan affairs is filling the house and the coffers nightly.

New York, Jan. 17, 1883. PACIFIC.

ATHLETICS.

Merion Field Day.

The field day of the Merion Cricket Club will take place on Feb. 22d at the Recreation Grounds, which will be nnder the exclusive control of the Club on that day. The programme is as follows:

1. One hundred yards scratch race, students San Francisco grammar schools.
2. One hundred yards scratch race, students San Francisco high school.
3. Running high jnmp, open.
4. One mile hicycle race, handicap, open.
5. Throwing cricket ball, cricketers.
6. One hundred yards handicap race, open.
7. Kicking football, open.
8. One-quarter mile handicap run, open.
9. Standing wide jump.
10. Walking match, one mile, open.
11. One hundred yards club race.
12. Rnnning long jump.
13. One mile race, handicap, open.
14. Jnnior archery contest (under 18), open.

The prizes will be gold and silver medals. The officers of the club are: President, W. Laue Booker; Vice President, John Theobald; Captain, B. S. Benjamin; Vice Captain, F. Finlayson; Secretary and Treasurer, C. B. Hill. The committee to arrange preliminaries of the coming field day are B. S. Benjamin, J. B. Benjamin, F. L. Mathieu, C. Creighton, C. B. Hill. Entries to the open events will close on Saturday, Feb. 17, with the Secretary at room 16, 606 Montgomery street.

C. A. J. Queckherner, the well-known weight-putter and hammer-thrower, was recently presented with a silver medal for having saved a number of lives during the past season at Long Beach, where he was engaged as a life-guard. He is expecting two gold medals from Congress for the same acts. Ahont this time last year he was presented with one gold and one silver medal for having, during the previous five years, saved thirty-four lives.

A movement is on foot amoug those interested in athletics to send John Meagher to England to compete against Raby, Franks, Thatcher and other English walkers. Meagher, it will he remembered, recently defeated Dennis Driscoll in an hour's walk at the Manhattan Athletic Club gronnds and made the best record in the world for a race of that kind, while Driscoll also covered more than eight miles in the hour.

Thomas F. Delaney, who recently beat W. G. George a minute more than his handicap in a ten-mile race, has left the Gramercy Athletic Club and has joined the Williamsburg Athletic Club, under whose colors he will run during tbe season.

ROWING.

Saying and Doing.

Some condensed truth by Peudragon in the *Referee*: News comes from America that Hanlan and the fabled Kennedy are at last matched to row for a money stake. Articles have been drawn and money deposited, and to all outward show it looks as if this time "business only is meant and not bouncing." I am sorry to dash the hopes of those who look upon the negotiations as satisfactory in every way, but the articles of agreemeut as drawn are not worth the paper on which they are written. Neither the place of rowiug nor the date is as yet settled. The referee has, in the cvent of the contracting parties disagreeing, power to name the place; but there his power ends. Suppose he, finding the men themselves cannot fix upou one, names a suitable stretch of water, it is competent for either Hanlan or Keunedy to say, "All right; and a very nice stretch, too. I'll row there nineteen years hence, when the kye come hame and bring the Greek Kalends with them, when the procession of the equinoxes is just about to renew itself and when I've quite made up my mind that I've got the best of the hargain." The fact that articles have to be drawn at all proves that they cannot be drawn too strictly. When the Earl of Brown and Viscount Jones, Lord Smith and the Duke of Robinson, engage to run their horses for 1,000 sovs, h ft. R. M., or elsewhere, no articles are drawu; neither are they when Bottled Porter Esquire, matches himself to row or run Drug Store, Esquire, Measuring Stick, Esquire, or Cash Collector, Esquire. But then these are noblemeu and gentlemen, and have to behave "as sich." The case is altogether different with professionals who look with an oblique gaze upon the world and its business arrangements, and who consider it part of their hounden duty to wriggle and twist and go back ou themselves directly they find they have any the worst of an engagement.

Years ago, when a man deposited his money to make a match it was understood if he didn't go on he would have to forfeit. But a practice grew np of pretending to go on and of putting such obstacles in the way of the oppositon that the money had to be drawn ultimately. This is why no match is considered made until articles are signed, sealed and delivered—this is why articles have to he drawn so strictly. Would any man go to the post when 10 to 1 is on offer against him, and he knows he has made a bad match, unless compelled by the articles of agreement? And will either of the men in question, Hanlan or Kenuedy, agree to a given date, if between now and next summer one or the other of them discovers he is mistaken in his estimate, and that he has taken on the wrong customer? I fancy not, whatever other folk may fancy. If Hanlan and Kennedy find that sufficient money is subscribed to make their race pay both, no matter who wins or who loses, they will row; but if there is no such pleasant prospect, then we may depend that the want of a date will lead to the project fading out as so many other and similar projects have faded out already.

At a meeting of the Execntive Committee of the National Amateur Oarsmen's Association, at the Gilroy House, New York, on the 13th inst., Mr. Cattinac, of the Narragansett Boat Clnb, was by resolution disqualified as an amateur. A committee will be appointed to make arrangements as to where the next open regetta will be held, the preference heiug for the Passaic course at Norfolk, N. J., provided proper arrangements can be made.

YACHTING.

The following officers of the Lolita Yacht Clnb have heen elected for the ensuing term: President, Geo. Crawford; Vice-President, W. Carman; Treasurer, E. H. Haughton; Financial Secretary, C. Schelitz; Recording Secretary, W. Granhoff; Sergeant-at-Arms, S. Cohen.

The keel of Tevis' new yacht has heen laid, and, her timhers being ready, she will soon he in frame. This will probably be one of the best built yachts ever put up on this Coast. Everything is of first class and she will he as stroug as it is possible to make her.

There will be several changes made on the Aggie's rigging next snmmer. Her hooms are to be lowered so as to bring the sails lower down. It is thought that this will help her. The skylights will be cut down.

The cabin of the new forty-foot schooner heing built hy Stone is nearly done. Yonng Stone is doing the work on her, his father being engaged on Mr. Tevis' new yacht.

Ex-Commodore Ogden, of the S. F. Y. C., has gone to London from New York, hut will probahly he out on the Coast again in a few months.

Clem Uhler, well known among San Francisco yachtsmen, wishes he was back from New York again so as to have a cruise in our waters.

A new kind of paint has heeu tried on the Chispa's bottom which is said to keep off barnacles and grass very well.

Work is steadily going on with the Spreckles yacht and it will not be long now before it will be entirely finished.

The Mist has heen on the heach and been cleaned hut is again lying at moorings in Oakland Creek.

The sharpie Daisy has not had her sails unbent this winter but she has not been used much.

The Frolic has heen in commission all wiuter, her sails not having been unbent.

The Whitewing, Mollie and sloop Nellie all lie in Channel street near Turner's shipyard.

The Bessie has come down from the marshes to Oakland creek.

The Lolita will remain up river for another mouth.

The Ariel has heen up in fresh water for a while.

The schooner Nellie is np in Petaluma creek.

Farmer has a new plnnger nearly completed.

Local yachting matters are rather dull.

The Chispa has heen up river.

There will be some winter racing at Bakersfield course on Feb. 3, 22 and 23. On the first date a dash of a mile for saddle horses is the event. On the 22d a purse will be given to all two-year-olds owned in Kern county, heats of half a mile, and on the 23d a sweepstake open to all Kern county horses, heats of a mile.

THE STAGE.

This evening will be given the last presentation of "Michael Strogoff," that has beeu a success at the California, and on Monday next will be revived for one week only, the gergeous aud amusing spectacular play of "The Tour of the World in Eighty Days" with new scenery, gorgeous costumes and novel spectacular effects. It is safe to say that with such additional attractions this popular picce will regain the pristine favor with which it was received on its production in San Francisco.

At Emerson's the Minstrels, with constant iufusiou of novel acts and songs, continue to do a very satisfactory business. Johnson and Powers show considerahle talent in their song and dance specialties, and form a very valuable additiou to the troupe. Next week there will be an entire change of programme, that will serve to introduce six new claimants for public favor. William Courtright and J. Carroll Johnson are said to he extremely clever as eud men, as is Burton Stanley in burlesque, and D. R. Hawkins will act as interlocutor. The variety interludes will consist of Emerson and Reid in new sketches, Walsh and King in their clog dances, and the California quartet and other attractions and the performance concludes with a new burlesque entitled "Araminta's Wedding." Robert Eberlee, the manager, deserves credit for the complete manner in which the various productions are brought forward for the public approval.

Once again has the Grand Opera House come to grief, hut this time the misfortune must be attributed far more to reckless management and to improvident expenditure rather than to a lack of puhlic patronage. The short control held hy Messrs. Andrews and Stockwell, has proved conclusively that this house can be placed on a firm and paying hasis in a field of its own, when conducted on prudent but yet liheral principles. The production of "Youth" was so successful as to impart great confidence in the drawing powers of melodrama, the theater being thronged nightly in all parts, as the moderate prices drew great crowds of ladies and children who are seldom seen at the more expensive establishments. The drama was admirahly mounted, but the company was scarcely up to the requirements of the principal parts, but still it gave great satisfaction, and the result shows that, if conducted on the plan of the London Standard or the St. Martiu of Paris, with a set of artists who are well adapted to strong melodramatic work and not too exacting in regard to salaries, the Grand Opera House could yet be made a financial success. As it is, the theater will be closed again, the company giving three more performances of "Youth" ou their own account, they taking place this Saturday matinee and evening and tomorrow, Sunday. It is to be hoped that the public will be liberal in their patronage, so that the artists, musicians and other people may be paid up in full.

Dramatic Notes.

It is to be feared that the hrilliant dramatic career of Char. R. Thorne Jr., has heen hrought to a premature ending. For mouths past it was rumored that his health was failing and last week on the first presentation of "The Corsican Brothers" at Booth's Theater, New York, he got through the performance with the greatest difficulty and was prostrated the next day with a serious illness that is reported to be gout in the stomach. Charles Thorne may be said to have gained his dramatic spurs on this Coast, and this sad news will he received with regret by his many admirers.

John Stetson in this emergency telegraphed to James O'Neil asking him to assume the part of the twin brother and to name his own terms, but he was obliged to decline as he could uot cancel his engagements in "An American King" in which he is now starring with fair results, through the Eastern States. The part is now taken by F. C. Bangs, but as yet in it, he has failed to score a success.

Lester Wallack resumes the control of his old theater in New York and will prohahly devote it to combinations, filliug in vacant dates with attractions in which he cau utilize the services of those members of his stock company who are not in the bill of the up-town theater. This will give a chance to Miss Rose Coghlan, whose talents have been hidden under a series of hushels, during the past season, and it is to be hoped that she will be fitted with a part like "La Belle Russe" which will serve to enhance her reputation as one of the best actresses on the English stage. It is reported that this pleasing artiste will come here on a starring tour this summer and if such be the case, she may rest assured of meeting with a cordial reception from her host of admirers on this Coast.

The "Esmerelda" party had a narrow escape at the Milwaukee fire. Luckily, Charles Frohman, who was in charge, found accommodatious for most of the company at the Depot Hotel and there were but four members who were housed at the Newhall. Mr. Crompton rescued Miss Herbert by carrying her down the fire escape, and Mr. Lavelle piloted Miss Duulap successfully along the corridor, and dowu the main staircase through the smoke and flame. The gentlemen were somewhat bruised and scorched and the ladies were prostrated from the nervous effects arising from such a narrow escape from a fearful fate.

The experience of the past season shows that good female artists cannot star successfully with the well-worn, old time pieces. Thus Miss Katharine Rogers recently canceled the remainder of her dates for the season and returuod to New York, aud even Miss Ada Dyas with a company that numbered Mr. Hollaud of the Grover troupe, Barton Hill, and other good artists, played to losing husiness in such pieces as "An Unequal Match," "London Assurance," aud other by-gone successes. The management is said to be out ahout $3,000 on the season, hut the engagements in somo of the more profitahle cities will, it is hoped, reduce these losses. Miss Ada Dyas joins the Madison Square Theater next season, as does Mrs. Lingard, who is also tired of her starring career.

Miss Jefferys Lewis has been more successful with "La Belle Russe," and although the business has not been np to the expectations of the maugemeut, the foundation has been laid for a very promising returu next season. Mr. Goodwin has bought out John Stetson's interest for $1,000, and has thus acquired entire control of one of the best society dramas of the day, despite the unanimous condemnation of the dramatic scribes of New York, who are not always correct in presaging failure or success.

In German circles there is much interest felt in the approaching debut of Madame Ellmenreich at the California Theater, that takes place on next Monday week. From reports it appears that the lady has but a very slight foreign accent and with her undoubted dramatic talent she ought to assume a very prominent position on the American stage. For her own sake we hope that she will carefully eschew Shakespearean parts, although the critics in the East are loud in their praise of Madame Modjeska and Mademoiselle Rhea in such roles as "Juliet," "Rosalind," "Viola" and "Beatrice." To our mind it is time that the masterly creations of Shakespeare should ouce more he delincated by artists, who, at least, can seize the author's meaning and who will not mouth with foreign jargon the beautiful lines that are as familiar to us as "Household Words."

THE KENNEL.

Stanislaus Coursing Club.

The level plains of the San Joaquin valley in the neighborhood of Stanislaus county offer nnusnal facilities for the royal sport of coursing, and it has long been a matter of suprise that the men of Stanislaus did not take some steps to enjoy the sport in an organized manner. Messrs. J. Finnigan, T. Carmichael and V. B. Dale of Modesto are evidently of a similar mind, for last Satnrday they held a meeting and organized the Stanislans Conrsing Clnh, the first coursing club ever organized south of Livermore. When these gentlemen are at work they do it thoroughly and at once they set about arranging for a coursing match. It was agreed to run au open match on February 10 for a purse of $50, entrance open to all dogs in the State, with a fee of $5. First prize, $25; second, $15, and third, $10. Entries to be made with B. B. Garner, Modesto. National rules to govern. We wish the new club a long life and a prosperous one. There is room for many more clnhs in this State and we hope in time to see so many that coursing will take its proper place at the head of outdoor snorts for gentlemen. By next spring the clubs should he ahle to arrange for a joint Waterloo with at least sixty-four dogs on the card.

The Challenge Accepted.

Mr. J. F. Carroll's sweeping challenge to run his dog against any dog in the State or to match four against any other four for $100 a race did not long remain without an acceptor. Last Tuesday Mark Devlin made a trip up to the city from his home at Colusa station and called at this office with au acceptance of Mr. Carroll's challenge. Later in the eveniug Mr. Carroll and Mr. Devliu met aud arranged all the preliminaries of the match as follows:

J. F. Carroll matches his w d Monarch against Mark Devlin's w and bd d Chief of the Cauyon for $100 a side, best two courses in three. The match to he run off at Byron Station near Point of Timhers on the S. P. R. R. overland route, on February 27th. When it came to the selection of a judge Mr. Devlin named John Sellery and that gentleman proving agreeable to Mr. Carroll he was iustantly accepted. Mr. Devlin put up $100 to cover the challenge money put up by Mr. Carroll. The BREEDER AND SPORTSMAN was agreed upon as final stakeholder and the $200 is uow in the hands of the editor.

This match will be very interesting. Monarch has twice taken first honors in the matches of the California Clnh and Chief of the Canyon is a double winner in the Pacific Cluh of which Mr. Devlin is President.

A Voice From Dixon.

TO THE BREEDER AND SPORTSMAN: In reply to the Coursing Challenge of Mr. J. F. Carroll, we will match Blue Jacket against either of Mr. Carroll's greyhounds, best two in three courses, for $100 a side, the match to he run off at Dixon, February 22, 1883, at the regular course, Mr. Chas. Gordon, of Modesto to judge the match. We will remit you $100 by express as soon as Mr. Carroll names his day. Yours Respectfully,

DIXON COURSING CLUB,
S. Briukerhoff, President.

Dixon, Cal., Jan. 24, 1883.

Mr. Carroll Replies.

EDITOR BREEDER AND SPORTSMAN: In reply to Mr. S. Brinkerhoff (of Dixon) accepting my challenge to run his dog Blue Jacket against any of my greyhounds I must say his liberality is only exceeded hy his good looks, for he not only names the time of the race, but he names the judge and place of meeting. I thank him for allowing me the privilege of naming my dog but respectfully decline.

Now, as I have matched my dog Mouarch, against Mr. Devlin's Chief of the Canyon, for $100 a side, best two in three courses, race to come off at Byron, Feh. 27, 1883, I will match Paul Joues and Stonewall Jackson against any two greyhouuds in California for the same amount. Race to come off at the same time and place, the judge to be agreed on, this challenge to remain open for one week. Call at the Captain's office, gentlemen.

J. F. CARROLL.

DOG SHOW AT WASHINGTON, D. C.—At length Washingtou is to have a live dog show. Arrangemeuts have just beeu completed for an exhihition on a large scale at the building known sa the Skating Rink, commencing on February 20th, and to continue four days in all. Classes will be opeued for every hreed of dogs in America, with extra classcs for foreign animals. A special prize will he offered for the best dog exhibited hy the ladies of New York, Philadelphia, Baltimore, and Washiugton.

A match for $100 a side has been made hetween A. Wolf's dog "Marks" and P. Monahan's dog "Spotty," two Stockton coursers, aud the race will come off to-morrow (Sunday), either at Ross Sargent's ranch or near Lathrop.

A large and handsome young mastiff hitch (Tiney, eleveu months old), weighing one hundred and thirty pounds, has been recently imported from Belfast, Ireland, by Mr. Wm. Wade, Pittsburgh, Pa.

Mr. W. A. Irvin, of El Paso, Texas, offers a liberal reward for the recovery of his Llewellin setter dog Dan, recently stolen hy some person.

Geo. Bement of Redwood City disposed of an Ayrshire bull, two years old, and one Ayrshire heifer to parties in Petaluma last week, for $200 each.

HERD AND SWINE.

Grasses and their Cultivation.

In the West pastures can not he permanently held as they are in the moist climate of England. This has long been known, and that acute observer, Prof. Turner, once stated that his blue-grass pasture, even, would cease to produce; that other grasses would take its place, though in the course of a few years the blue grass-would be produced again. The reason of this, as I have often seen with other grasses, and especially with white clover, is, a very dry season or series of them being unfavorable to growth, the grass is choked, and other varieties, already there in connection with it, take its place. A moist season returning (and blue-grass is a moisture-loving plant), the blue-grass quickly spreads by its roots, and soon again covers the ground. Hence we see the necessity of a variety of grasses in a pasture, and the same rule will hold good in meadows.

Another reason why a variety of grasses should be sown in meadows, as well as in pasutres, is that a greater burthen may be grown than with few. But in meadows, unlike permanent pastures, the varieties sown should ripen nearly together.

Timothy and clover fulfill these conditions only tolerably; clover and orchard grass more nearly. With these, or nearly so, will be found purple, smooth and sheep's fescue, Downey oat-grass, tall oat-grass, rough meadow grass and Kentucky blue-grass. Ripening with or nearly with timothy will be found tall fescue, fertile meadow grass, yellow oat-grass, meadow barley-grass and soft meadow grass. Red-top ripens later, but all the valuable *Agrostis* may be here included as ripening with or soon after timothy; but, unfortunately, the red-top family are mostly moist meadow and pasture grasses.

Many of those we have named have not been much tried in the United States, so that at last we must come back for meadow grasses to timothy, orchard grass, meadow foxtail, rye grass and clover for our drier meadow lands; and for the moister ones, to red-top in its varieties—fowl meadow grass, alsike clover, meadow foxtail, florin and meadow fesene.

In the United States, and especially in the West, one great mistake—and it is more general than is usually supposed by those who have learned the value of thick seeding—is that the seeding is too light. Another mistake and a more serious one—and this one almost unheeded by all—is the failure to put the land in proper condition for the seed. All grass seed is small; the most of them very minute. A large number of varieties are also quite light and chaffy. They are, for all these reasons, high in price. Yet fully one-half the farmers give their soil no better preparation when it is to be seeded to grass than for any coarse crop.

Is it strange that there is so much difference in the opinions of farmers as to the difficulty in getting a "catch of grass?" Do we not know that the germination of grass seed is by a majority of farmers considered more as a matter of luck than as a matter of certainty? Just as though there was anything in luck or chance! Given good seed and the proper conditions of soil, and the seed is sure to grow.

The proper condition for the soil to be in is one of disintegration and friability. Such a soil will be in perfect contact with the seed, however small; will contain and hold moisture without being wet, and will not be alternately highly heated and suddenly cooled. Hence, in such a soil, if grass seed is covered not more than half an inch (one-quarter is better), it will germinate promptly and grow vigorously whenever the season is sufficiently cool, from early autumn to winter, and from early spring until summer. Sown in the autumn, it must take its chances of being winter-killed the first season; sown early in the spring, it will usually get strength to resist the heat of summer, and by the succeeding autumn it will have attained root enough to successfully resist the winter. The difference between putting the soil in first-rate condition and ill condition is so little that the intelligent cultivator will easily see the necessity of so doing. It will pay with any crop, and with no crop better than for grass.

The best condition for the growth of grass is a soil firm, well disintegrated as a whole, but with a smooth and fine surface tilth. This condition also answers for the cereal grains, with which grass is usually sown. Winter wheat is the best crop with which to sow grass seed, spring wheat next, and oats the worst of all.

The chief disability of oats is that it so completely covers the soil and ripens so late that grass grows weak, and when given to the full light, after harvest, it is apt to be killed by the drought and heat. Hence, if grass must be seeded with oats, not more than one and a half bushels of the grain should be sown per acre. It is better to sacrifice a portion of the grain crop for the good of the grass. In fact many excellent farmers prefer to seed their meadows without other crop, and if seed enough is given—thirty or forty pounds per acre—the probability is that a good crop of hay may be taken in the August following. We have taken over two tons of timothy and clover thus sown, and the autumn found the field covered with a thick, smooth, compact sod. In fact, one of the greatest mistakes in the seeding of meadows is that too little seed is used. Hence before a uniform sward is reached, seed of ripened grass must have resodded the bare surfaces.

To insure a perfect tilth for grass seed, we know no better plan than to plow the soil in the autumn, leaving the surface rough for the winter. In the spring, whenever the land is so dry as to be quite friable, harrow it roughly, put on a leveler to bring the soil as smooth as possible, harrow again, sow the seed and cover it with a harrow turned upside down, or else with the teeth so filled with brush that they can only enter the ground slightly.

A better way is to cover with a smoother, a wide plank or series of planks lapped one on the other, and eight feet more, to which the team is so hitched that the forward [illegible] carried above the surface, the laps being so arranged that they will not catch the earth, but slip over it. Thus the soil is both ground as to the lumps, and the seed is duly pressed into the soil, the surface being left in much better condition than it can possibly be with a roller.

The earlier in the spring the soil can be put in proper condition the better, but in no case must it be touched until it does come into condition. When this takes place perfectly let nothing interfere with seeding, however early it may be.

If sown on spring wheat, drill the wheat first, then sow the grass seed and plank it in. The same rule will apply to seeding with fall wheat. Any of the grass seeds may be sown in the fall, but we prefer sowing early in the spring. Clover should always be so sown, since except on sandy lands it is almost sure to be heaved out if sown in the fall.

We do not favor permanent meadows. As a rule the first three hay crops will be the best taken from a field. After that the land may be pastured, if it retains a good sward. If, however, it gets bare in spots, it is better to turn it over, crop it, and at the proper time reseed. So no field intended for hay should be grazed in the spring. How closely it may he grazed in the late summer and autumn must depend upon the judgment of the owner. It must be apparent that no meadow in which timothy forms an important part should he grazed by horses or sheep. They bite too close, in fact, into the bulbs of the timothy, which lie just at or above the surface of the soil.—*Breeder's Gazette.*

Starting a Pure-Bred Herd or Flock.

As we have often stated, the cheapest and quickest way in which a farmer of limited means can secure a supply of improved stock is to persistently use well-bred males on the best females of common cross-bred stock he can afford to purchase. The cost of a herd or flock of the more popular breeds is so much that the average farmer cannot afford to purchase such. It is fortunate that high grades—animals of seven-eighths or more "blood"—are often nearly or quite as good for all practical purposes as those technically pure bred. This being true, there is little room for arguing that a farmer may not secure good stock. The use of well-bred males for a few years will give him good stock, if he use good judgment in selection and give his stock good care.

But a herd or flock of pure-bred animals may be built up much sooner than is usually thought, given only a very small foundation. Of course there is an element of uncertainty in all breeding. A mare, a cow, ewe, or sow may fail to breed, or may persistently produce male offspring; but, with the average results, the progeny of even one female will soon become a large number. Surely, there is no good reason why a farmer may not have a herd of pure-bred hogs if he wish. Let him purchase a sow in pig now, and by the autumn of 1884 he may have as many young brood sows as most farmers care for. In five years the progeny of one ewe may become a good-sized flock.

With larger animals the rate of increase is slower; but from a cow in calf, purchased this spring, there may readily grow a herd of twenty females, old and young, in ten years. A good brood mare, in like time, may he the ancestor of at least all the horse stock needed on the average-sized farm.

This is not "mere theory." There are now large herds of fine stock entirely descended from one, two or three cows purchased not many years ago. Probably many readers may recall cases where a brood-mare belonging to a neighboring farmer "has made him as much money as all the rest of his farming," to quote a saying we have frequently heard.

To a young man ten or fifteen years seems a long time, and many of them neglect efforts to improve their stock because the process seems a slow one. We are laboring to hasten the time when "improved stock" shall be "common." The number of farmers who see that it pays them to use nothing but well-bred males is rapidly increasing. A large percentage of this number can well afford and would find it to their profit to also purchase at least a few well-bred females.

The successful fine stock breeders need not fear that such advice is calculated to destroy their business. There will always he room for choice in the best-bred stock. The skillful breeder will always find a demand for his superior animals; quite probably a better rather than a worse demand on account of the large number of farmers engaged in breeding "pure-bred" stock.—*Breeder's Gazette.*

By raising the temperature of cream high, white butter is the result. In summer the temperature is apt to be thus, especially in dog days, and hence there is white, frothy butter and less of it, and it takes longer to bring; so in winter, with hot water, butter is scalded, as it is called, all in temperature. This, when high, causes the sugar to ferment and produce acid—lactic—and the acid acting upon the salt liberates the casein or cheese principle, which then curdles and a white mass of cheese and butter is made—much of the butter remaining in the milk, while the butter has an undue quantity of cheese. The remedy is, take care of the temperature, not only in the churn, but the milk and cream before they get there. There will then he absolutely no difficulty. Fifty-five or sixty degrees is the point to aim at from the time the milk leaves the cow till the butter has come.

The United States have been creditably represented in the annual Christmas cattle markets of London for the last six years, and the present year is no exception. On the 29th ult. the steamer Greece of the National Line took out a noteworthy cargo of live cattle, and on the following day the steamer Stronaus sailed with upward of 300 fine steers. The cargo of the Greece was made up partly of premium steers at the late Chicago fat stock show. There were eighty three-year-olds whose average weight in this city was 1,950 pounds, and there were also eighty-one steers two years old averaging 1,660 pounds. A New York telegram says that as a whole this shipment of beef cattle was probably never before matched for quality, unless by a lot of 130 head sent to England about three years ago.

If the horn of a buck or other animal is found to be growing in a way not desired, it may be changed by scraping with a knife on the side to which it is wished to turn its growth. The scraping dries and hardens the horn, while on the opposite side growth continues without interruption.

Shorthorn Form and Value.

I don't think that I have ever seen Mr. Thornton better pleased, or in higher spirits, than he was at the recent Shorthorn sales of Lord Beauchamp and Mr. Homfray; and the reason was that he found his idea of cattle—intrinsically good in themselves, and not merely dependent for their value upon a long line of ancestry—making considerably over butchers' market price. It is what he has always gone for, and he is right. People have, of late years; run so madly after pedigree only, that some tribes, through their owners' anxiety to "keep them pure," have declined into absolute unhealthy wastrels. A reaction has consequently taken place, affecting the price even of the sound and strong. On the other hand, there are a large number of people who can not be persuaded of the undeniable superiority, for crossing purposes, of the "blue blood," but who are prepared to give for a shapely sort, bearing evidence of both milk and meat, sums of money considerably over ordinary trade value. They estimate them, when they have got them home, possibly as high, and find as much pleasure in their contemplation, on the pasture and in fold-yard, as does the owner of the rarest sorts his coveted possession. But when they come to sell again, they find ont their error in the fewness and backward spirit of the auction attendance. Such investments, in their day and turn, had Lord Beauchamp and Mr. Homfray made, and the executors of the last at least, were surprised that no more was made for them than was predicted by the *cognoscenti*, to a pound. The same story, with most certainly the same result in the future, is beginning with other native breeds—the Polled Scotch, the black Welsh, the Alderney, Ayrshire, etc. Whether this division of tastes affects all sorts, in preventing excess of competition for the one or not, any how it is very satisfactory to find pains being taken to rule out distinctively the various breeds within fixed lines of purity and value. How infinitely more satisfactory it is now to enter the show yards and view the various classes of beasts and fowl in studiously-distinct type, instead of the mongrel medley which exhibitors began with, but a few years ago. Railways have done much to bring about this change. What the limit of their improvement will be, it is impossible to predict. The end must be attained some time, although the opening of such countries as Japan may yet introduce new arts and elements of stock improvement.

But to return: Lord Beauchamp's cattle were of a grand sort, being bred a good deal with a view to winning prizes at the annual Birmingham show; where also had been selected for the most part, the sires wanted from time to time, and that mainly from the prize winners, without regard to their paper breeding. Amongst the herd sold, however, were a large number of females of R. Colling's Red Rose family at base. This lot I was especially anxious to see, and ascertain how far promiscuous crossing, on the old approved stock, had tended to influence and alter its type. The external dissimilarity of the various cattle was very striking. A red bull calf of the tribe was particularly good, and provoked strong competition, going ultimately to a gentleman who breeds eminently for milk. It showed remarkably the failing of R. Colling's original Red Rose stock, in a tendency to "high tail," and a certain slackness of build between rib and hip. The touch of deep-meat covering on hip point, so ever indicative of fattening aptitude, was also an old characteristic of the mellow tribe. The cows again were very diverse, and some ungainly enough. Either the crossing was crude or inapt. The older the animals, and so the nearer to the original sort, the more taking they were to the eye. I am, as your readers will be aware, a stickler for "old foundations." I believe in the power of the spring to throw off the scum which may have accumulated on the surface, but in the case of these cattle it would have required much faith to undertake the experiment. They sold well, however, and went into the hands of men who certainly may be expected to do their best for them. We may know more of the issue in the future. I attended the sale with the express purpose of seeing them, and positively ventured a bid or two for some lots, which at last a friend took, so that I shall, at least, see some day the value of my theory as to the strength of early blood. Mr. Homfray's sale was again a remarkable one. His father was a singularly good judge of the points of any animal, but, until lately, quite an infidel as to the superior qualities of the thoroughbred cow, at least. Gradually the fit grew on him though. Subtly the poison insinuated itself, as it ever will with those who tamper with it, into his inner soul, and he came to bid the tremendous sum, as he once thought it, of seventy or eighty guineas for a cow that pleased him by her lines, and was, moreover, red in color. This last was a *sine qua non*. Red he would have them from first to last.

He had consequently a miscellaneous collection, for he would anywhere buy the sort that suited his eye. Pity that, being very wealthy, he did not go at once for a higher flight. It would have made a vast difference in the competition at his son's sale. Of this, probably, he never thought; for the overflow of the herd always went to the butcher, and it was only the death of the owner that brought about the final dispersion. "About ten pounds apiece over the market value," was what they made, and this, of course, pays when the outlay has not been great. It is the calves with the gold upon their heads, and the yearlings, that run up a satisfactory total. But the oldest cow, first upon the list, having a capital frame and udder, bred by Rev. W. Holt Beever, was run up and secured by a veteran white-haired Welsh farmer, once devoted to the Glamorgan breed of cattle, but who persisted in his object this day owing to his success in breeding steers by a bull of kindred strain, purchased so long ago as 1864. Thus it is that conviction ultimately works its way into the heart of the most bigoted, and good sorts maintain their way. Of what real beauty is, in the case of cattle carefully bred on the strictest lines from old fashionable strains, I had ocular demonstration last week, in a couple of youngsters bought for service in the herd, numbering a hundred head, part of which will come to the hammer next spring, of Mr. Robert Blezard, a rich and very spirited buyer upon occasion at several of the fashionable sales. The one bull was a Wild Eyes, got by a Barrington sire, out of Lady Wild Eyes 7th, for whom Mr. Blezard gave 555 guineas, at the Berkeley Castle sale in 1876. This youngster is very short-legged and massive, especially about the rounds and quarters, yet touches most mellow all over. The other is a cherry Grand Duke, bred by Capt. Oliver, broad-backed, stylish, and carrying himself "like a gentleman," as Culshaw used to express himself in the palmy days of Towneley. How infinitely more safe to use such sires than the handsomest mongrel that ever was raised.—*Colonus, in Live Stock Journal.*

A hog sweats not like a horse or man but through a place in the skin of his fore legs, just below the knee, in the form of a sieve. Through this the sweat passes off, and it is necessary that this be kept open. If it gets closed, as is sometimes the case, the hog will get sick. To cure him, simply open the pores. This is done by rubbing and washing with warm water. There is not much danger, however, of a healthy hog ever being troubled in this way. Once in a while it will occur in the best regulated hog pens.

FISH.

The Black Fly.

Do you know the black fly of the woods? Here it might be a point of etiquette to await a reply before saying more, hut this will take weeks, and then bring in a variety of answers, mostly "yes," or "no," the variety being in the different ink used, so I will ask another question. Do you know all about him, her, or them? If you do, then tell me, so that I may also kuow; but, on the supposition that some one has answered my first question by asking "what are black flies?" I will proceed to tell him a few things that I have noticed about them, and a few theories that I have formed concerning them. These may be all wrong, and if so, the sooner they are discarded the better, and a new set framed that are warranted to stand the strain.

Are you listening? You man who don't know what a black fly is, I meau; for if yon don't know, and don't care to, then this ink might as well be saved. Now, here goes for it. A black fly is a small sort of thing, not bigger than two small pin-heads placed one behind the other. He, she, or it, has six legs and two or more wings; am not so sure about the number of wings, bnt yon'll find the legs all right. What particnlar Greek or Latin cognomens the bug sharps have seen fit to adorn him with is more than I know; but if these names do not translate into English to mean something with a chronic hunger for a fisherman's blood, then is science a delusion and a snare. When it is added that the legs of this fly are sometimes speckled, aud that the guides can tell by the spots how long they are likely to remain, then all the knowledge the guides have of them, and a little more beside, is given. Did you ask why such an insignificant being should play the leading character in the drama of wood-life, that it should become the leading question when to go to the woods? If you do ask this, then there is but one answer. It is not that the fly of himself is so pestilent, but because he makes himself so numerons. The mosquito may also become numerons, but his nnmeronsness is as naught to the multitudinons black fly. Swarms is the only word that gives one an idea of the numbers of the fly, and when you add that no amount of fighting or thrashing aronnd disturbs the flock in the least, each individual of which is as brave as a goat—which is my beau ideal of a courageous animal—then you get a fair idea of the little pest. A net is merely a hive for them to get nnder and to keep them from getting out, and the only protection is in some of those compounds of oil, tar, or other substauces, which are smeared on the face and hands. Even these do not prevent the insects from flyiug against your face and tickling it in a manner almost as bad as their bite; nor does it prevent an occasional one from exploring the region covered hy clothiug, and an itching, inflamed spot tells where one has penetrated to a region supposed to be perfectly protected. During the season of them the ouly time that they are quiet is during the night, or while a breeze is hlowing.

Why does this fly exist? That is what I tried to find ont. All thiugs have their nses in the economy of nature, and if you heard one black fly ask another why yon existed, the answer might be, "to feed the black fly." But this fly undoubtedly plays a more important part in life than taking an infinitessimal portion of blood from a man, a dog, a deer, or a panther, and leaving a smaller portion of poison in its place, which, while not worth as much to you as the hlood, is, without doubt, poison of the first quality, and might be nseful in materia medica if experimented with. While we know that it is only the female mosquito which carols her exquisite little song and takes the blood from your sleeping nose while her liege lord goes hungry for ever, I do not remember to have heard whether the husband of the black fly has an inclination to lunch at the same table with his partner, assuming that she bites also, or not. In fact you will have perceived before this that I do not know a great deal about the insect which we are discnssing together, but having told yon all that I think I know positively, we will go on to the theory of the benefits which accrue to mankind from the aforesaid little black fly.

The trout are thickest where the fly is most numerous, and yet few or no flies of the kind we are talking about are found in the stomachs of the trout. The further north we go, even into the Arctic circle, the more of both trout and black flies do the waters prodnce; and when the wild lands are cleared, both the trout and the black fly either disappear together, or the fly goes first and the trout lingers in dimiuished numbers. The food of the infant tront is gone. The little worm-like larva of the fly is the best possible food for a troutlet, and where the black fly abonnds, the waters dnring the fall, winter and spring, swarm with their larva. This insures life to the young fish during the first three months of its existence, when they die by thousands npon the least provocation.

Large insects, with their correspondingly large larva, are well enough for adnlt trout, but are of little nse to a fish that is smaller than they; and a trontling of an inch long has no nse for the grown larva of the May-fly. There are other small flies whose lives are partly passed in the water in the form of worms, such as the gnats, midges, etc., and, of course, these furnish more or less food for the baby trout as well as the black fly does, but when we add the millions of hlack fly larva to these, then the waters are rich in food. With the clearing of the original forest, the black fly leaves, and does not seem to return with its second growth, as we do not find it nnder such conditions except where this second growth is surrounded by primeval forest. The fly flourishes where lakes have been raised above their original level and a tract of marsh or woodland has been submerged, giving much forage of decaying vegetation as food for the fly larvæ.

There is one thing, however, which no one has attempted to explain. This is why the black fly appears in the spring and is usnally gone by the first half of July in the Adirondacks, while in Maine it stays all summer. Who knows?—*Fred Mather.*

An Ineffective Fish Way.—The Fresno *Expositor* complains on account of the dam thrown across the San Joaquin river, six miles above Firebaughs, by the San Joaqnin and Kings River Channel Company, the salmon and other fish that in times gone by fairly made the water of the upper San Joaqnin ripple with life, have been nearly exterminated in the river above the dam. The company claims that it has complied with the letter of the law in regard to fish ways, but it is evident that it has not fulfilled its spirit, or else the complaints would not be made. It seems that unless the water in the river is high enongh to go over the dam, the fish cannot ascend the water-way that is ostensibly prepared for that purpose. Perhaps a visit from one of the State Fish Commissioners might produce a change for the better in this regard. Something must be done that the people of Fresno may have their share of the bounties of the waters that were once, and which now ought to be, fairly alive with the finny tribe.

Florida White Sharks—A Big Jew Fish.

Cruising around the peninsula of Florida last winter, the middle of February found our schooner Rambler moored to the warf of Jupiter light, about a mile from Jupiter inlet. The lighthouse tower, a fine brick structure of a hundred feet in height, stands on a bluff some fifty feet above the water, at the confluence of Locohatchee and Indian rivers. The locality is well known to Northern tonrists as one of great beauty, and is quite celebrated for its fine fishing. Indeed, the fishing is excellent, so far as quality and variety of fishes are concerned, and is not snrpassed in this respect by any place on the east coast.

By trolling in the channels with squid, spoon, or even a bit of white rag affixed to the hook, the member of the hand-line committee can take crevalle, blue fish, sea trout, bone fish, snooks, etc., to his heart's content; while the rodster, with either fly or mullet bait, can be eqnally successful in taking red fish, grouper, gray snapper, mangrove snapper or small tarpum under the mangroves; or with fiddler bait, near the oyster beds, he can get his surfeit of sheepshead, porgies, grunts, toad fish, puffers, etc., etc.

It was a lovely star-lit night that, after a supper of hoiled pompano and raw oysters, I filled my pipe and reclined on the roof of the cabin, my back against the mainmast, to enjoy a brief season of rest, and to take my *otium cum dignitate* after a day's fishing and hunting. The stars peeped out and twinkled over the sea, from whence came the low moaning of the surf on the beach, and the loud roar of the breakers on the bar. The night was singularly still and beautiful; the only sound of animated nature to be heard was the vociferons call of the chnck-will's widow across the river. The revolving light at the snmmit of the town sent out, at intervals, a long ray of light like the tail of a comet, which flashed and gleamed over the phosphorescent waters.

The boys in the cabin were getting ready their shark tackle—300 feet of half-inch Manilla rope, with immense shark-hook, swivel, and two feet of small chain. Shark lishing was their nsual sport at night. My qniet was broken, for the boys were on deck.

"Now for the shark!" exclaimed the "'Squire," as he baited the hook with a three-pound red fish, stepped into the dingey and rowed out some hundred yards into the stream, "Jack" paying ont the meanwhile.

The oars struck drops of fire from the still surface, while a pathway of light was seen astern of the little boat as it rapidly moved along. Throwing over the baited hook, 'Sqnire soon returned, saying:

"The tide has jnst turned, and there will be sharks galore on the young flood."

It was but a few minntes ere Jack sang out:

"I've got one now!"

"Let him run a while!" said 'Squire. "Now yank him!"

Jack accordingly "yanked" him and then the tronble began. The line fairly whizzed as it ran out, its course being plainly marked by a long thread of phosphorescent fire, as it cut through the water. 'Sqnire had taken a turn of the line around the rudder-post and snubbed his sharkship, who instantly rolled out on the surface with a great flouncing and splashing, seeming to lash the water into flames with its great tail. But he was soon off on another tack when more line was given him. The 'Squire now took hold with Jack and they proceeded to "play" the immense fish.

"How he pulls!—See him go!—He's headed for the Bahamas!—Hold hard 'Squire!—Hang to him Jack! Now he's laying his course for the Everglades!—Here he comes; haul in the slack!" Such were some of the exclamations of the "Skipper" and myself, as Jack and 'Sqnire were tugging for dear life.

They soon had him alongside, however, when the skipper brought out a rifle and sent a bullet crashing throngh its skull. It was then hove on deck, and rolled out on the wharf.

It was not long nntil there were three hnge white sharks, from ten to twelve feet in length, ranged side by side on the wharf. Jack had been out again with a newly baited hook, which he carried out some hnndred and fifty yards, and was waiting for another "bite." Suddenly there was a loud "swish," as the line was jerked through his hands, and poor Jack was dimly seen in the darkness, dancing and capering around on the deck, wringing, rubbing and blowing upon his fingers, while the line went rattling overboard at a fearful rate. 'Squire seized a slack coil of the line and took a turn around the rudder-head. Soon there was a violent jerk that made the little schooner tremble from stem to stern, as the strain came suddenly on the rudder-post.

"Oh, he's a daisy!" sung ont 'Squire, with some excitement.

"Yon bet he is; he's taken all the skin off my hands," answered Jack, lugubriously.

"Lend ns a hand, Skipper, he's a whale!"

So the Skipper, 'Squire and Jack had their hands full for the next fifteen minutes. There had been nothing like it in all their previons experience of shark fishing. The surges and struggles of the fish were tremendous. Once he jumped clear out of the water, and fell back with a noise that was really frightful, while his outlines were dimly portrayed on the luminous surface.

"That's no shark," said the skipper; "it's a grampus!"

"We don't want any grampuses; let's ent the line," said Jack, with some trepidation.

"I'm bound to see what he is, anyhow; and will haul him out on this line if it takes till next summer!" resolutely replied the 'Squire.

But there is an end to all things, so in due time they had him alongside, and with a rifle ball through his brain the monster was quiet enough.

"He's as big round as a barrel," said the Skipper, as he slipped a noose around its body.

The boys soon had him on the wharf with the sharks. It proved to be an immense jew-fish, or hlack grouper, and reminded one at the first glance of a gigantic black hass. It measured aeven feet in length, and six and a half feet in girth at the pectoral fin. The spines of the dorsal fin were as long and thick as a man's fingers. The next morning Mr. Armour, the chief keeper of the lighthouse, brought down a large steel-yard, npon which it weighed three hundred and forty ponnds. Its huge proportions were then photographed by the assistant light-keeper, Mr. Spencer, with the deck and crew of the Rambler in the background.

Two months later we caught another one at Littlo Gnaparilla inlet, on the Gulf coast, nearly as large. It weighed, perhaps, three hundred pounds.—*Cor. Angler.*

New York State is the fourth in the list of fish-producing States, and the products are worth $4,380,565. Her oyster fisheries represent alone $1,577,050. She employs 7,266 persons, has 541 boats, with a capital of $1,659,585, and her total prodnct was worth $4,380,565.

The Salmon Canning Industry.

Total pack for the season of 1882, in round numbers, 535,000 cases.

An average price to cannery, say, $1 30 per doz. each case containing four dozen one-pound tins, $5 20 per case, $2,782,000.

To this should also he added the value of barreled salmon to show the actnal output of the thirty-six canneries located on the Columhia river.

The individual shipments direct from Astoria to foreign ports show a total of 344,328 cases, or more than double the shipments made to San Francisco for reshipment to Australia, the Eastern States and the islands of the Pacific ocean.

The capital invested in canneries and appliances is estimated at $2,000,000, and employment is given during the fishing season to over 7,000 men. Large quantities of tin plato are imported from England direct to the Columbia river, the canning industry having introduced our direct import trade with England by the large quantities of tin, sheet iron and chemicals required. Duty on tin plates, less ten per cent., is refnuded to canners ou their making proper entry at the custom honse at the time of making foreign shipment.

The continued run of salmon in the Columbia river is remarkable, considering our lax laws, and the destruction of fish by traps and wheels, which should he abolished by law. The law against fishing from Saturday nntil Monday should be strictly enforced to allow the fish to ascend to their spawning grounds, and a hatchery shonld immediately be established, either by the nnited action of the canneries, or the State. When one considers that with the very best appliances to take fish, our canneries have, year after year, packed from 400,000 to 500,000 cases depending simply on the fish that escape to their natural spawning grounds, it can easily be seen what a future awaits this industry when a hatchery has been established able to turn out millions of fish annually. It is safe to say that instead of 500,000 cases, one or two millions might be packed for the markets of the world; but even taking the lower figure, 1,000,000 cases at $5 to the canner, it shows $5,000,000 flowing into our State from this one indnstry, to say nothing of the shipping brought to onr river. A million cases of salmon would load over thirty ships of 1,000 tons carrying capacity. Each of these ships' disbursments n our State would reach a large snm; therefore, we should, in looking at the matter of a hatchery, look farther, and ask what the effect wonld be on Oregon's commerce in the futnre. Certainly the above remarks answer the question.—*North Pacific Rural Spirit.*

An Obstruction.—The dam in the Truckee, some five miles above its mouth, prevents fish from ascending the river, and they are now gathered in immense nnmbers below it, seeking a way up stream. A canal rnns round the dam, intended to afford passage for fish, but it is choked with ice, in fact frozen solid, so that they cannot pass, and no effort is made to open it. The result is that mauy female tront are losing their spawn and small fish being killed hy the larger ones in their efforts to get up stream to the spawning ground in the Trnckee. The dam has recently been put in by the Indian agent, to back np water for irrigation, and is therefore an experiment. It was thonght the canal would afford sufficient means of passage for the fish, and so it would, perhaps, if it could be kept clear. Just at this season tront want to go up river. They travel slowly, and would probably be two months going from the mouth of the river to Verdi. To keep the fish out of the river at this time will cause an immense depletion in their nnmber next year, and if followed up for a few years would render them nearly extinct, as they do not breed in the lake. There is a large draft made upon them, from 1,000 to 2,000 pounds being shipped daily. It is hoped that the agent at the reservation will notice the obstruction and remedy it, if possible. Fish ladders are out of the question at the present time, as they would become choked with ice at the top, and thus bar passage. The only remedy seems to be to keep the canal open, which may perhaps be a difficult matter.—*Reno Gazette.*

A qneer fish (?) was recently caught in the harbor of Honolnln. It is thus described by the *Saturday Press*, one of the local papers: "One of the missing links has been discovered. A queer 'beast' was caught in the harbor the other day and given to Mr. B. F. Dilliugham, who has had it preserved in alcohol. It is about five inches long and is shaped much like a fish. It has a flexible fin on the back and a smaller one just back of the head which is shaped much like that of a catfish. A soft horn protrndes from the base of the head, and hetween the eyes is a single short feeler. It has no gills and breathes like a frog. On each side, back of the head, is a short flipper like a seal's, and farther back are others having a joint, giving them the appearance of a kind of hind leg, and yet they resemble a fin somewhat. The tail is like that of any fish. The belly is an immense soft pouch as large as the remainder of the animal. It is jet black all over, has no scales, aud apparently is formed for either swimming or crawling in the mud. What is it?"

A gentleman in Honolulu is talking of procuring carp from California to introduce into island waters. We understand that the experiment has been tried on a small scale at Kukuihaele, Hawaii, with success.

The Sultana Grapes.—L. J. Rose, of San Gabriel Valley, in discussing the various varieties of grapes refers to the Sultana in the following manner: Perhaps the most valuable of all grapes is the Sultana, for it can be used for both wine and raisins. It makes the highest priced raisins; it will dry in half the time that it takes the Muscat of Alexandra, making it possible to make raisins in any locality which may now be too cold or moist for ordinary raisin drying. It makes, it ia said by those who should know, an excellent wine, and is believed hy experts to be the Sherry wine grape of the State. It will make good brandy. It has no offal in the way of seed, which may be reckoned at least ten per cent. advantage, for the seed will weigh that much in ordinary grapes. There being no seed in the Sultana works too as a great gain in another direction to the producer, for it is a well-known fact that nature expends more of its force and substance, that is it requires more plant food for developing its seed for reproducing its kind, than in any other effort. There being no seed to make, all this plant food and force will be expended in the making the useful part of the grape, its juice, and in consequence it can and does produce more grapes to the acre than perhaps any other grape.

The Royal Hawaiian Agricultural Society, recently organized, has among its principal objects the saving and extending of Hawaiian forests and the encouragement of improvement in the breeding of cattle and horses in the islands. The society has quite a membership already and received an appropriation of $5,000 from the last Legislature. It is proposed to hold the first annual fair in Octo[illegible].

Mr. M. J. Henley is a duly authorized traveling agent and correspondent for the "Breeder and Sportsman."

TIPS WILL ANSWER.

In the last number of the *Turf, Field and Farm* appeared the article which is given below. One of the points made is that we have trotted Antevolo barefooted, and a question is asked, the reply to which we take for the "head" of this article. In the case of Antevolo it was determined to see what could be done with an entirely natural foot, and for another reason which will be fully explained in a history that will soon appear, and in that the whole case will be presented. Staunch as our faith is in the use of tips in comparison with the whole shoe we are free to admit that it would be better if the feet could go without any metallic protection, and if there had been soft roads to work upon during the winter the experiment would have been prolonged. But when the rains came a great part of the work had to be done on the macadamized roads, and when these are wet they wear the horn away very rapidly. This entails "protection" when the chief wear comes, and two weeks ago tips of three ounces each were put on him for the first time. As he was doing reasonably well barefooted there was no urgent necessity for the application of tips, although we felt quite positive that his speed would be increased. It is too long a story to relate now, and so it will he passed for future exemplificatiou.

In our seven years' experience with tips there has been less soreness of feet and legs than ever before, in fact there has been no indication of soreness in the feet at all. Never a particle of abnormal heat, no inequality in the growth of the horn, and neither bruise, discoloration or sign of corns.

From this experience we are led to believe that the trainer of Algath was mistaken in ascribing even a "little soreness" to the use of tips, and that it arose from some other cause.

We are well aware that tips are of ancient origin, but we claim "novelty" in the manner of setting them, and this change from ancient practices obviates the troubles that come from faulty application. By cutting a square shoulder for the posterior part of the tip to rest against the proper bearing is retained, as the foot is given a natural position, and the weight of the body sustained without undue strain on the tendons. Until we inaugurated that method of setting there were grave difficulties in the way, and which, in our estimation, are obviated.

In the same number of the *Turf, Field and Farm*, in an article, "The Americans in England," is the following: "English critics think the feet of Foxhall too small for his body. They should have been expanded by some one who knew how to do that work without producing tenderness or soreness."

Any mechanical expansion—which is, doubtless, the meaning—in ninety-five cases in a hundred will work serious injury. Anyone who will give a little study to the mechanism of the foot will he convinced of this unless his judgment has been warped by wrong teachings. The only thing is to aid nature in her efforts to remedy existing evils, and that aid must lie in another direction than the use of screws and levers. One of the main apostles of coercive expansion claimed that the frog was only intended for a cushion for the tendon that passes under the navicular bone to rest upon, and that it must be raised above the ground as a hammock is swung between two trees.

To believers in this dogma we do not expect to favor the use of tips. Those, however, who have faith that the "good mother" rarely makes a mistake, and that the frog, bars and commissures were designed for a purpose, will see the propriety of giving them a chance to perform the labor assigned:

Mr. Simpson, of the California BREEDER AND SPORTSMAN, advocates the use of tips. In copying our article on Algath, in which we referred to the fact that she wore tips when she trotted at Chicago, he says:

"On this side of the continent trainers who have seen tips tried are willing to admit that they are an advantage to the feet and legs, but they claim that they are a drawback to trotting speed."

We, too, claim that they are a drawback to trotting speed, inasmuch as they tend to "sore" every horse that wears them unless the animal has a diseased or malformed hoof. The trainer of Algath admitted to us that they made her a little sore, and on that account he took them off and put on ordinary shoes.

Tips were tried and abandoned in England a hundred years ago. Joseph Goodwin, Veterinary Surgeon to George the Fourth, a member of the Royal College of Surgeons, in his admirable work on shoeing, published in 1820, says, in a note on page 305:

"The author omitted in the chapter on grass shoes or tips, page 210, to mention that an attempt was made to bring them into general use for road-work and other purposes, but, as they were found not to answer, the practice was soon discontinued."

Mr. Simpson himself, in another article, in the number of his paper from which we have quoted, says, in speaking of Antevolo, his own colt:

"In the Embryo Stake for yearlings Antevolo, by Electioneer, was second to Dawn, by Nutwood. The winner made 2:59, the fastest time ever made by a yearling in an actual race, and the fastest record for a stallion colt. Antevolo is a late colt, having been foaled the 12th of May, and he was trotted barefooted. He was timed as the second horse in 3:02, which for a colt with only a little work and without shoes, tips, weights or boots, cannot be called a bad showing. Since the date of the Embryo, and still barefooted, he has shown quarters at a "fifty gait," and a half mile in 1:28."

From this it will be seen that notwithstanding his advocacy of tips, Mr. Simpson trotted his own colt on at least two occasions "barefooted" and "without shoes, tips or weights." Has he, too, found that tips "would not answer?" If not, why did he not use them on the occasions referred to?

DEATH OF DUCHESS OF NORFOLK.

On Monday morning last, at Agricultural Park, Sacramento, the Duchess of Norfolk died from lockjaw, induced by an injury received when running in a small lot. She ran against a 2x3 scantling that penetrated the muscles some six inches above the stifle, rupturing the flesh fearfully, but it was hoped that as the injury was confined to the muscular tissues she would recover. When tetanus attacked her there was little hope, as there are few instances on record of recovery when it arose from a wound. The loss is a severe one to Mr. Winters, not so much from a money point of view, as there was a value placed on her beyond a question of dollars. That she was a great racehorse is beyond cavil. In our estimation, she was one of the very highest class, and Mr. Winters being well aware of how good she was, was doubly anxious that she should retrieve the defeats she met when in such poor condition that she was scarcely a shadow of her real form. The day she won the Pacific Cup we doubt if there was a horse in the United States that could have beaten her that distance. She was not only as fast as the speediest, but she was also stout and strong of heart, and with everything favorable there is scarcely a question that she could run from one mile to four in as fast time as there is on record. This, of course, can only be given as an opinion without a chance for verification.

The loss of the Duchess will probably change Mr. Winters' plans for making an Eastern tour this season. The two-year-olds, Prince of Norfolk and Callie Smart, are the only ones in his stable that could be sent, and the long and expensive trip will hardly justify relying on those of that age, however good. No matter how great a racehorse the Prince of Norfolk may prove to be, the loss of his sister leaves a gap which cannot be filled by a colt. She was as great a favorite with the family, greater even than with her owner, and we have no doubt that there were sad hearts and tearful eyes when the intelligence came of her death.

Mr. Winters has had a constant succession of ill-fortune in his racing stable for years, the best being invariably the ones which were fated. Ralston, Flood, Duke of Norfolk, Connor, a whole drove of promising colts that never "got to a race" were the victims, and a great majority of men would have given up, disheartened at the frowns of Fortune, and succumbed to such a perverse fate. He has persisted with a "gameness" which is admirable, and has been the mainstay of racing on this coast. Straightforward, honorable, untiring in his efforts to build and sustain the royal sport, he will have the sympathy of everyone who ever attended a race meeting or fair on the Pacific slope, and there will be a unanimous wish that the long lane of ill-luck has finally come to an end with this severe stroke, and that in the future there may not be a casualty befall him.

HORSES IN MOTION.

We have a series of figures copied from the instantaneous photographs of animals in motion, taken by Muybridge at Palo Alto, and which it took some three years to bring to a successful termination. Although it cost Ex-Governor Stanford a large amount of money, so much, indeed, that we do not believe there is another man in the world who would have expended a like sum for a like purpose, yet there is not a doubt but that the reward will be commensurate to the outlay. Not to the donor, however, who will receive no more advantage comparatively than the owner of a few horses, always provided that people will avail themselves of the teachings and put into practice the lessons acquired. These figures are on strips arranged for a Zoetrope, and not having one of these instruments we were forced to construct a machine that answers the purpose very well. A common sieve, twelve inches in diameter, was bought, cardboard obtained from letter envelope boxes, a piece of copper rod for the pivot to revolve it upon, a macaroni box gave the material for a bottom, and a couple of hours' work put them into shape.

We claim a decided improvement over those in the toy shops. The copper rod was attached to the center of the bottom, projecting ten inches, the end of it rounded and then a hole bored into the leg of the desk from the top to a depth of five inches. The instrument could thus be revolved with the thumb and forefinger grasping the rod, and twirling it at any desired rate of speed, whereas, in the other case, motion has to be given by striking the cylinder, or by a crank and friction wheel.

It requires rapid revolutions to give a faithful representation of a racehorse in a fast run, and with the right speed the illusion is perfect. But to study the action a slower motion gives a far better opportunity. The legs are then seen in the exact positions that are taken during the stride, and the changes from the time when the last impulse is given by the foreleg to hurl the body through the air until it takes the position again are distinct as can be. It throws additional light on the photographs, and transforms the grotesque figures into those having life and action.

On the photographic card are twelve representations of different portions of the stride; the slip in the revolving wheel gives the intermediate positions. The feet strike the ground in a measured cadence, which is very accurately represented by placing the hand on a table and bringing one finger down at a time, commencing with the little finger, and at regular intervals the others. There is a pause from the time the forefinger touches until the little one is brought down again corresponding to the bound of the horse. The photographs showed that the universally received opinion that the hind legs were the main driving power was fallacious, and that one foreleg gave the last grand impetus which sent the body fully seven feet when it was unsupported. They also taught that the first contact after the air-flight was with the hind foot, and established the position that it was the violent effort to raise the weight and send it along with the velocity a fast gallop entails, which "sprung" the tendons, and in some cases tore them from the ligaments or severed the sheathing.

The Zoetrope confirms the view and corroborates the testimony beyond impeachment. It shows the tremendous energy of the movements, if even the figures are small, and a short study of the figures in motion will convince anyone of the necessity for overcoming the strain as much as it is possible to effect. This little machine also explains why so little was known of the true action of the fast gallop before the camera disclosed it. When the wheel is made to revolve with sufficient rapidity to give a perfect representation, the feet and legs are moved so rapidly that the impression is indistinct. The bound is seen, but the legs doubled under the body are not apparent. While the body is moving at the rate of a mile in 1:40, or faster, the legs have a far swifter motion. They are performing a set of evolutions distinct from progression, and "opening and shutting" with incredible velocity.

What is called a stride in the racehorse is from where the foot leaves the ground until the same foot touches again. "Five tracks" is the guide or four spaces. This is correct, but the same system of measurement, although universally adopted, for the trotter is erroneous. The five tracks or corresponding four spaces in the trotter are virtually two strides, and the interval when the body is thrown through the air occurs in three tracks or two spaces. Thus, from where the foot of the trotter leaves the ground until it touches again there have been two air flights. The impetus, or rather the final impulse, is given with the hind leg, although deriving more assistance from the fore than the fast galloper gets from the hind, as there is a very short time between the movements of fore and hind. These two bounds in a shorter space than the stride of the racehorse explain why it was so difficult to convince many people that the fast trotter had all of his

feet off the ground during the stride. It was palpable in the racehorse, but extremely difficult for the eye to catch in the trotter, although it was patent that the ground covered in the stride was positive proof that such was the case. It can be seen when the zoetrope is made to revolve slowly, although it requires close scrutiny to detect it, though the various positions of the feet and legs are realized without any trouble.

Beside horses at their various paces there are representations of deer, greyhounds running and oxen running and trotting. There are also pictures of a horse in the various positions of a hurdle race, and all so lifelike that it is interesting to those who are not students of the action of horses. To the latter it is difficult to overrate the value of the lessons conveyed.

SPRING RACE MEETING, P. C. B. H. A.

The full programme for the spring meeting of the Pacific Coast Blood Horse Association will be found in the advertising columns, and we think that everyone having horses and colts to engage will be well pleased with the arrangemeuts. It is certainly the most comprehensive bill that has ever been offered in California, and is so varied that all ages and qualities will find a place. There is not the least question that it will attract the largest number of entries and nominations ever seen at one meeting in this country and as a natural consequence an increased attendance. It is unnecessary to repeat the stakes and purses on this page, as it is so easy to refer to the ad. Altogether there are twenty races to be decided, and very wisely the five days are fixed so as to take in three Saturdays and two Wednesdays. By this arrangement the animals engaged have plenty of time to recover from the previous runs, and the capacity is thereby increased. It virtually trebles the number of horses than if the meeting was held on consecutive days, and in the "fixed events" for two and three-year-olds there are two intervening weeks. This gives a good chance for the colts and fillies named in them to participate in those that come between. While this is a valuable concession to the owners, it is also an assurance of a better return at the gate. Not quite so convenient for those who come from a distance, though in the spring the country people are so busy that they are unable to leave their pursuits, and San Francisco, Oakland, and those places from which the trip and return can be made in one day, supply by far the largest proportion of the spectators. The city people, or at least ninety per cent. of those who attend, cannot afford to leave their business for a week at a time. All of them, however, can take Saturday afternoon and nearly all the Wednesday, too, for some recreation. By selecting the dates rather earlier than usual, the counter attractions of the picnics are avoided and this is a guarantee of several hundred dollars more than would be received when the days clash. We are also glad to see that there is a hurdle race on each of the regular days. By offering an adequate return, horses will be taught to jump, there will be plenty jockeys of ability, and with these there is scarcely any more danger than in the ordinary flat-racing. The public relish these contests and they add greatly to the interest of the meetings.

The main thing now is for the owners to respond liberally in the way of making entries, and though we have no hesitation in predicting the greatest number of starters ever known on this coast we earnestly urge every person who owns thoroughbreds to train and enter them. The distances and conditions are so varied that all will have a chance and every grade an opportunity to win something. Any questions directed to the assistant secretary, C. M. Chase, will meet with a prompt answer, and rules will be sent on application to this office free of charge.

EDITORIAL NOTES.

E. W. Piercy, manager of the Recreation grounds, objects to our report of the Haley-Masterson race last week, inasmuch as he thinks he discovers therein an inference that there was something questionable about the management. He says for himself that he had nothing whatever to do with the management, which was wholly in the hands of the Olympic Club, which we believe is in accordance with the facts, and we cheerfully give place to Mr. Piercy's disclaimer. The particular point made against the management in our report was that there was either gross ignorance or carelessness. The match was made to rule. The public were invited to pay gate money to see the race and also to bet their money on the result through the medium of pools sold on the grounds. People who paid gate money and staked their money in the match were entitled to protection in so far as a rigid adherence to rule could give it. The rule was ignored in the race and we let the cause hang between the two propositions: either the managers were ignorant of the existence of the rules or else careless in the application of them.

A Good Idea is the following editorial cut from the New York *Herald* of the 18th inst., especially that part of it that recommends a divergence from the old stereotyped "3 in 5" races. Were the race meetings limited in the same way the attractions would vanish, and in lieu of the large crowds that grace the Eastern fields the assemblages would be small It is far from being true that the modern trotter is only capable of going a mile at a time, and when trials at a longer distance have taken place the old long distance records are wiped out. Thus a California four-year-old trotted a second heat of two miles in 4:51, only half a second slower than that of Flora Temple that for so long held the first place.

The trotting interests of the country will be much benefitted and the race meetings will be more generally popular if those managers who are now arranging the summer programmes for the various circuits will make some needed changes in their general plan. The Chicago innovation of last year in the frequent substitution of stakes for purses was an excellent one, and should be imitated generally throughout the country this season. The purses look well on paper, but they are by no means so attractive when the winner finds that he has really paid twenty per cent. of his winnings in a ten per cent. entrance fee, getting but half the large purse, if, indeed, he is not compelled to accept a compromise with the associations owing to their bad success with expected entries. There should be also radical change in the monotonous mile heat racing, and ingenuity shown in varying the programme after the fashion which obtains on the running track.

The Stockton Stake for two-year-olds to be trotted at the San Joaquin Valley Fair in September next closes on the first of February (Thursday next) and there is not a doubt that the nominations will reach such a number as to make it one of the richest of the season. It is for all colts and fillies foaled in 1881, heats of a mile, $50 each, $25 of which must accompany the nomination, and the association adds $500. The stakes are divided into "four moneys"—fifty per cent. to the first, twenty-five per cent. to the second, fifteen per cent. to the third and ten per cent to the fourth. The added money is divided in a novel manner. Each of the colts that win money in the race receives $100, and the sire of the winner $100. Address J. L. Phelps, Secretary, Stockton, California.

The "Breeder's Gazette" makes a mistake in the presumption that E. S. Stokes was not authorized to make the match on the part of Overman against Ewing. O. A. Hickok informs us that a telegram was sent to Mr. Stokes empowering him to act, and to make the match for $5,000 a side, one-third forfeit to be put up, and on the arrival of Overman at Salt Lake the balance to make good the usual half forfeit. It is also mistaken in thinking that the match is "around the stove" on the part of Overman, and if Col. Shaughnessy is really "willing," it can be consummated whenever he signifies that he is ready to post the amount.

In another column will be found an acceptance o Mr. Carroll's challenge from S. Brinkerhoff, president of the Dixon Coursing Club. Mr. Carroll has already found one acceptor, but there is no reason why he should not take the second one too, as he has plenty of dogs at his command. Of course Mr. Carroll has an equal say with Mr. Brinkerhoff in the matter of time, place, and especially judge, and we apprehend that Mr. Brinkerhoff, who is a gentleman of tact and a thorough courser, will waive his present demands should Mr. Carroll object. We would like to see Blue Jacket matched, and doubtless Mr. Gordon is an able judge, but we imagine that Mr. Carroll will not be likely to accept unless he has a voice in the selection of the judge.

BILLIARDS.

Progressive Billiards.

Much ink has been wasted and many tiradea of abuse have been indulged in to show which is and which is not the game of billiards to rivet the public attention. The authorities have been at loggerheads for some time on this subject, but no one has put forth a sensible suggestion to unravel the tangle, as they have all been too busy in putting forth their own schemes. Some have advocated cushion caroms, others have sought to prove that the champions' game with its corner-restricted table is the best, and a few—very few—have sworn allegiance to the straight game. When a new play is put upon the boards the manager is all anxiety to hear what the critics have to say regarding it, but so long as the public patronize his venture he cares little what the "free lance" has to say about the piece. This should be the case with billiards, and the best way to test the question as to which is the most interesting game played on the green cloth and with the cue should be left to the public. The carrying out of such a project is an easy one, and there are billiard enthusiasts enough in this city to put the scheme in practice at once. Let the players forget their differences for a time, and settle the mooted question as to which will be the best patronized game—the cushion carom, the champions' game, or continuous balk line. The all-rail contest is too monotonous, as the wizards of the present day can run thousands of points when they get the spheres bunched. There can be no doubt whatever that the cushion-carom game is the championship contest of the future. It is steadily advancing, but as the game is a very difficult one, it is comparatively slow. There is, however, a steady improvement going on all the time, despite what its enemies may say of it. The last match shows conclusively that it is advancing, and the time is not far distant when two hundred points will be run, and an average of a dozen or fifteen will be made in a five-hundred-point match. That this number of points will be made inside three hours is also a certainty, but we must have patience. The three-ball game was a slow one when first introduced, but its intricacies were soon overcome. So it will be with cushion caroms, but we must learn to wait. In the meantime, if there is any other game of billiards that will interest the public more than the disputed style let us have it by all means.—*New York Sportsman.*

Maurice Daly has refused to make a match with William Sexton to play a return game of billiards, cushion caroms, for $5,000 a side, until after the balk-line tournament, which is to take place in Chicago on March 26 next, as he says to prepare for such a match will interfere with his practice for the tournament.

(CONCLUDED FROM PAGE 49.)

Pilot, his dam Belle of Wabash by Bassinger, grandam by imported William IV.

The Moor died the fall of 1875, fifty-one colts being the total of his get. In this comparatively small lot he has four in the 2:30, list viz: Del Sur and Tommy Gates each with a record of 2:24, Sir Guy 2:28½ and Beautiful Bells 2:29½. These records were obtained when these animals were young. Sir Guy made his record when a four-year-old; at that age Del Sur trotted in 2:25; Tommy Gates was eight, and Beautiful Bells four years when the records were made. Good as this showing is the next generation exhibits a manifest improvement.

Sultan who took his sire's place in the stud at Sunny Slope was foaled in 1875, and served a few mares the spring of 1877. In 1880 his daughter Sweetheart, then two years old, got a record of 2:26½, and in the following year she trotted in an actual race 2:22½.

Her sister Eva, a year younger, in 1881 took the fraction off and marked 2:26, and it always seemed as though full credit was withheld from this wonderfully meritorious performance. That sisters two and three years old, and these from a sire which at the date was only six years, should make the mark of 2:22 and 2:26 on the same day are feats that may not be seen again for a long time. Nothing in previous annals can be compared to it, and had it not been for the glamourie which surrounded the youngsters from Palo Alto the whole country would have celebrated the performance. The 2:21 of Wildflower did not lessen the others, although it obscured the brilliancy, and meteor-like the brightest stars were paled by the intensity of the flood of light that followed the daughter of Electioneer. But the blood of The Moor was destined to play an important part before the curtain was rung down on this notable season of 1881, and when the yearling daughter of Beautiful Bells marked 2:36½ there was a parallel to the great doings of Wildflower.

Upwards of forty years before these startling performances were made William T. Porter, the editor of the old *Spirit of the Times*, wrote that "with the exception of Andrew Jackson Ahdallah was the most blood-like trotting stallion he ever saw." When he penned that sentence had anyone predicted that the union of the blood of these two stallions would produce a colt that in its yearling form would mark time that but few of the old trotters of that day could equal, the prediction would have elicited a contemptuous sneer. The gap between the patriarchs was not a very long one either. Ahdallah, Rysdyk's Hambletonian, Electioneer, Hinda Rose, Andrew Jackson, Henry Clay, Cassius M. Clay, Neave's Clay, Clay Pilot, The Moor, Beautiful Bells, Hinda Rose.

Then there came in other strains of the horses extolled by Mr. Porter, as the dam of Beautiful Bells, Minnehaha, united them in her pedigree. Her grandam, Nettie Clay, was by Strader's Cassius M. Clay, and the next dam by Ahdallah, and Strader's Clay was by Cassius M. Clay, and his dam by Ahdallah.

The subject of this sketch can also show a rich inheritance on the side of his dam and when Mr. Newland purchased him from Mr. Rose he was guided in his choice and made the selection on this account. He visited Sunny Slope with the intention of buying the best, the price being a secondary consideration, and the form of The Grand Moor being satisfactory, the blood of his dam Vashti settled the question, and he selected the son in preference to anything he saw. Her sire, Mambrino Patchen, a "full brother" to Lady Thorne, and combining Mambrino Chief, American Eclipse and Sir Archy blood was a token that the offspring must be all right in this important point. The get of Mambrino Patchen had achieved distinction on the tracks, and his daughters take high rank in the stud. He has several representatives in the 2:30 list and among others of his daughters there is Thornleaf, the dam of Cleora, who trotted last summer in 2:18¾, her first season in public.

The dam of Vashti was Kate Taher, by the Dunkin Horse, an animal that figured quite frequently in the trotting pedigrees of Kentucky.

In form The Grand Moor is a capital representation of the family. It is seldom that more "bloodlike" trotters are seen than are shown by the descendants of The Moor. Nearly all of them of fine size and highly finished. As the illustration exemplifies, this horse is of very fine shape; his color is a glossy black, in height sixteen hands, and of fine length of body. His legs are capital, thighs and arms muscular, and the lower portion showing plenty of bone and tendon. The hocks and knees are broad, and all the angles from the croup and withers to feet are right. That he would have trotted fast if given the opportunity is beyond question. We have seen him haul the heaviest kind of a breaking cart with a driver of 200 pounds in 2:50, and as there must have been over 500 pounds behind him it was a proof of speed and weight-pulling combined. Hitched to the same big cart but with a lighter driver, N. D. Pumyea, he trotted the mile in 2:42, and went through the backstretch in 37½ seconds.

Owing to the injury to Mr. Newland that left him totally blind, little was done with his trotters after the accident, and hence it cannot be said that The Grand Moor has had the opportunity in this line to show his family characteristics.

Had that chance been granted, there are good reasons for the belief that he, too, would have excelled and made a name which it must now rest with his offspring to perpetuate. As we have oftentimes stated California has a greater variety of trotting strains than any State in the Union. All of the Eastern blood that have obtained celebrity and others which have gained distinction in the land of their birth to add to the numbers. That the blood of The Moor will continue to figure prominently in the calendar is as certain as anything in the future can be foretold, and if we are not greatly mistaken this will be an addition to those who have achieved renown by the close of this year.

PAT LYMAN'S MERCED RACE.

The Merced Boys Unmercifully Taken in and Done for.

All the old sporting men in this State know Pat Lyman, the best runner, the best jumper, the best wrestler and the best all-round athlete generally of all the fat men in the country. Lyman, or Pat as he is commonly called, weighs about 250 pounds and is not less than fifty-five years old, but be is as active as many a younger and slighter man and at his own proposition to match any man who will come up to his weight can seldom or uever find a superior. Pat is as good-natured as he is fat and above all things enjoys a good joke even if the point of the joke and the laugh goes against him. Let a foot-race or a prize fight, or a wrestling match, or any kind of sport come off within twenty miles of Pat's residence and he is sure to be on hand with a few dollars in his pocket ready to bet on his favorite or if he can't find a match willing to take a trifle of odds and allow his opponent to make his own match.

But it is at a coursing match that Pat shines principally. He knows every dog in the State and pretty much what it can do, and has owned and bred more good greyhounds perhaps than any other man in California. Nearly all the first-class dogs around Sacramento are the produce of stock given to their owners by Pat, and he has several times found to his sorrow that dogs he has given away were a bit better than those he kept for himself and has had to accept defeat at the hands of his own stock.

When Pat was living in San Francisco he never missed a chance to go up with the crowd to the Merced coursing matches and generally had one or two of his own dogs on the card. Mission Girl was his favorite—a small, dark, brindled low running hitch, one of the best workers and the gamest runners ever seen and who would have won many a match but for a bad habit of pulling in slips and choking herself so badly that she ran blind at the start and lost most of her courses by being beaten out of the "first turn."

Whenever Pat went up to Merced to take part in a coming match he went there for fun and took good care that he had a hand in all the sport incident to the excursion. Very often he furnished a good deal of the sport himself, and he signaled his last trip to the City of the Plains by getting up a funny foot-race, that not only netted all his friends a considerable sum of money and gave them a heap of fun, but furnished an epoch in the history of Merced from which important incidents are dated to this day. "The year Pat Lyman beat Sam Ross," or "the next harvest after the fat man got away with the boys" is the current method of computing time according to the Merced calendar.

Merced, like nearly every other country town in California or in America, for that matter, possessed a champion foot-racer in the person of Sam Ross, a deputy sheriff of the county and a brother-in-law of A. J. Meany, the present popular sheriff. Ross was a fairly good sprinter for a country place; that is, he could run 100 yards in a trifle worse time than 10½ seconds, but the boys around Merced having timed him with an eight-day clock as running as fast as 9¾ seconds he naturally though he was a world-beater, and his friends shared his confidence in his ability to beat every sprinter in the country. After having defeated all the sprinters of the San Joaquin valley, Ross naturally enough sighed for other runners to conquer and eagerly seized the arrival of the Pioneer Coursing Club at Merced with a fairly good runner in the party as a chance to win fame and money.

The fast man among the coursers was Wilson Davidson, the secretary of the club, and while the members of the club were resting from the fatigues of their morning sport a match was made between Ross and Davidson, which Ross won pretty easily. This was the beginning of Ross' downfall and the match which was the indirect cause of the race that Pat Lyman won a year later.

When the Pioneer Club returned to San Francisco, they naturally enough talked about Davidson's defeat by a local man. The conversation was overheard by some persons who reported it to Archie McComb and Fred Davis, the well-known professional sprinters, who immediately started off for Merced to relieve Ross and his friends of their spare cash. Both men got a race with Ross and both beat him so easily that his estimate of his speed was brought down to a reasonable limit. But the victory of the professionals did not satisfy the Pioneer Club, and the next time a coursing match was held at Merced a gentleman accompanied the party who was able and willing to give Sam Ross four yards in one hundred and beat him a yard at the finish for as much money as the Merced sports could raise.

"Twice bit, once shy" remarked Sam when some one proposed to make a match. "I have had enough of San Francisco sprinters and don't want any more races."

At night after the first day's sport when the boys were all in the El Capitan bar room, Pat Lyman with an affectation of inebriety reeled up to the bar (he was nearly as sober as a judge) and remarked that he would run any man in Merced for $100.

"Oh you are fooling, Pat," said Sheriff Meany; "you know deuced well that Ross could beat a big fat man like you pretty near 50 yards in 100."

"All right," said Pat, "spozen he could I don't care, but he can't. Tell you what I'll do. I weigh 250 pounds and he weighs 150. Let him carry 100 pounds to come up to my weight and I'll run him 100 yards even or if you don't like that proposition I'll carry a man on my back weighing 140 pounds and bet $100 I'll run 50 yards sooner than he runs 100 yards."

The San Francisco boys all crowded around Pat and begged of him not to make such a foolish match, vowing and protesting that Ross could beat him easily. The more they begged of Pat not to make the match the more anxious the Merced boys got to take Lyman up believing that they had a soft thing and at last some of them began to chaff Lyman for backing down from his own proposition.

At this Pat grew indignant and swore he would make the match anyhow. He threw down $100 in gold, and the friends of Ross having staked an equal amount, it was agreed to run the race on a footpath to the west of the El Capitan Hotel at 5 p. m. the day following, after the coursing came off. The Merced boys thought they had a heap the best of the match as soon as it was made, and seemed so anxious to bet more money that out of sheer good nature the San Franciscans opened their wallets.

"Je wash!" roared a big granger from Plainsburg, as he booked a bet of $50 with old Captain Plaice, "this is a durned sight easier nor digging potatoes for a living. Why, man, it's just like finding the money. A man must be a blamed fool to think that such a big lump of fat as the 'Frisco man could carry 140 pounds and beat our little Sammy."

Before the crowd went to bed both parties had bet every available dollar on the match, and Old Bloss of the El Capitan wore a most unpleasant look, for he knew that no matter which side won he would have to file several board bills away in the archives of his office until their contractors should have recovered from pecuniary embarrassments.

It was decided that owing to the importance of the race and the large sum of money at stake Lyman should not be allowed to go out to the coursing grounds next day, but should stay in the city in charge of a couple of amateur trainers, who would see to it that he did not catch cold or eat of any food that might injure his wind. What the system of training was that these gentlemen adopted will never be known, but certain it is that it resulted in bringing Pat to the post next evening with a head bigger than than that of a sixty-gallon barrel and legs in a somewhat unsteady condition. Pat said that he had overtrained; his trainer said that he did not take to his work kindly, while on all sides the general opinion was that he would be beaten. Anyhow, when the men appeared on the track they were betting 2 to 1 on Sam Ross.

Now, the fact is that Pat Lyman, who is a smooth old boy if such a compound ever existed, had practiced this feat of packing a 140-pound man 50 yards a thousand times and knew that no matter what his condition he could cover the distance in from nine seconds to nine seconds and a half, fully a second or a second and a half faster than Ross could run 100 yards. Therefore he had taken pains to appear as poorly as possible to get the benefit of all the odds and had certainly succeeded admirably. He was dressed in a pair of carpet slippers, an undershirt and vest, rough pants and his huge bald head was enveloped in a big red bandana handkerchief. Ross on the other hand was the model of a sprinter; slight and clean of limb, he looked real speedy and his rig of tights, trunks, and spiked running shoes added to his looks one of compactness that made Lyman's attempt seem more ridiculous to the uninitiated. A man who weighed 140 pounds was soon procured for Lyman to carry on his back, Sheriff Meany was chosen starter and referee and the party then adjourned to the track on which the novel race was to be run.

It took some little time to measure off the track and place the men on their marks; Sam Ross at scratch and Pat Lyman at the 50 yard mark midway between start and finish. The match had not been extensively advertised in the Merced papers for the simple reason that Merced papers only come out once a week, but for all that the whole town of Merced, men, women, children, Indians and dogs had turned out to see the race. They formed in lines on both sides of the track leaving barely space enough for the runners.

Are you ready? asked Meany, and before he could get an answer Ross was flying down the track; Meany fired as soon as he could but Ross had covered full twenty feet before Pat Lyman got under weigh. The old man knew he had a little the worst of the start and did all he knew to stand off the advantage. Twenty yards from home he looked like an easy winner for he was running better than one-half a yard against Ross' yard but suddenly the man whom he was carrying on his back and who was a Merced youth tightened his grip around Pat's throat and came near choking him.

Pat suspected treachery in an instant, but could do nothing except yell out, "loosen your hold or I'll kill you when this race is over." The threat seemed to have the desired effect, for the young traitor let go his grip on Pat's windpipe, and freed from the incubus, Pat struggled up to the tape a bare winner just as Ross put his hand on his shoulder. From the flash of the pistol to the finish was just nine and three-fifths seconds, timed by myself and another timer of experience, so Lyman's performance can be understood as being a little faster than he expected to run.

Such a yell from the San Franciscans as greeted Lyman's victory I never heard before. Old Captain Plaice seemed nearly beside himself for joy, and Franklin, Tunstead, Carroll, Berry, and all the rest of the boys were equally pleased and vied with each other in doing honor to their champion. The Merced folks, especially Ross and his friends, were very much chagrined, for they thought for sure that they had the best of the match, but a few bottles of wine made all hands good-natured, though the lesson of defeat was taken so much to heart that it has been next to impossible to get any kind of a match in Merced since that day.

Where Fast Horses Come From.

It appears that the famous trotting horse Occident was in early life the locomotive of a grocery wagon, and the owner discovered his gait while the grocer's boy was delivering goods at his house, and bought the horse and trained him. And it also appears that the famous St. Julien was once employed in delivering milk—milk, that cheerful and nourishing beverage so much in vogue among infants, and whose good name has figured in so many scandals in connection with water and chalk. Shakespeare has said that honor and fame from no condition rise, and it is not strange that the fastest trotters in the country spring from milk and grocery wagons. The pace at which grocery wagons are driven, when the boy is out of sight of the old man, and on a good block pavement, is one that is calculated to develop all the latent talent a horse has got, and it is the same way with the drivers of milk wagons. Citizens who reside in the suburbs, on some level street, have noticed this many times and have remarked upon it. Away down the street an object appears, looking to the unsophisticated like a baby cart standing still; but the experienced mother knows better, and at once begins to gather her offspring off the streets. No sooner has she done so than a meteor in the shape of a grocery wagon driven by a red-headed boy flashes by, stops at the house on the corner, throws out a peck of potatoes, four or five brown paper parcels, a half dozen crook-necked squashes, a string of onions and a mess of cucumbers, and the next instant is gone from her gaze like a beautiful dream, and she fairly jumps as she turns and sees a milk wagon bearing down upon her like a runaway locomotive. Of course milk wagons use a bell, or a horn, but they drive so fast, the most of them, that the wagon keeps ahead of the sound. At least, a person very seldom hears the bell of a milk wagon, and goes out with the pitcher and milk ticket, without he finds the wagon has passed on to a house half a block away; so we judge that the wagon keeps ahead of the sound. It is not strange, in the view of these facts, that the fast stock of the country should come from the grocery wagons and the milk wagons. The only slow horse is the one driven by the peripatetic individual who goes about the streets yelling, "Apple, appels, pie appn-l-l-l-ls!" No horse who has listened to that for one day will ever be fast. Unless he is fast asleep. The fastest horse on the turf, if he was hitched to a pie apple cart and had that noise dinned into his ears for a week, would lie down and die. No; the man who peddles pie apples always drives a steady horse. He is obliged to have one of that kind in his business—*Peck's Sun.*

Pendragon on English Betting Laws.

An appeal case recently decided by Lord Chief Justice Coleridge and Mr. Justice Stephen is bound to possess great interest for racing men, inasmuch as it in effect prohibits the card-playing which goes on—or has gone on until now—among them as a matter of course when traveling out or traveling home again. The decision also shows what a curious thing is English justice as administered in English law courts. Because it is necessary to convict two or three members of the "broad-working" fraternity who have occasionally exhibited their ingenuity in railway carriages, the whole body of racegoers who as constantly as proverbially play cards in railway carriages will in future have to do without their favorite game or be considered rogues and vagabonds, and punished as such in accordance with the statute. Personally, I have small sympathy with people who cannot travel for an hour without producing the devil's books and playing nap, or bluff, or blind hookey, or whatever else best pleases them; but I cannot help thinking that it is nonsensical as well as cruel to stop them, especially as the law itself professes to have no objection to card playing qua card-playing, and only does so because it has been decided that a railway carriage is a place within the meaning of the Act of parliament. I don't think I ever played a hand at cards in my life during a railway journey; but no number of lawyers, whether elevated to the bench or otherwise, would make me subscribe to the present contemptible condition of affairs. We are asked to believe that a thing is wrong, not because it is wrong of itself, but because two gentlemen of the long robe choose to interpret a word in an Act of Parliament according to their own lights and prejudices. Neither Mr. Justice Stephen nor Lord Chief Justice Coleridge offers any objection to card-playing as card-playing; and yet both of them ought to know, if they do not, that by deciding a railway carriage is a place within the meaning of the Act, they make everybody who plays cards in a railway carriage guilty of misdemeanor.

Repeatedly before now I have had occasion to point out the monstrosities developed by this way of defining what is and what is not a place so far as the Betting and Gaming Acts are concerned. This time the trouble arises out of what is known as the Vagrants Act. The extraordinary, not to say imbecile, part of the business is that the law does not profess to interfere with card-playing except when card-playing is carried on to the danger, moral and pecuniary, of the grandmotherly-governed and awfully-protected public. To protect the public and prevent its hurting its poor little self, the law condemns all sorts of fair and comparatively innocent recreations. Because now and again cards are used for fraudulent purposes, we must in the future have no more card-playing. It would have been just as logical, in the old thimble-rigging days, to abolish the use of thimbles by special ukase, and to have put a ban upon the growth and importation of the pulse which played a part in these wicked and deplorable, dangerous and desperate, exhibitions. Several eminent lawyers are of opinion that Lord Chief Justice Coleridge and Mr. Justice Stephen did not think, when they gave their decision, that ordinary games at cards would in consequence of it have to be tabooed in railway carriages at the will of any obnoxious and non card-playing passenger. This shows how necessary it is that our Acts of Parliament should be drafted more in accordance with common sense and common fairness, So they are, when their drafters are in any way affected by them.

In all the Acts that touch upon the amusements and the recreations of the commoner classes we find this one dominant assumption, that whatever they do is wrong, and should be abolished. If that is not the intention it is the effect—and no man dare deny this sweeping assertion. Because one or two shopboys who had stolen their employers' money pleaded that they were tempted to do so by the love of betting, an Act was passed which made ready-money betting criminal among millions who never robbed or never thought of robbing anybody. Special exemption was made for such as do not belong to the commoner classes. In like manner, because one or two virtuous legislators discovered or thought they discovered, that some poor and misguided youth had gone wrong because of card-playing for beer or small silver, maybe copper, wagers, all England—that is, all lower-class England—was compelled to abandon card-playing except within the privacy of their own houses. Not only was card-playing made punishable, but dominoes, skittles, shove-halfpenny, and all other once-popular public-house amusements were put down by the iron hand of the law, or surrounded by difficulties which made their pursuit impossible, simply—so it appears—because they were the amusements of the lower classes only. All this while it must be borne in mind that the law never once assumed that these pursuits were wrong in themselves. The law simply asserted and still asserts that they give opportunity for the swindler, and thus must, in the interests of a confiding, an innocent, a hahylike, and pap-sucking public, be exterminated.

The yacht and boat racing on the King's birthday, Nov. 16th, was the most enjoyable day's sport of the kind ever known in Honolulu, but unfortunately the "cups" and "prizes" for the winners were only seen in the advertisements. They have not yet been presented to the winning crews and no one seems to know when they will be. One of the boat races on that day, in which a barge from the U. S. S. Alaska took part and won fairly by several hundred yards, caused some complaint. A race between the Alaska boys and a native crew was tried the day after, and although the native boat fouled twice with the Alaska boat the latter gained on the former and won the race, but the natives refused to give up the money they had staked. The officers and sailors on the Alaska concerned in the matter filed a protest with the U. S. Consul before that vessel sailed from Honolulu.

Preparations are being made in Honolulu for the approaching coronation of King Kalakaua, which is to take place February 12th. The festivities are to continue 12 days, and Thursday, February 22d, is to be given up to yacht and boat racing, etc. The programme comprises five events as follows: First—Coronation purse, prize $100, yacht race free to all. Second—Kalakaua purse, prize $125, barge race free to all. Third—Kapiolam purse, prize $100, six-oared gig race, free to all. Fourth—Lilinokalani purse prize $50, canoes using five paddles, free to all. Fifth—Diving contest, prize $25, free to all.

There is a real basis for the high prices of pedigree stock, whether sheep, cows or horses. It may seem absurd to pay $200 for a ram that weighs little more than 100 pounds, but if the progeny of this ram will shear eight to ten pounds of wool, while common sheep average five or six pounds, with the same cost of keeping, the use of the pedigree sheep as a breeder will pay heavy interest on much more than his increased price. It is not every farmer who can breed fancy stock with profit, but there is no one who cannot improve his herds by the use of the best male parentage.

To Save the Driving and Working Horse.

Not a few have learned that by putting the weight suddenly upon a small, round stone, or upon the edge of a plank on the sidewalk out of repair, lameness may follow that will cling to the person through life. Many horses are lamed in like manner from being recklessly driven where cobble stones are in the path, a step upon one of these, when the horse is moving a load or going at a rapid gait, being quite likely to strain the joint within the foot, or produce a like effect in some part of the limb. It is a wonder that so many horses go through life retaining a fair degree of soundness in body and limb to the last, when we consider the violent strains put upon them, the overheating, and exposure to inclement weather at the same time.

Neglect of the feet, permitting horses to be driven on ice at this season of the year without having the shoes sharpened, is the source of many a violent strain to joints, tendons, and muscles. Whether sharp or smooth shod, the driver can, if he will, always choose his ground. An ingenious, considerate driver, by looking a little ahead, may give his horse the most favorable footing, and at the same time keep his wheels out of ruts. It shows a great want of tact and judgment in men upon the road, when all follow the one beaten track, each one doing all he can to plow the rut deeper. If a halt is made, that the team may have a brief rest and regain wind, a prudent man will see that the team is brought to a stop on a descending grade, if he can avail himself of this advantage, as if heavily loaded the start causes unnecessary strain upon any other ground.

In an uneven country, whether a team is heavily loaded or not, great care is required both in ascending and in descending hills. A man may be, in a measure, pardoned for driving his team checked up on level ground, provided he occasionally loose the checks to give relief; but no one is excusable for driving up hill, whether loaded or not, without loosening the check rein. It will always be observed that a horse, while pulling at a load, unless he has a high, slanting shoulder, and has always done his work with his head checked up, will extend his nose, placing the air passages in as nearly a direct line as possible, as in that position his breathing—an important factor in his strength and endurance—is facilitated, while with his head checked up, the air passages are thrown into sharp curves, and free breathing rendered impossible. This is especially the case in ascending a hill.

Horse owners seldom reflect that the horse formed for going up hill easily to himself, may have a very faulty formation for going down hill and in performing the latter act is quite open to injury, unless great care be observed. Thus, a horse with a heavy hind quarter and loin, with wide hock and hind leg, may have this associated with a thick, upright shoulder and wide breast. This formation will enable the animal to ascend the hill quite easily; but that formation best calculated to stand the down-hill travel, namely, a high, slanting shoulder, being absent, such a horse is liable to injury in the shoulder and forelegs, unless driven down hill with great moderation. Such horses, if driven down hill upon a trot, are liable to injury at every step. A long hill, even though the load be light, should never be ascended without one or two stops being made, the strain upon the tugs taken off, if the load is heavy, by a block to the wheel, or, what is better, whether the load is heavy or not, turning the team and wagon diagonally across the road, which will render a start comparatively easy.

Anyone who has not tried this mode of refreshing a hard-working team while upon the road would be surprised at the invigorating effect of allowing a horse to eat a quart of oats during a stop of eight or ten minutes without unhitching, the head being released from the strain of the check rein in the meantime. A few minutes' access to grass, with the head at liberty, has a like effect. No sensible driver, let the wagon be ever so light, will keep his team upon a steady trot for a long distance, no moderation of gait being allowed. An occasional short distance upon a walk gives opportunity for regaining breath, and enables the horse to resume the trot without undue tax upon muscle and wind.

Discerning drivers say of some horses, that they have no judgment, they will go till they drop, and to be saved from being early stiffened and blemished, must be restrained and favored whenever put upon the road. Such horses should be held in the light of a luxury, that their spirited bearing and going qualities may stay to a good, old age. Horses of this class generally have good material in them—material that will wear well if not unduly abused. But in reckless hands, these high-mettled travelers, selling, when fresh from the country, up in the hundreds, soon find their way to the auction market for used-up horses, and are next seen crippling along at some menial service.—*Live Stock Journal.*

The Boston *Globe* is authority for the statement that there is a fashionable craze just now in the best society of Boston for Jersey cattle. That these beautiful creatures should be made pets of by those who have time and money to spend on them is not surprising. Through their great worth as a dairy cow, combined with their surpassing beauty and gentleness, they are rapidly coming to supersede other cattle in the estimation of those who admire fine animals of this class. They are as pretty to look at as a fawn, and their milk, of wonderful richness, is from 33 to 40 per cent. cream, or even more. In some of the fashionable suburbs of the hub it is as much the thing for ladies to have their pet Jerseys as it is for London ladies to lavish their love on lapdogs—and surely the custom is one more creditable to them.

If you want to keep hogs from plowing up your fields, I can tell you a of a plan adopted with complete success by the late cattle king, Jacob Strawn, of Morgan county, Illinois, who was also a very extensive raiser and dealer in swine. Mr. Strawn's plan was to have what he termed "snouting day," when all hogs to be operated upon were collected in an inclosure. The hogs in turn were caught and brought to a block of wood, when a man with a sharp chisel sliced off the rooter on the top of the nose. They were then turned into a clover pasture and were perfectly harmless as far as plowing up the ground. I have seen hundreds of hogs in Mr. Strawn's fields, but never saw any damage done by them. The plan is simple and effective, and does away with the expense of buying rings.

Mr. Alvord, in his address on the factory system of butter making, delivered at Rutland, before the Vermont Dairymen's Association, stated that the farmers of Franklin county, Mass., sent off, during the year 1880, 400 tons of butter, which brought on the average about three cents per pound less than creamery butter from factories in the vicinity. This loss of three cents equaled in the aggregate the neat little sum of $25,148, which might have gone into the pockets of the farmers of Franklin county, and at the same time have saved their wives an unlimited amount of hard work and unceasing care and anxiety.

A large boathouse in the harbor of Honolulu has been completed for King Kalakaua, in which he will keep his new yacht. He has another house for his small boats. Both are set on piles on the edge of deep water.

Montreal's Carnival.

Montreal citizens are just now looking forward to much pleasure from the winter carnival of outdoor sports to take place during the last week of January. It is expected to be the inauguration of annual events of this kind, and preparations are being made on a large scale to insure its success. Winter sports in Canada a quarter of a century ago were confined chiefly to the boys of English and Scotch families, then resident in most of the large cities. In the young country the seniors had so much to do with earning the bread and butter that sports with them were looked upon as so much time thrown away. The French element seemed to find no time for outdoor amusements then, the dances of La Belle France and more comfortable fireside games claiming most of their attention. They have not entirely recovered from their apathy in this respect, for while there are many a score of snowshoe and skating clubs throughout Montreal and the suburban villages there are not more than one or two in which the French descendants, leaving the sports of the fireside, indulge in the more vigorous ones of the hillside, valley and ice-locked ponds. The boys of twenty-five years ago are the leading men of Canada to-day, and to their credit it may be said that their love for outdoor sports has grown with them. From the late Sir Hugh Allan down to the youngest member of the snowshoe clubs all have gone into the work of preparing to make the carnival a success. The result is the preparation of an excellent programme.

An ice palace is to be erected at some prominent point of view, its main turret to reach 150 feet, while its other dimensions will be in keeping. This will be illuminated at night with the electric light, and the effect is expected to be very fine, especially as colored glass is to be used in its construction.

Two days of trotting races are arranged for, these to take place on the frozen bosom of the St. Lawrence. Cutters, of course, will be attached to the trotters, and some excellent prizes have been provided for one day of gentlemen's roadsters and money prizes for the professional men.

There will also be a grand curling bonspiel, in which all the clubs under the jurisdiction of the Royal Caledonia Curling clubs are expected to compete. This game is not much played here,

A very attractive feature of the carnival will be the skating night at the Victoria rink. A grand historical procession in connection with this is on the programme, which, seen in the light of a thousand jets, will have a very fine appearance. An afternoon will be devoted to snowshoe races. The snowshoe has almost ceased to be utilized for anything except pleasure tramps across the country. At one time in the history of Canada the snowshoe was exceedingly useful. Her Majesty's troops were always instructed in its use. In fact, an army would be useless in this climate during the winter without it. But nowadays moonlight strolls with the ladies, whose feet it is the duty of the cavalier to fit with the snowshoe, are one of the attractions to make snowshoeing a sport. Then the rendezvous of each particular club in the country some three or four miles away, sometimes a dozen, makes a long tramp from town. The more stormy and dark the night the more jolly the company generally is. Sometimes nearly a hundred snowshoes are in Indian file, following their chief. Often in the racing competitions Indians are pitted against white men, whom they always outrun in the long distances, but are beaten in the short distances up to half a mile. On the evening of the snowshoe day there will be a procession of snowshoers by torchlight. The route will be taken up the side of Mount Royal, the snowshoers to disperse at the summit, each club seeking its own headquarters.

Tobogganing, or Indian sleigh coasting, will monopolize one evening, and the slides at Cote street, Antoine, will be illuminated with electric lights. As this sport is almost exclusively Canadian a word may not be amiss in description of it. The tobogan, or Indian sleigh, is made from long flat strips of hickory of a thickness of from one-eighth to one-quarter of an inch and from eighteen inches to thirty inches wide, according to desire, while the length may vary from three to seven feet. The long strips that are fastened together to make the desired width are turned up at one end, after the manner of the old Dutch or "turn-up" skate of twenty years ago. Upon the tobogan may be placed a cushion or not, as to choice. Generally there is a very good cushion on each. The steering is done by the gentleman in charge of the tobogan, who sits in the stern of the craft, with his cargo of ladies fair in front of him. Some tobogans will hold five or six adults very comfortably. All who make the trip get upon the tobogan, just on the brow of the hill or slide. The steersman is the last to embark. He is supplied with a sharp pointed hickory stick, about four inches long, one held in each hand. He is gently pushed over the top of the slide with his freight of ladies. If he finds his craft veer to the right he strikes hard with the left hand stick into the snow to bring her straight again. All the time he and his tobogan are careering toward the foot of the hill like the wind, and he must be clever if he would miss an upset. His bevy of fair damsels do not like to be upset and rolled unceremoniously over the generally frozen surface of the hillside. Thus he exerts all his energies, and if he is strong and clever brings his craft safely to the hill bottom. Then there is a walk back in the moonlight or the torchlight to the summit of the hill and the ride is repeated. But while the steereman must know his business in regard to the safety of his craft he must also be accomplished in the knowledge of how to upset the tobogan into a soft snow bank. Some of the jolliest of the parties rather like to be suddenly hurled into each other's arms in that manner, and have their stout beaux pull them out again. The advantage of the tobogan over the bobsled is that on the former a spill means only a shake or two. As the tobogganer skims along with only an inch between his body and the snow he has not far to fall when the upset comes. Woe betide him, though, should he run into a tree. A few lives have been lost in this way by reckless and venturesome gentlemen.

But, leaving the outdoor sports, attention is drawn to the grand ball at the Windsor Hotel, which is to close the week of carnival. The Governor and all the provincial lieutenant-governors, members of the Cabinet of Canada, mayors of New York, Boston and other American cities, governors of States adjacent to Canada and mayors of Canadian cities are to be invited to this ball. This, it is hoped, will be the crowning event of the carnival. Arrangements are being made by railway companies for excursion rates during the week, and should the Committee of Management meet with the assistance of Jack Frost, and obtain fine weather, very much enjoyment will be had by those who love the Canadian winter sports.—*Montreal Cor. New York World.*

Northwest ducks, plover and other migratory game birds are quite plentiful at the Hawaiian Islands, and sportsmen are having fine times shooting them.

Christmas day was celebrated by rifle shooting at Wailuku, Maui, and by horse racing at Kapaa, Kauai.

THE GUN.

Indestructibility of Game Birds.

That every question has two sides is admitted, tacitly or overtly, by every one; and if it has not been already proved that the destruction of certain of our game birds is inevitable, in spite of existing laws, I would like to say a few words in support of the other side, and show, if possible, by advancing such theories as have seemed to me rational and consistent with the point in question, that the total extinction of our game birds is next to impossible.

In the first place, it is noticeable that the change of habits of birds ever tends toward a greater ability to escape their pursuers, and this change, therefore, ameliorates their instinct of self-preservation, which is paramount in all the animal kingdom. Witness the difference of habits of the ruffed grouse of the Maine and Canada woods and of those in the much-shot-over districts of Massachusetts, New York and Connecticut. I venture to say that of seven birds flushed in Eastern Massachusetts, not more than one is ever killed, day in and day out.

To what limit this change may reach, we know not; but it needs only to instance the increased development of this faculty to evade their enemies to show that it is sufficient to meet the dangers to which they are exposed.

Doubtless, too, this faculty is hereditary, and birds that have once associated the sound of a gun to proximate danger to themselves, and the voice of man to imminent peril, will in course of time hand down to their offspring a like association of perceptions.

Again, those who assert that certain quarters are shot over too much for a continuance of its game supply must, from the very terms of their assertion, admit also that in those same quarters the birds never die a natural death of old age, which entails the admission that none but the young, relatively, and healthy survive till succeeding spring to breed—i. e., only those that can and do reproduce their kind.

That, owing to an undue persistence in their destruction, quail and grouse make partial migrations from the localities where they were reared to others more remote and better suited to their peace and rest, none but the blindest will deny. This holds equally true of deer.

After being hunted and hounded for some time in the Plymouth Woods, Cape Cod, there appears to be a decrease in the number of deer, and at the same time a corresponding increase in the number of those at more southern parts of the Cape; from this fact it is fair to surmise that they were driven from their wonted retreat to others less frequented.

To revert to migratory birds, it is well known that wildfowl, when disturbed at night on their resting grounds (or more properly speaking, waters), will forsake those waters, and not, as is generally the case, return again in the same season at least; this, far from tending toward their destruction (the popular view), only increases their chance of life, rendering them, as it does, more shy, vigilant and suspicious for the future, which in turn puts them within reach only of the most accomplished sportsmen—a very small class of men.

Furthermore, when birds are shot in large numbers, the markets become glutted, and the price of the birds being lowered, offers less inducements to the market shooter, and ultimately the slaughter must cease.

Of the extinction of hay snipe little or no fear need be felt. These birds are so prolific, their breeding grounds for the most part so remote, the demand for them in the market, comparatively speaking, so small, and their season of appearing and reappearing on our shores so untimely for active exercise or even for sun-basking, that their total extermination, however great the increase of breech-loaders, is impossible. In an out-of-the-way corner somewhere in the Gulf of St. Lawrence, I have for the past three years shot these birds, but noticed no decrease in their numbers, except of the golden plover last season, which, however, I attribute to some freak in the weather when the birds were at sea migrating, and so perhaps altered their line of flight.

Other reasons, analogous to, but less salient than those already shown, might be given in support of this view of the question, but if I have added any hope to the despondent and complaining class of sportsmen, who are forever bewailing the dearth of game and its speedy extermination, of which I am heartily tired, I have won my point. To do more would but be needlessly trespassing on your space.—*H. W. A., in Forest and Stream.*

The New Oregon Game Law.

The revised game law went into effect in Oregon on the 1st inst. It is now a misdemeanor in Oregon to kill any buck deer between the 1st of November and the 1st of July of each year, doe or fawn for four years; or to kill elk, moose or mountain sheep from the 1st of January to the 1st of August; or to kill or have in possession between the 1st of April and the 1st of September any wild swan, mallard duck, wood duck, widgeon, teal, spoonbill, black or sprigtail duck; or, between the first day of April and the fifteenth day of June of each year, for any purpose, take, kill, injure or destroy or offer for sale any prairie chicken or sage hen, or between the first day of January and the fifteenth day of July of each year, take, kill, injure or destroy or have in possession, sell or offer for sale any mountain or brook trout. It is also provided that "every person who shall within the State of Oregon at any time after the passage of this act destroy or remove from the nest of any mallard duck, widgeon, wood duck, spoon-bill, gray, black or sprigtail duck, prairie chicken or sage hen, grouse, pheasant, quail or partridge, or other wild fowls, any egg or eggs of such fowls or birds shall be guilty of a misdemeanor." The penalty for violating any provision of the law is "a fine of not less than $10 nor more than $100, or imprisonment in the county jail of the county where the offense was committed, for not less than five days nor more than three months, or both such imprisonment and fine. One-half of all moneys collected for fines for violation of the provisions of this act shall be paid to informers and one-half to the district attorney in the county in which the case is prosecuted."

J. L. G. Smith has a sand-hill crane, which he winged some time ago. The injured wing healed rapidly, but not until the crane had been domesticated and used to following Mr. Smith over the hills and far away, and answering to his whistle. Yesterday the crane went walking, as usual, following Mr. Smith to the hills, but missing each other, Mr. Smith arrived home, and could see from the springs the crane walking up and down on the summit of the mountain, eagerly searching for him. He then gave a long blow upon his whistle, when instantly the crane rose half a mile in the air and circled around until it saw its master, and, gradually descending, it lit at his feet. The bird is a great curiosity at the Hot Springs, and is thoroughly trained.—*Wood River Times.*

Coots.

Some gentlemen who are pretty well up in gastronomic science have been experimenting with coots of late. The birds were skinned, soaked in saleratus water and, properly prepared, were said to be good eating. The skinning particularly is essential. It is said to be the skin which contains the fishy oil which renders the meat of the coot disagreeable to eat. Therefore when the skin is gone the flesh may be eaten. Most people, no doubt, will prefer the mallards and the canvasbacks; but coots are just now, and usually, more plentiful than these. The coot is somewhat easier to be killed also. He will scull away from you with a side glance from his red-rimmed eye as if "keeping an eye on you;" but he will keep on swimming and will defer the exertion of flying as long may be. This is when he is alone. When in flocks the coots will fly off together; but single ones are loth to fly, and are diligently hunted by the small boy of the period. In the creeks and marshes around this city, and more particularly around Oakland, the coot abounds. In the large bays they congregate in great flocks. The long pier at Oakland seems a favorite place for them and thousands may be seen swimming about in that region at all times. They evidently tear the mussels off the piles, for they are often seen with the mussels in their mouths.

Some people imagine the coot to be allied in some way to the cat. At all events it is to the bird family what the cat is to the quadruped. If a cat has nine lives a coot has nineteen. A boy will shoot a coot, 50 feet off, through the head nine or ten times and put several more charges of shot into the pope's nose portion of his anatomy as he repeatedly dives. Finally the coot will get so full of shot that—to speak nautically—he will hare less freeboard than his mates, sinking till only his tail feathers and head appear above the surface. Even then he will keep diving and turning and performing aquatic gymnastics until clubbed and mashed with an oar or stretcher, when he gasps and rolls over; as the boy grabs at him he rolls over several times more but is finally caught and thrown into the boat in a comatose condition. After about an hour the boys hear a splash and behold there is that blasted coot overboard and swimming away as lively as if he had never heard of gun, shot, boy or boat before. And he seems to be in a much better condition for swimming fast than before he was ballasted with lead like an English cutter, which may account in some way for that class of boats sailing fast. At all events away goes the coot and if there is any tule or grass or weeds about he will hide himself in such a way that it takes an hour or so to ferret him out. When finally killed he is not any good anyhow, unless treated as we have described in the first part of this screed.

Crack Shots.

Last Sunday at Birds Point, Alameda, a twenty-bird match was shot for $20 a side between Mr. J. S. Gregory and Mr. John Ferguson. It is true that the pigeons were not an extra lively lot, though there were a few hard birds among them, and take it all in all, as the following scores show, there was some excellent snap shooting done:

J. S. Gregory	1 1 1 1 1 1 1 1 1 1	
	1 1 0* 1 1 1 1 1 1 1	
Total		19
John Ferguson	1 1 1 0 0 1 0 1 1 1	
	1 1 1 1 1 1 1 1 1 1	
Total		17

Before the above match was shot Mr. Merrian bet Mr. Ferguson $20 that Mr. Gregory would score five birds out of the twenty-five pigeons more than Mr. F. When the match of twenty birds was shot off, the string of five extra birds was counted on the twenty-bird score to make the twenty-five-bird match. In this Mr. Ferguson was the winner as the following shows:

Gregory	0	1	1	1	1—4
Ferguson	1	1	1	1	1—5

In the first match Mr. Gregory missed his thirteenth bird but as the * shows it died out of bounds. The shooting was from plunge traps, twenty-one yards rise and eighty yards bounds.

Trap Shooting at the Islands.

On the afternoon of New Year's day a party of gentlemen at Honolulu engaged in a pigeon shooting tournament. Some of the shooters were amateurs, and as the sun was shining in their faces and a strong breeze blowing, the majority of them made poor records. Ground traps were used, rise of thirty yards, eighty yards limit. Following is the result:

	Total birds.	hit.	missed.	sweeps.
J. N. Hayley	16	11	5	3
A. N. Tripp	12	8	4	2
J. Smyth	16	9	7	2
C. N. Arnold	15	8	7	1
J. Arnold	9	3	6	1
W. Unger	13	6	7	0
D. Monsarrat	7	3	4	0
J. H. Black	13	4	9	0
J. M. Monsarrat	6	1	5	0
O. Wroughton	12	2	10	0
Totals	119	55	64	9

SHOTGUNS AT SCHOOL.—We are informed that up in Tilden School District shotguns are taken to school for the purpose of killing geese. When a thick flock passes near the schoolhouse, they sometimes fire from the windows. About a week ago the teacher sent two boys by the name of Jones and Laughlin, to bring a bucket of water. They took their shotguns along. On the way one of them was working with the hammer which seemed to be out of fix; the gun was accidently discharged and took away the right fore finger of Jones.—*Stanislaus News.*

A party of five men of the Cordelia Club were up the river on a hunting trip last Saturday; the hunters found plenty of sport sculling in the sloughs for ducks. The only way to bring down the toothsome can is to lie behind blinds and wait the flight as when these birds are feeding they keep in the open water where they see all who approach, whereas teal and small ducks feed along the banks of the sloughs. The ducks are in rather poor condition, especially the teal. One party brought down 150 ducks; of these Mr. Friander got 56 and Fred Butler came in with a fine bag of cans.

The Trap at Stockton.

On Monday last there was a bit of a pigeon match—or rather a series of matches—at the grounds of the O'Neil Gun Club, on Hohenshell's place, north of the city. The first match was at ten single birds and six double birds each, usual rise and bounds, entrance $10 each, one prize to be made of the entrance money, and the score was as follows:

C. J. Haas	1	1	1	1	0	1	1	1	1	1-11	11	11—15
Cy. Hohenshell	1	0	1	1	1	1	1	0	1	1-01	01w	
F. Leffler	1	0	1	1	1	1	1	1	1	1-01	01w	

Mr. Haas pocketed the $30.

The next match was at six birds each, $5 entrance, usual bounds, and Haas, Cy. Hohenshell and F. Leffler were handicapped by twenty-six yards rise to twenty-one yards for the other participants, the money to be divided into three prizes. The result was as follows:

C. J. Haas	1	1	1	0	1	1	—5
J. Smith	0	1	0	w			
B. Hohenshell	1	1	1	0	1	1	—5
F. Leffler	1	0	1	1	1	1	—5
H. Grattan	1	1	0	1	1	1	—5
E. Leffler	1	1	1	0	1	1	—5
Frank White	0	1	1	1	1	1	—5
W. E. Saunders	1	1	1	1	0	0	—4
Cy. Hohenshell	1	0	1	1	1	1	—5

There were not birds enough to shoot off the ties, hence the money was divided between those who killed five of the six birds. There were other matches, but the scores could not be obtained.—*Stockton Herald.*

At San Bruno the duck shooting is quite lively and interesting on windy days when it is too rough for birds to remain peacefully on the bay. There is no morning flight and but very few come in the evening, but let a strong, rough wind spring up, such as we had a week or so ago, and the marshes are alive with birds. Messrs. Precht and Brown were down on several windy afternoons lately, and had excellent luck.

The explosion of the Powder Works last Sunday caused thousands of waterfowl that were feeding in that vicinity to take wing and fly away to the north and south. No doubt the birds thought it was some sort of a new-fashioned market hunter coming among them. The hunter—Death—was abroad and his shots were, indeed, death-dealing, but he was after larger game.

Diver skins are now worth upwards of 75 cents each and any successful hunter can make quite a snug little sum of money by hunting on the bay. From now on, divers will commence to come in in large number to these waters. We understand that Mr. Jas. Payne is going to hunt these birds for their skins as soon as circumstances will permit.

There is no shooting done to speak of at the preserve ponds up in the marshes. A great many sportsmen go up regularly every week, but they all hunt in the sloughs, as all of the large water fowl stay around in water and along the banks. Canvasbacks and mallards are quite plentiful and the shooting lively and interesting.

The trains last Saturday evening and Sunday morning were actually packed with crowds of hunters bound for the lower bay marshes. On the return nearly all expressed themselves satisfied with their excursion and to judge from the size of the bags there was no cause for complaint.

Duck hunters are having considerable success in bagging canvasback ducks during the cold nights in the tules below town, says the Napa *Reporter*. Mr. George West shot thirteen one evening of last week, while others report good luck in bagging wary aquatic fowl.

A pigeon shooting match will take place at old Mountain View to-morrow. The contest will be at fifteen birds, twenty-one yards rise. First prize $100, second $60, third $40. Several of Redwood City's crack shots have signified their intention to compete.

Last Saturday evening Mr. Ed Ladd and Mr. Gould went down to Alvarado and spent several hours shooting by moonlight and had good luck. They also hunted on the day following. The result of their trip was 80 ducks, all of which were in good condition.

The recent cold weather has made duck hunting less attractive than usual. Rousing out at 4 a. m. with ice on the ponds is not as much fun when the time comes as it looks the night before. However, there are plenty of enthusiastic ones to do it.

There have been two matches arranged to take place at Adams Point next Sunday—one between Nick Williams and J. W. Scott, and the other between Nick Williams and Jos. Ghiradelli. Conditions of both, 50 clay pigeons each, 18 yards rise.

Small ducks are quite plentiful in the marshes up the river but while there are larger birds to shoot at, they are not disturbed very much even by market hunters. It is said that the San Rafael marshes are alive with teal and widgeon.

Last Sunday, Mr. Putzman and a party of nine gentlemen were down at the quail grounds at Mission San Jose. Mr. P. killed ten of these pretty game birds, making the largest bag of the day.

The Cordelia Club, instead of giving up their grounds for the season, as was expected, will hunt there another month, the "cans" having come in.

Capt. Chittenden with the yacht Lolita will remain with the Cordelia Club till the 15th of February.

The Alvarado marshes are very much frequented during these days.

The many prominent billiard experts in the East are hard at work practicing for the coming tournament. Shaefer seems at home with the continuous balk line and runs 100 points quite easily. Slosson does not like the game, but is getting along well with Randolph Heiser as a trial horse. The latter does not appear to as great advantage in the new game as at cushion caroms. Daly is devoting all his spare time to the new game and is improving rapidly. The game is much to his style of play, and already he is looked upon as the probable winner of the tourney. Sexton is playing the game well, but does not like it as well as the straight game, where he is so much at home. The other players all express themselves as pleased with the new departure, as they think it gives them a chance to win a championship.

Jay Beach, proprietor of the Cascade Stock Farm, Lake county, Oregon, recently sold to Joseph Buchtel of East Portland, b f Cesnola, 2, by Altamont, dam L. S. Dyar's Kate, by Mike, a son of Vermont. This filly is nominated for the three-year-old Breeders' Stake for 1883.

The palace car of the Fish Commission, stocked with carp for this Coast, left Washington on the 23d inst. for this city via. the southern route. Fish for Oregon will be sent up from here by steamer.

BICYCLING.

Bicycle racing between professional riders is fast becoming popular in this country and men who have become identified with other forms of athletic sport have taken to bicycle riding. Among these are George Gaisel, the oarsman, and Frank Hart, the colored pedestrian. Both have entered the twenty-six-hour race which will be held on January 26 and 27 at the American Institute Rink, New York. The entry list is made up of the following well-known riders: John S. Prince, of Boston, the champion of America; W. G. Morgan, who has the best record in this country for a six-day race (twelve hours a day); William M. Woodside, the ex-amateur, who also holds the amateur championship of Ireland; W. Smith; William Olliver, of England; Thomas and George Harrison; James Murphy; Thomas Mellon and Mlle. Armaindo, the champion female bicycle rider, who has the best outdoor record for fifty miles in America. The race will be for the championship and a trophy valued at $200. On the evening of the 26th inst., John S. Prince and William M. Woodside will race twenty-five miles for $200 a side. The London *Sportsman* says that John Keen, the famous bicycle rider, will leave England for this country the latter part of this month, his intention being to make a match with Prince.

A meeting of Los Angeleuos interested in bicycling was held last week, at which the Los Angeles Bicycle Club was organized, and the following officers elected: President, Geo. A. Hackstl; Captain, C. H. Wedgwood; First Lieutenant, Jas. W. Lancaster; Second Lieutenant, H. I. Millard; Secretary and Treasurer, L. E. Meyers.

THE RIFLE.

California Schuetzen Club.

The California Schuetzen Club inaugurated the shooting festivals of 1883 with one for the benefit of a landable purpose indeed, namely, in aid of the sufferers through the floods in Germany.

Sunday last, the shooting came off at Alameda Schuetzen Park and proved a grand success. As at the prize shooting instigated by the California Schuetzen Club for the benefit of the Veteran's Fund, last year, a handsome surplus ($177 50) was realized, the full amount of which (700 Reichsmark) was, Wednesday last, cabled to the President of the German Reichstag in Berlin for distribution among the sufferers.

Forty-one prizes were contested for at the match, and the shooting was remarkable for the highest as well as the lowest score in three shots (Wm. Ehrenfort with 74 out of 75, and John Horstman with three, the lowest score ever made in a match. Dr. Boyson offered a valuable silver fruit stand for most rings shot during the day which was won by Philo Jacoby with 2,635 rings, and the latter's prize, a silver medal, for second most rings was won by F. Boeckmann with 1,097 rings. Following is the correct list of prize winners:

First bullseye, forenoon, Philo Jacoby.
Last bullseye, forenoon, Chas. Sagehorn.
First bullseye, afternoon, Philo Jacoby.
Last bullseye, afternoon, Philo Jacoby.
Most rings, PhiloJacoby, 2,635.
Second most rings, Boeckman, 1,097.

For Charity.

Last Sunday the California Schuetzen Club held a shooting match at their range at Alameda. The intention of this match was to help raise money to aid the sufferers in Germany who are made destitute by the floods. The prizes offered to marksmen were both elegant and costly. The following are the scores made:

Wm. Ehrenpfort, 74 rings out of a possible 75; John Hortsman, 3 rings (lowest possible); A. Strecker, 91 rings. First bullseye in the forenoon, Philo Jacoby; last, C. Sagehorn. First and last in the afternoon, P. Jacoby. Jacoby made 2,635 rings, the highest during the day; F. Boeckman, 1,097.

On Monday evening last the prizes were distributed to the lucky winners at Turn Verein Hall on Post street.

RIFLE NOTES.—There will be considerable rifle shooting done at Shell Mound Park to-morrow. It was expected that four contestants would enter into a match for $20 a side, but we hear that only Messrs. Linville, Brown and McElhinny will enter and shoot for a purse of $60. The conditions are 100 shots at 200 yards. The regular monthly rifle practice of Company C, First Regiment, that usually takes place on the 1st of every month, will take place to-morrow. Owing to regimental and other business, the company have neglected practice for some time, but from now on the members will have to practice on the first Sunday of every month. Marksmen are looking forward to a lively season in rifle matters this year. Unusual interest is manifested in target and trigger, as may be seen by the several matches that are already on the tapis.

Mrs. Dr. Ruth, the rifle sharp, is now running a shooting gallery in Johnsonville, Plumas county.

COCKER SPANIELS.—The following entries are reported for the American Cocker Spaniel Club's Produce Stakes, to be competed for at the forthcoming bench show of the Westminster Kennel Club, New York, May, 1883:

Beatrice, Hornell Spaniel Club.
Black Bess, Dr. J. S. Nivens.
Chloe II, Mr. F. F. Pitcher.
Curlew, Hornell Spaniel Club.
Dolly, Dr. J. S. Nivens.
Feather, Mr. F. F. Pitcher.
Flirt II, Hornell Spaniel Club.
Gypsey, Mr. W. M. Bowes.
Lady Bath, Hornell Spaniel Club.
Madge, Hornell Spaniel Club.
Mignon, Mr. Eugene Powers.
Nellie M., Hornell Spaniel Club.
Nina, Mr. E. C. Hale.
Prin, Hornell Spaniel Club.
Queen Vic, Dr. J. S. Cattanach.
Topsy, Hornell Spaniel Club.
Toronto Jet, Mr. S. F. Kirk.

Five boys belonging to the United States Ship Independence had a pedestrian match for a small purse at the Navy Yard last Monday. The winner, a Mr. Lawton, was timed 5⅝ miles in 46:45 and wants to challenge any one in the country. He is unduly excited.

POULTRY.

Questions Answered.

In reply to several who have written me concerniug the communicatiou from Mr. Griffith which was pnblished some weeks ago, I would say that I induced a friend to seud for some of the "dried vaccine blood" that Mr. Griffith offered to give away, aud in reply we received a copy of the *American Poultry Adviser* with a red haud stamped on the corner, and underneath the haud these words: "This red haud is stamped with vacciuating blood." The hand looked to me like red ink, and it struck me that that was a queer way to seud "vaccine fblood," and I didu't see what the *Adviser* had to do with the matter auyhow—so I set my wits to work to find ont the true inwardness of the affair. While I was thinking the matter over and getting madder and madder as light dawned upon my miud, one of the farm and fireside papers came to hand in which I found an editorial comment ou Mr. Griffith's communication and its connection with that precious sheet the *American Poultry Adviser*. The article concluded about as follows: "By means of the abundant gratuitous advertising thus obtained the *American Poultry Adviser* has probably obtained a respectable list of names of poultrymen, some of whom may be duped into paying $1 25 for the *Adviser* aud its secret recipes." I don't know as I have given the editor's exact words, for the paper containing the article has been mislaid, but I have given the substance of the paragraph referred to.

To those who have asked my opinion concerning the egg-preserving recipe, chicken cholera cures, etc., I say: Let everything that has not a square, houest look on the face of it severely alone. When anybody offers you a splendid chance to make a fortune for the modest sum or $1 25, ask him why he don't go ahead and make the fortune himself. Whеu somebody else offers you "one dollar's worth" of auything for "ten cents," ask them to deduct the ten cents from the dollar's worth and remit the other niuety cents by mail post-paid. Whеu another chap offers to seud to all who will send their addresses (and "two three cent stamps to pay postage,") "valuable information npou poultry matters," inform him that the leading poultry journals and agricultural papers contain all the "valuable information npon poultry matters" that anybody knows anything about. When any man, or any set of men calling themselves an "Association," offer you "pure-bred fowls and eggs, the best in the country" for less than half what the breeders who have a uatioual reputatiou ask for fowls aud eggs of the same breed, make up your mind that the "Association" eggs will be worth less thau half the price asked by first-class poultry breeders. Get your wife, or daughter, or sister, or somebody to work on card-board the legend, "the best is always the cheapest," and hang it up where you will see it every day of your life; and when you are tempted by delusive "ads" of the best stock in the couutry at rniuation prices, hang that motto around your neck and wear it until Satan aud the cheat ads cease to tempt you.

Now that I have cleared away the rubbish and got a pile of letters that have been ou my hands for a month out of the way, let us see what comes next. Here we have it; a letter from a man who wants a breed of fowls that will lay, ou au average, from 175 to 200 eggs a year.

My dear sir, I am iu the same predicament exactly! I want a breed that will lay from 175 to 200 eggs in a year, but after doing my level best with the majority of the standard breeds I have concluded that it will be some time before I get the desired breed. Hens that will lay from 175 to 200 eggs in twelve months are like angels' visits—"few and far betweeu." If you want hens that lay the greatest number of eggs regardless of size, get the Hamburgs; for winter layers, get the Asiatics, or Plymouth Rocks. I can assure you that any breed of fowls will prove profitable if well cared for.

Last ou the list comes the man who wants to know if it will pay to raise early spring chickens for the Chicago market. Pay? of course it will pay anybody who lives within a reasonable distance of auy city market to raise early chickens.—*Fanny Field in Prairie Farmer.*

The Ostrich Kick.

When a farmer goes iuto a savage bird's camp he takes with him a thorn pole, with a branch or two of the thorny bush left on the end. This is called a "tuck," and when the tuck is applied to the ostrich'e neck or head (his tender points) he is almost iuvariably eubdued, aud, after one or two efforts to escape, bolts furiously off to the other side of the camp, where he races up and down to vent his baffled rage. If, however, the bird gets near enongh to his oppoueut to give the so-called kick, he lifts his bouy leg as high as his body aud throws it forward with demoniac grotesqueness, and brings it down with terrible force. His object is to rip the euemy down with hie dangerous claw, but in most cases it is the flat bottom of his foot which strikes, aud the kick is daugerons as much from its sheer power as from its lacerating effects. It is a movement of terrible velocity and power, at all events. Several instauces may be meutioned of herd-boys being thus either wounded, maimed, or killed outright. One case occurred near Graaf Reiuet, in which a horse had hie back broken by a single blow. In this case the bird had eudeavored to kill the rider, but missed him and struck the horse.

Mauy persons have been set upon by birds when there was no shelter, not even a tree to ruu to. In such a case, if the pursued were acquainted with struthione tactics, he would lie down flat on the ground, where the birds find it impossible to strike him. But eveu this is no light matter, for some birds in their rage at beiug baffled of their kick, will roll over their prostrate enemy, bellowing with fury and trampling upon him in the most contemptuous fashion. One man who thus attempted the lying-dowu plau found that every time he attempted to rise the bird would return and stand sentry over him, till at last, after creepiug a distance, he got out only by swimmiug a pond that houuded one side of the camp.—*The Century.*

Mating Breeding Stock.

It is astonishing to us, as it is doubtless to anyoue who has beeu iu a position to observe, how many self-termed poultry fanciers there are who take no special pains in choosiug stock to mate.

If a cock is very alert, care shonld be taken to allow him hens enongh, so that he may not worry or injure them by too frequent attentions.

The male bird in very many cases exerts the most influence over the color of the plnmage and over the external points or marks iu geueral, while the heu governs most of the form, size and useful qualities of the progeny.

The poise of the body upon the feet should also be observed. If the habitual carriage appears as though the bird was balanced firmly but lightly in its tracks, then we will warrant that it is of symmetrical build all over.

Excessive leggiuess in the breeding stock is not to be tolerated, though in the cock it is not quite so objectionable as iu the hen, provided the mother of the cock was all right in this respect. And we remark, iu passing, that on all points too little is said or thought about the mother and the cock.

There is one feature in fowls, of uo matter what breed, always associated in our mind with general scragginess and coarseness, and that is a long back. We would not tolerate it either in cock or hen. Now, it often happens that in the breeds where great size is required a tall, elougated cock is chosen, simply because he pulls dowu the scales surprisingly. It is no wonder at all that he balances heavy weights, so long as bone is heavy stuff. Let us have squareness aud depth of body in all the heavy breeds, and width and rotundity of breast in most of the lighter ones. In this way there will be room afforded for the heart, lungs and other vital organs, which will insure vigor and stamina, and yet there need be no coarseness.

We cannot give full and detailed directions for mating, as different laws govern different varieties as to markings and the like. But the points we have noticed are important in the case of all breeds, and should be taken into acconnt when a breeding pen is made up.—*American Poultry World.*

Tested by Time. For Throat Diseases, Colds and Conghs, BROWN'S BRONCHIAL TROCHES have *proved* their efficacy by a test of many years. Price 25 cts.

Market Report.

FLOUR—We qnote: Best City Extra, $5 80@$5 85; Superfine, $5@$5 25; Interior Extra, $4 75@$5 37½; Interior Superfine, $3 75@$4 ₱ bbl.

WHEAT—There is a fair outside bnsiness being done. Shippers of large quantities are paying $1 82½ for No. 1 qualities, and this may be cousidered the top figure. Recent sales show the following figures: No. 1 white, August, $1 68; do. April, $1 86½; No. 2, white, April, $1 77 ₱ ctl.

BARLEY—The market is fairly steady. Recent sales, No. 1 feed, February, $1 12½@$1 12½; do. March, $1 14@$1 14½ ₱ ctl.

OATS—Fair Feed, $1 70@$1 75; Good, $1 75@$1 82½; Choice, $1 85@$1 95 ₱ ctl.

RYE—Business dnll. Qnotable at $1 65@$1 75 for fair to good.

FEED—Gronnd Barley, $27@28 ₱ ton; Cracked Corn, $35 ₱ ton; Shorts, $17@$19 ₱ ton; Oilcake meal the oilworks sell to the trade at $35 ₱ ton, less the usual disconnt; Middlings, $23@$24 ₱ ton for lots at the mill.

HAY—Alfalfa, $13 50@$15; Wheat, $15 50@$17 50 Wild Oat, $15@$17; Mixed, $11@$13 ₱ ton.

PROVISIONS—Eastern Hams, 18½@19½c; California Hams, 15½@16c for plain, 15½@16c for sugar-cured canvased; Eastern Breakfast Bacon, 15½@17c; California Smoked Bacon 14½@15c for heavy and medium, and 15½@16½c for light and extra light; Clear Sides, 15@15½c; Pork, $20@$21 for Extra Prime, $23 50@24 for Prime Mess, $25 50@26 for Mess, $26 50 for clear and $27@27 50 for extra Clear; Pigs' Feet, $16@$18 ₱ bbl; Mess beef, $15 for bbls and $8 50 for hf bbls; Extra Mess Beef, $17 for bbls and $8 75 for half bls; Family Beef, $18@18 50 ₱ bbl; California smoked Beef, 13½@14c ₱ lb.

FRUIT—We quote: Apples, 30@50c for common and 75c@$1 25 ₱ bx for good; Lemons, 8@$7 per box for Sicily; California Lemons, $2 50 per box; Limes, $9@$10 per box for Mexican; Bananas, $1 50@$3 ₱ bunch; Mexican Oranges, $20@$30 ₱ thonsand; California, $2@$4 per box; Pineapples, $8@$8 ₱ doz. New crop Western Cranberries are offering at $15@$17 ₱ bbl.

VEGETABLES—We qnote: Marrowfat Squash, $5@$8 ₱ ton; Carrots, 30@50c; Turnips, 75c@$1; Cauliflower, $1 50 ₱ dozen; Cabbage, 75c@$1 ₱ ctl; Garlic, 2@c ₱ lb; Celery, 50c ₱ doz; Dried Okra, 20@30c; Dry Peppers, 10@12½c ₱ lb; Green Peas, 5@8c Green Peppers, 8c per lb.

POTATOES—River Red, 70@85c; Early Rose, 75c@95; Tomales and Petaluma, $1@$1 10 ₱ ctl; Humboldt Red, $1 25@$1 27½; Kidney and Peachblow, $1 37½@$1 50 per ctl; New, 3c per lb.

ONIONS—For fair to choice, 50c@$1 is the range of prices.

BEANS—Bayos $4@$4 25; Butter, $3@$3 25 for small and $3 20@$3 30 for large; Lima, $3 25@$3 50; Pea, $3@$3 20; Pink, $3 50@$3 60; Red, $3 50@$3 50; small White, $3@$3 20; large White, $2 75@$3 ₱ ctl.

BUTTER—We quote jobbing lots: Fancy, 26½@27½c; choice, 25@25; fair to good, 23@24c; inferior lots from country stores, 15@19c; firkin, 23@25c for good to choice, and 20@22c for ordinary; pickled roll, 22½@24; Eastern, 18@22c ₱ lb.

CHEESE—Firm. California, 14@15c for choice: 11@13 for fair to good; do, factory, in boxes, 14@16c; Eastern, 16@17c.

EGGS—California, 37½@40c ₱ doz.

POULTRY—Live Turkeys, gobblers, 16@17c; do Hens, 15@17c; do dressed, 17@19c; Roosters, $6@$7 for old and $7@$7 50 for young; Hens $6@$7; Broilers, $6@$6 50, according to size; Ducks $11@$12 50 ₱ dozen; Geese, $2@$2 75 ₱ pair.

GAME—Supply and demand well balanced. Quail, 87½c@$1 ₱ doz; Mallard Ducks, $2 50@$2 75; Sprigs, $1 37½@$1 50; Canvasback, $2 50@$2 75; Brandt, $1 25@1 50; Gray Geese $2 50@$3; White Geese, $1 25@$1 50; Honkers, $4@$4 50; Snipe, $1 75@$2 for English and 50@75c for common; Teal, 75c@$1; Widgeon, $1@$1 25; Hare, $1 75@$2 25; Rabbits, $1 25@$1 75.

WOOL—But little change in price. We qnote fall: San Joaquin and coast, 8@12c; San Joaquin and coast Lamb, good, 9@11c; Northern Fall, free, 15@20c; Northern Fall, defective, 11@14c; Northern fall, Lamb, 15@19c; free Mountain, 11@15c. Eastern Oregon, 16@23c; Valley Oregon, 22@26c. We quote spring California ₱ lb 14@20c.

HIDES AND SKINS—Dry hides, usual selection, 18½@19c ₱ lb; culls one third less, and Mexican Hides 1c ₱ lb less. Dry Kip, 18½@19c; Dry Calf, 19@21c; Salted Steers, over 55 lbs, 11c ₱ lb; Steers and Cows, medium, 10c; light do, 9c; Salted Kip, 15 to 30 lbs. 11c; Salted Calf, 14@15c ₱ lb; Salted Veal, 12½@15c; Sheep Skins, 25@30c for Shearlings; 30@50c for short, 50@90c for medium, and $1@$1 35 apeice for long wool and wool skins. Butchertown Green Skins bring higher prices.

TALLOW—Qnotable at 8c@8½c ₱ lb for rendered and 11@12c for refined, both in shipping order.

MEATS—Following are rates for whole carcasses from slaughterers to dealers:

BEEF—Prime, 9@10c; medium grade, 7½@8c; inferior, 5½@6½c ₱ lb.

VEAL—Large Calves, 8@9c; small ones, 9@10c ₱ lb.

MUTTON—Wethers are qnotable at 5½@6c and Ewes at 5@5½c ₱ lb, according to quality.

LAMB—Quotable at 5½@7c ₱ lb.

PORK—Live Hogs, 5½@6¼c for hard and 5¾c@6¼ for soft; dressed do 9@9½c ₱ lb for hard grain hogs.

No. 20—Hurdle race; purse $200, of which $50 to second horse; entrance free; mile and repeat over four hurdles.

Entries to stakes and purses not marked closed, will close March 1, 1883.

Races to close will be run under weights adopted at annual meeting, 1881.

Starters in all races must be named at 5 p. m. the day preceding race, any other rule to the contrary notwithstanding.

Non-members will be placed on the same footing as members of the association in regard to the payment of purses and stakes advertised, and should there be a deficiency the winners will receive a pro-rata division.

Parties making nominations will be required to record colors at time of making entries, and after record will not be allowed to ride in other colors. This rule will be strictly enforced.

All nominations in stakes and entries in purses must be made on or before the first day of March next, 1883, directed to C. M. Chase, Assistant Secretary, Box 1961, P. O., San Francisco. To be valid they must be plainly postmarked on that day—March 1.

THEO. WINTERS, President,
JOS. CAIRN SIMPSON, Secretary,
C. M. CHASE, Assistant Secretary.

ANTEEO.

HORSEMEN, ATTENTION.

The Horse's Friend

Prof. W. H. Woodruff,

VETERINARY DENTIST,

LATE FROM BOSTON, CALLS THE ATTENtion of borsemen to the fact that there are hnndreds of horses in this city absolutely suffering from sore months and other complications directly caused by bad teeth, and they show this by the following bad habits:

Bit Lugging. Driving on one Rein, Balking. Bolting. Tossing the Head while Driving.

PULLING ON THE BIT,

Drooling and Foaming at the Month,

and other faults which can be corrected by dental manipulation. The Professor can be consulted at his office at the Fashion stables, 221 Ellis street. Office hours from 8 to 9:30 a.m., 1 to 2:30 and 6:30 to 7:30 p. m., Tuesdays excepted, when he will be at Thirteenth street stables in Oakland. Orders left at the Club stables, Taylor street, and the St. George, Bush street, or by mail, will receive prompt attention. Consultation and examination gratis.

N. B.—Particular attention paid to gents' drivers.

PAUL FRIEDHOFER,

☞ *PATHOLOGICAL HORSE-SHOER.*

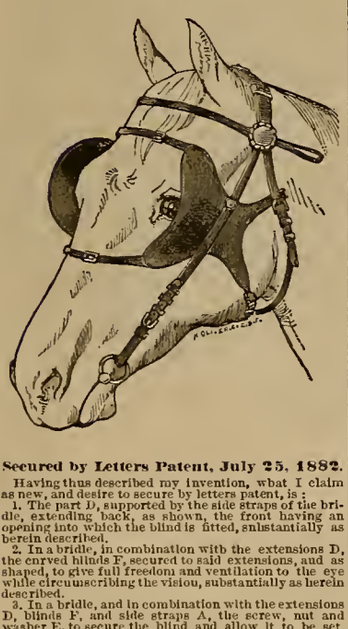
116 Washington Street.

PRACTICAL IN ALL ITS VARIOUS BRANCHES

IMPROVED

Blind Bridle & Winkers

FOR RACE HORSES.



Secured by Letters Patent, July 25, 1882.

Having thus described my invention, what I claim as new, and desire to secure by letters patent, is:

1. The part D, supported by the side straps of the bridle, extending back, as shown, the front having an opening into which the blind is fitted, substantially as herein described.

2. In a bridle, in combination with the extensions D, the curved blinds F, secured to said extensions, and as shaped, to give full freedom and ventilation to the eye while circumscribing the vision, substantially as herein described.

3. In a bridle, and in combination with the extensions D, blinds F, and side straps A, the screw, nut and washer E, to secure the blind and allow it to be set, substantially as herein described.

4. In a bridle, and in combination with the cheek-pieces D and blinds F, as shown, the straps or bands G and H, connecting the branches or extensions above and below the eyes, and having the adjusting slides or buckles, substantially as and for the purpose herein described.

5. In a bridle, and in combination with the blinds F, supported and pivoted to the bridle so as to be movable about the point of support, the adjustable front straps or bands G and H, and the rear band I and the throat-latch or lash connected with the blinds, and adjustable, substantially as herein described.

The above are the claims allowed by the patent office, and though the corresponding letters do not appear on the cut, the general principle will be understood.

It meets with universal approbation, doing away with all the objections urged against blinds, and at the same time giving complete control of the line of vision. By throwing the lower portion of the blind up something of the same effect on the action follows as is induced by toe-weights. This is especially the case when young colts are the pupils, teaching them to bend the knee without the strain of weights on the feet.

For bridles of all descriptions apply to

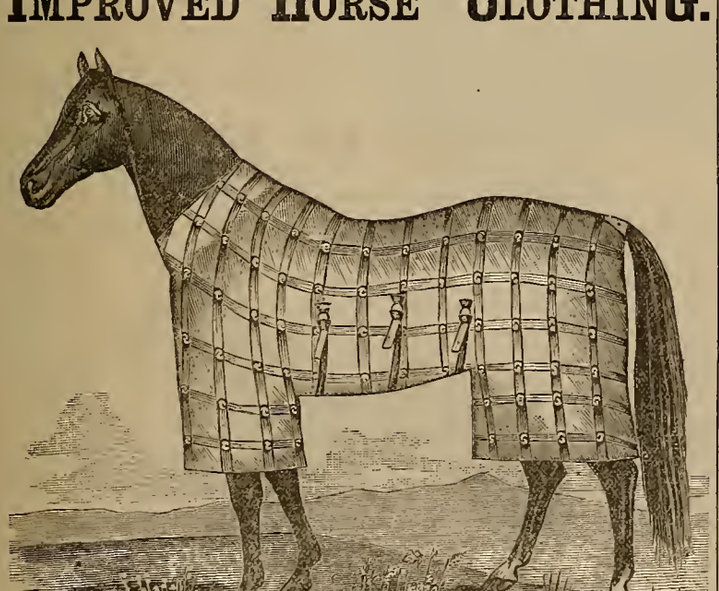
IMPROVED HORSE CLOTHING.



Secured by Letters Patent ISSUED MAY 27, 1879. REISSUED MAR. 29, 1881.

The above cut represents the body-piece, the patent also covering the improvements in the hood. The following are the claims granted:

1. An improved blanket or covering, consisting of the body-piece A, flap C, and the extension B, formed or united together, so as to cover the body and legs of the animal, substantially as herein described.

2. The blanket or covering A, having the flap C, and the extensions H, to fit the fore and hind legs of the animal, front fastenings F G, and the permanent straps or bands E, substantially as and for the purpose herein described.

3. The blanket or covering A, with its extensions B, permanent securing-bands E, and the front fastenings F G, in combination with the elastic neck-extension H, substantially as and for the purpose herein described.

4. The blanket A and hood J, in combination with the elastic connecting-strip I, substantially as described, and for the purpose set forth.

5. The close-fitting hood J, having the elastic band L beneath the jaws, so that they may be allowed to move without disturbing the fit, and adapted to be secured to the cover by means of straps, substantially as herein described.

6. The improvement in covering-blankets for animals, consisting of the blanket A, having the flap C and permanent straps or bands fixed to it to secure it around the body, whereby the use of loose surcingles is avoided, substantially as herein described.

The right to make clothing in the United States will be sold on a royalty. Apply to the patentee,

TO

Sportsmen & Pleasure-Seekers,

THE

SOUTHERN PACIFIC R. R. CO.

RESPECTFULLY CALLS ATTENTION TO THE

SUPERIOR FACILITIES

AFFORDED BY THEIR LINE FOR REACHING with speed and comfort the best places in the State for

Sea Bathing, Shooting and Fishing.

TRAINS LEAVE SAN FRANCISCO DAILY FOR

MONTEREY,

THE MOST CHARMING

Summer and Winter Resort of the Pacific Coast,

with its beautiful Groves and delightful Drives. Front in abundance can be obtained from the several streams in the vicinity of Monterey, and the best shooting may be had in season.

THE BAY OF MONTEREY

Is noted for the extent and variety of fish which abound in its waters, notably Salmon, Rock Cod, Barracuda, Pompino, Spanish Mackerel, and Flounder. The above-mentioned attractions, in connection with the low rates of fare, rapid transit, and the superior accommodations furnished at the "HOTEL DEL MONTE," have made Monterey a paradise for sportsmen.

THE BATHING ESTABLISHMENT

OF THE

"HOTEL DEL MONTE,"

IS UNSURPASSED.

A SPACIOUS SWIMMING TANK

(150 x 50 feet)

FOR WARM SALT WATER, PLUNGE AND SWIMMING BATHS.

ELEGANT ROOMS

For Individual Baths with DOUCHE and SHOWER facilities.

MAGNIFICENT BEACH

Of pure white sand for SURF BATHING, Etc., Etc.

THE FAVORITE ROUTE to those well-known Watering Places,

APTOS, SOQUEL AND SANTA CRUZ,

IS VIA THE

Southern Pacific Railroad,

(Broad Gauge), and the

SANTA CRUZ RAILROAD.

☞ At PAJARO, the SANTA CRUZ R. R. connects daily with Trains of the S. P. R. R.

The S. P. R. R. runs through the counties of San Mateo, Santa Clara, San Benito, Santa Cruz and Monterey, in each of which game abounds in great variety. Notably

Quail, Pigeon, Snipe, Duck, Geese, Deer and Bear.

Lakes PILARCITOS and SAN ANDREAS are reached by this line. Stages connect with trains daily at San Mateo for those well-known Retreats, PURISIMA, SAN GREGORIO and PESCADERO. We would particularly call attention to the unlimited extent of range at and about SAN BRUNO and McMAHON'S for RIFLE PRACTICE.

These resorts are but a short distance from San Francisco and offer special inducements to the lovers of this manly sport.

SPECIAL NOTICE.

Sportsmen and others presenting Passage Tickets o any description issued by this Company will be entitled to

FREE TRANSPORTATION OF THEIR DOGS

when carried in Baggage Cars and put in charge of Train Baggagemen. Train Baggagemen are instructed to issue CHECKS for all dogs received in Baggage Cars.

☞ In order to guard against accidents to Dogs while in transit, it is necessary that they be provided with COLLAR AND CHAIN. Guns and Fishing Tackle checked and carried free of charge. Guns taken apart and securely packed in wood or leather cases may be taken in Passenger Cars.

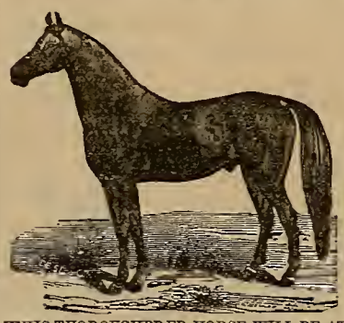
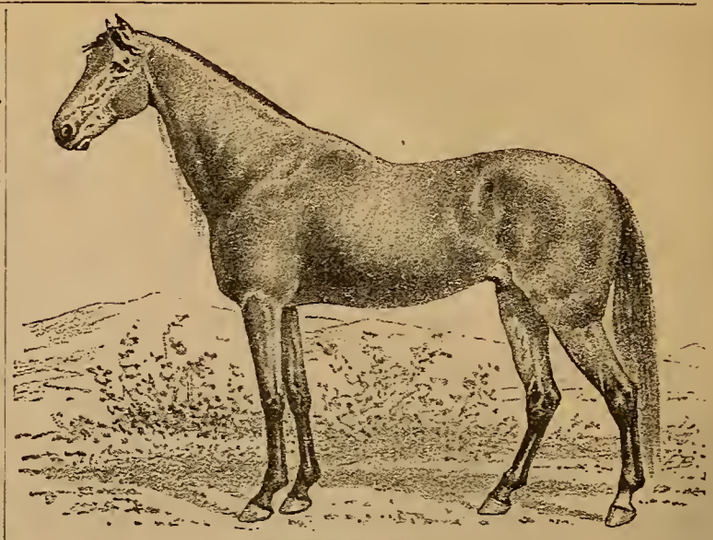
THAD STEVENS.



THIS THOROUGHBRED HORSE WILL BE AT Agricultural Park, Sacramento, for the season commencing Feb. 1 and ending the 1st of July next. Good pasturage for mares will be provided at $3 per month. For terms and particulars apply to or address
W. M. MURRY, Agent,
Sacramento Racetrack.



ALBERT W.

By Electioneer. His Dam Sister to Aurora by John Nelson.

WILL MAKE THE ENSUING SEASON, COMMENCING THE 15TH OF FEBRUARY, 1883, AND ending the 1st of July, 1883, at the Oakland Trotting Park.,

TERMS, $200 THE SEASON.

MONEY PAYABLE BEFORE THE MARE IS TAKEN AWAY. GOOD PASTURAGE AT $5 PER month. No responsibility for accidents or escapes.
No. 320 Sansome street, San Francisco, Cal. A. WALDSTEIN.

TROTTING STALLIONS
Singleton and La Harpe.

SINGLETON WILL MAKE THE COMING SEASON, FROM MARCH 1ST TO JULY 15TH, 1883, AT the farm of the owner, three miles north of Chico, Butte Co., Cal.

PEDIGREE.

Singleton is by Willie Schepper, a son of Rysdyk's Hambletonian, his dam Lightfoot (the dam of Pride) by Flaxtail, a son of Pruden's Blue Bull.

DESCRIPTION.

Singleton is a dark brown horse, tan flanks and muzzle, a little touch of white on hind feet and one fore foot, and star in forehead. He is 15¾ hands high and weighs 1,100 pounds. He was bred by Dr. M. W. Hicks, foaled spring of 1878.

TERMS.

Fifty dollars the season. Mares not proving in foal will be bred the following season free of charge. Mares from a distance will be pastured without charge during the season. Mares shipped to Chico, consigned to me, will be received by me on arrival of train, and taken to the ranch. Mares kept in any manner their owners desire, at reasonable rates. There is every convenience on the place, boxes, paddocks and plenty of shade and water.

LA HARPE

Will also make a short season at the above place on private terms. La Harpe is by Fame, a son of Alexander's Belmont, his dam Prairie Bird by Flaxtail, the dam of Flight and Prompter. Address

J. T. McINTOSH,
CHICO, CAL.

HAMBLETONIAN TROTTING STALLION
BOB MASON

By Echo. His Dam Belle Mason by Belmont, Thoroughbred.

Echo by Rysdyk's Hambletonian, his dam Fanny Felter by Magnolia (by American Star). Belle Mason by Belmont (Williamson's); First dam Lucy Johnson by the Pony (son of Imported Leviathan); second dam Catalpa, by Frank; third dam by John Richards.

WILL MAKE THE ENSUING SEASON, LIMITED TO TWENTY MARES, COMMENCING FEBruary 15, 1883, and ending June 15, 1883, at the stables of his owner, Figueroa street, Los Angeles.

Description.

BOB MASON is a mahogany bay, with inside of off hind ankle white and star in forehead; sixteen hands, and weighs 1,100 pounds. Foaled May 10, 1879. He is of fine, kindly disposition, a natural trotter, and has shown great speed, but as yet has no public record. For full history of his sire, Echo, see BREEDER AND SPORTSMAN July 29, 1882. See also, for his full brother, Exile, BREEDER AND SPORTSMAN, issue of September 16, 1882.

TERMS.

One hundred dollars the season, payable at time of service. All mares at risk of owners. Mares not proving in foal can be returned the following season free of charge. Address

CHARLES J. ELLIS,
Los Angeles.
Post Office Box 55.

MAMBRINO WILKES.

Black Stallion, sixteen hands in height, by George Wilkes, son of Rysdyk's Hambletonian, bred by B. J. Treacy of Fayette County, Kentucky. Dam Lady Christman by Todhunter's Mambrino or Idol, son of Mambrino Chief. Second dam by Pilot Jr. Third dam by Kentucky Whip. Idol's dam was thoroughbred and was by American Eclipse.

THIS IS THE LARGEST AND ONE OF THE BEST COLTS OF GEORGE WILKES (WEIGHING at this date 1,287 pounds) combining the Hambletonian and Mambrino strains and also several thoroughbred crosses. His colts demonstrate that he possesses in an eminent degree the same faculty of transmitting the family qualities to his offspring which put George Wilkes in the front rank as a sire of trotters.

Will make the ensuing season, beginning February 1st, 1883,

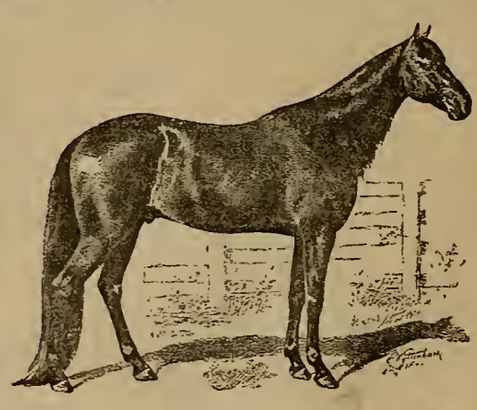
AT STOCKTON.

In putting the price by the season at the low figure of $40 the owner does not acknowledge, thereby, any inferiority on the part of this horse to any other sire of trotters.

IRVIN AYRES.

MAMBRINO TROTTING STALLION

Record at Six Years Old, 2:21½.



Record at Six Years Old, 2:21½.

ABBOTSFORD.

PEDIGREE.

BY WOODFORD MAMBRINO, HIS DAM COLUMBIA BY YOUNG COLUMBUS, WOODFORD Mambrino by Mambrino Chief, his dam Woodbine by Woodford, a thoroughbred son of Kosciusko.
Woodford Mambrino is recognized to be the best son of Mambrino Chief. His own record is 2:21½, and there are a large number of his get in the 2:30 list. Among them: Abbottsford, 2:21½; Convoy, 2:22½; Magenta, 2:21½; Lady McFatridge, 2:29; Dacia, 2:29½; George A. Ayer, 2:30.
Besides those having public records, he is the sire of the two celebrated mares owned by Robert Bonner—Maretta and Maltce. Maretta, with a running mate, and harnessed to a road wagon, trotted two miles in 4:27½, and Maltce trotted a trial, on the same track, a mile in 2:19¾. Woodford Mambrino is also the sire of Princeps, the sire of Trinket; record, 2:14. Woodbine is also the dam of Wedgewood, record, 2:19. Young Columbus, the sire of the dam of Abbottsford, has nine of his get in the 2:30 list, so that on both sides of the house there are notable performers. Abbotsford is a rich rosewood brown, 15½ hands, and of very high form. His get are very promising, his daughter Jasmine having won the Embryo Stake for yearlings in 1881, and every one which has been put in training has shown good speed.

TERMS.

Seventy-five dollars the season, to be paid before removing the animal. Mares not proving in foal can be returned the following season free of charge. Good pasturage at reasonable rates, and extra pains taken, but no liability for accidents or escapes.

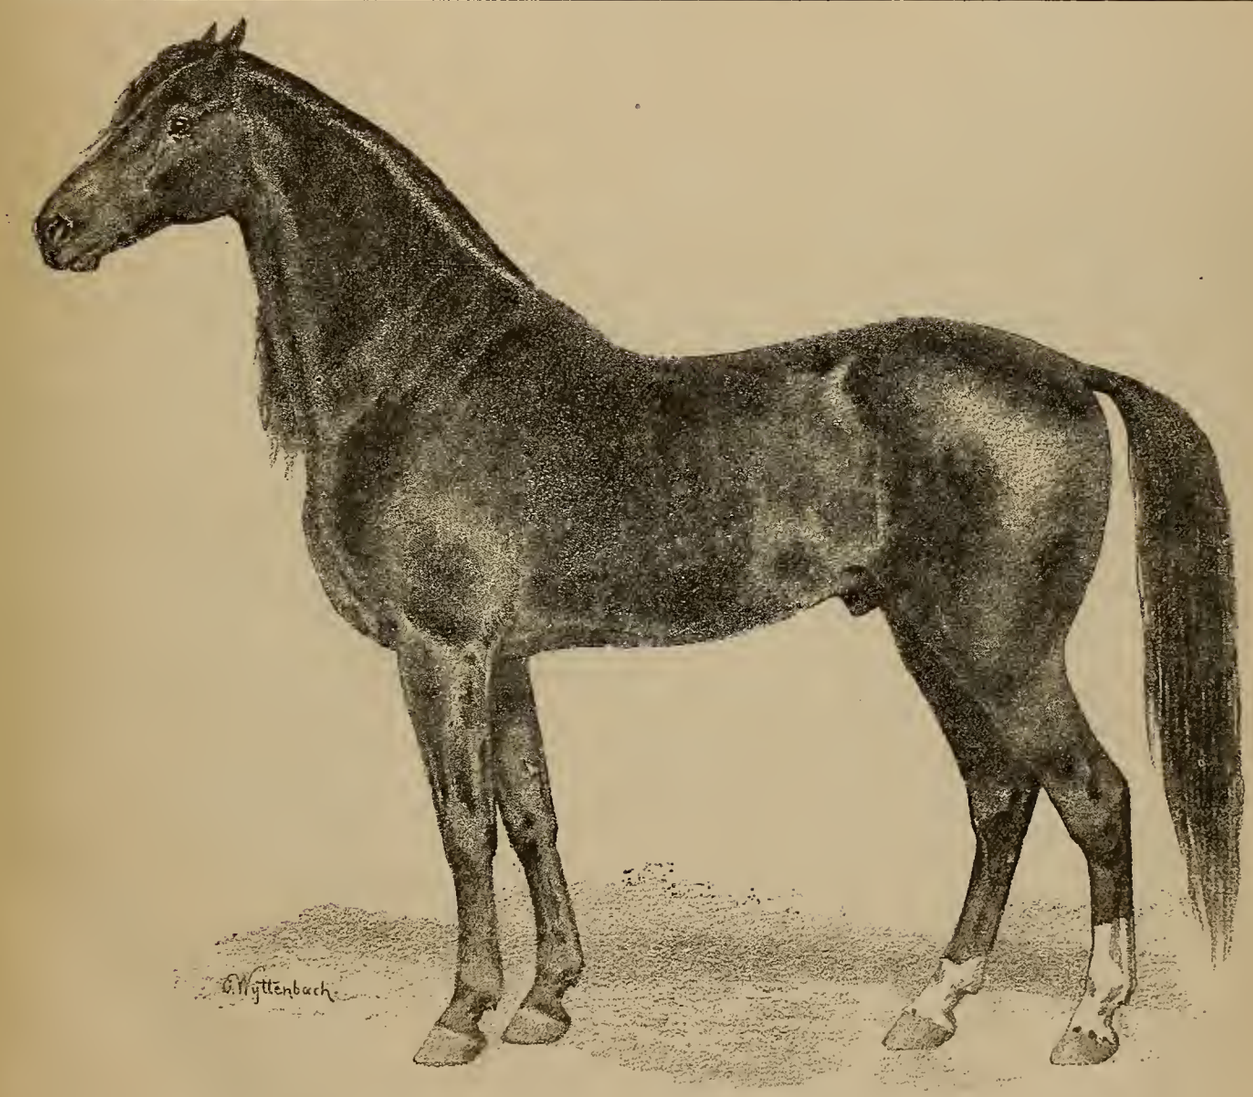
LOCATION.

Abbotsford will make the ensuing season, 1883, on the ranch of S. B. Whipple, Esq., San Mateo, season commencing February 15th and ending June 1st, 1883. For full history see the issue of BREEDER AND SPORTSMAN of August 5th, 1882.

GEORGE BAYLIS, Agent, San Mateo, Cal.

BREEDER AND SPORTSMAN

Vol. II. No. 5.
NO 508 MONTGOMERY STREET. SAN FRANCISCO, SATURDAY, FEBRUARY 3, 1883. SUBSCRIPTION FIVE DOLLARS A YEAR.



ALTOONA—By Almont, his dam Theresa B By Prophet Jr. Owned by A. H. HECOX, San Luis Obispo.

Again we present a son of the great sire of Fairlawn, and it is almost unnecesesary to state that the likeness is a faithful representation, as all that have heen puhlished in the BREEDER AND SPORTSMAN are recognized as true to nature as it is possible to make them. There are points that cannot he reprodnced in a picture, and an engraving does not give the color. But we will only state that Altoona is a dark hay, stands over 15¾ hands, "lengthy," with the hest of legs, fine mane and tail, and more than usnally muscular. His disposition is as good as can he desired. Docile and yet spirited, an admirable road horse, and with a flight of speed that insnres him making a faet trotter whenever the opportnnity is given him to practice. He hae the action of the Almonts, which is praise enough to those who are acqnainted with this justly celebrated hreed of horses.

Altoona was hred hy General W. T. Withers at Fairlawn Stock Farm, Lexington, Ky., and was sold hy him when a yearling. He was taken to the lower conntry soon after his arrival in California, where there wae no chance to develop his speed. He was hrought to Oakland, the intention of his owner heing to have him trained, hnt upon reconsideration he resolved to postpone the echooling for a time, and shipped him home a couple of weeks ago. When ehown at the faire he has heen euccessfnl, taking the first preminm for roadster stallione and also the sweepstakee at Salinas.

In order to give a compreheneive statement of the Almonts, we copy from General Wm. T. Withere' annnal catalogue for 1883 a full acconnt to date. In thie connection it is proper to say that althongh General Withers ie the owner of Almont, and an euthnsiastic advocate, he ie also candid in his statements; a little prone, perhaps, to arrange the "tablee" to snstain his viewe, he can be depended npon for the accuracy of what he promulgates as facts. A person who could own such a horse as Almont and not be enthusiastic has no right to he engaged in the husiness of hreeding horses. An individual of that stamp wonld regard the colts as repreeenting so many dollars, jnst the same ae if he were huildiug wheelbarrows which he could eell at a round profit.

It is a waste of space to add anything to Geueral Withers' complete description, and graphically written, though Altoona has other claime to distinction than that ohtained from the paternal line. His dam is also owned at Fairview, and the following is her pedigree:

THERESA B, chestnut mare, with some white on all her feet, and white mark in face, 15½ hands high, foaled in 1867. Bred hy James Blackburn, Esq., of Woodford county, Ky. By Prophet Jr., son of Prophet, eon of Hill's Vermont Black Hawk.

First dam Mollie Floyd (dam of Bolly Lewis, record 2:29½; Princess and Gazelle), by Mohawk.

Second dam hy Davy Crockett, a Canadian pacer.

Third dam Pues, a fine road mare imported from Canada.

The Vermont Black Hawke are a potent force on the trotting tracks, and so well known that there is little necessity

(CONCLUDED OF PAGE 68.)

THE STABLE.

The Perfect Foot.

The history of Anteeo was carried in the preceding chapter until February 23, 1882, when within seventy days of three years old, and a resume to the present date, February 1, 1883, will show how the tips have answered in his case. It will be tiresome to enter into the history as minutely as I could give it, as everything in relation to his showing and work has been noted in the daily journal.

His case has probably elicited more discussion, or rather more adverse comments on the method he was shod, than will ever occur again. He was brought prominently before the public from being engaged in some important stakes, and all his shortcomings charged to the tips. Had it been otherwise than that I was thoroughly imbued, and obstinately confident of the correctness of the principle, I would have surrendered to the universal clamor. Having the "courage of conviction" I was not to be moved by arguments, ridicule or the conjectures of people, many of them being as ignorant of what they talked so learnedly about as if they had never seen a horse. Others had strong arguments, that is when the guide is previous opinions. Not one of them had tested the difference between shoes and tips, and, consequently, their reasoning was purely theoretical. It is also true that on my part I could not say authoritatively that Anteeo would not trot faster with full shoes, as that was something he had never worn on his fore feet, but from all those that I had tried the change upon trotting faster with tips than when wearing shoes, the inference was that he would not be an exception. The objectors who presented the most logical reasoning based their arguments upon his action.

He has very little "action," when that term is used to express bending of the knee and hock. He is rather a "short strider," and when going at 3:30 gait is prone to hitch, sidle about, swing from one side to another, and to a person who only saw him when jogging he would convey the impression that he was of no earthly account as a fast trotter. When going fast he moves as squarely as it is possible for a horse to trot; and the only thing I would care to remedy is the shortness of stride. It certainly appeared reasonable to expect that more weight on the front feet would remedy this, and it also seemed that a toe-weight would be beneficial. I tried weights on different occasions, and he would not trot so well, excepting in one instance which will be given hereafter. In order to fully understand his case it will be necessary for me to recite other peculiarities. He was foaled where I reside in Oakland, and I have the use of about an acre lot. He and his dam occupied the lot without other company. The colored boy alluded to before was continually petting him, and so much did he think of the colt, that he would permit him to bite and play without correction. Before he was weaned it was unsafe to go into the lot without a whip or stick to keep him off.

It was not much trouble to break him to harness, though from the first he was stubborn, and severe punishment made him more determined in his obstinacy.

This was partly inherited, partly the result of familiarity between him and the boy when a foal. The inheritance came from Bonnie Scotland who the English writers say was the most sluggish horse in his exercise ever trained in England. I owned two colts by Bonnie Scotland which had the same disposition. They were brothers, and the elder was completely spoiled by severity; the younger, who was treated with invariable kindness, outgrew the obstinacy and became free and pleasant. The elder was one of the fastest horses I ever saw, running a quarter of a mile in twenty-three seconds in his training shoes and with his weight up, and apparently could go any distance. Severe punishment resulted in utter worthlessness either to run or drive, as when broken to harness it was impossible to drive him away from home at any other pace than a slow walk, although when turned to come back he would trot at a three-minute clip. If whipped going away from home he would stop. If given a sharp blow as he was coming back he would kick with terrific vengeance. From that experience I knew that it would not answer to punish Anteeo, and though there was a perfect deluge of advice, the general purport of which was severity to the pitch of cruelty, I treated it the same as that to replace the tips with shoes, and kept my own course. That this has been correct is apparent, as in the last few weeks he has taken an inclination to go, and I have the fullest confidence that hereafter there will be no more trouble with him on that score.

It is necessary to be made acquainted with this peculiarity of temperament in order to understand fully why he would show at times a flight of speed, and then in his races and at other periods not trot within ten seconds as fast. That presented in so brief a manner, I will take up the discourse from the time Mr. J. watched the setting of the tips. He was not driven from early in November, 1881, to January 28, 1882, and then only occasionally to a heavy breaking cart, generally on the road. Until May 25th he was driven to a lighter cart, part of the time on the track, with fast work once in a while. The lighter cart will probably weigh 130 pounds or more, having elliptic springs and being strong enough to carry two men. On the 25th of May he was hitched to a sulky the first time since he trotted in the Embryo the November before. The tips had varied in weight from three ounces, those that were worn, to seven ounces, the heaviest I had made; usually five ounces or six were the weight of those used.

In the mean time I tried a different shoe on the hind foot, a description of which will be given in the appendix.

On the 31st of May I commenced galloping X X with him, in order to encourage him to go along without so much urging, and from that time his fast work was in company with the galloper. June 7th commenced working him "two and two," finding that he was more inclined to trot the second mile than the first. This kind of work was kept up, and on June 15th, "on the repeat," he trotted the two miles in 5:20—the last mile in 2:38. On June 27th gave him three heats of two miles, the last mile of each being 2:40, 2:39½, 2:38½. The first mile of each heat I drove him as fast as I could, but 2:41 was the fastest, and that in the third heat. Being so busy on account of the work incidental to the start of the BREEDER AND SPORTSMAN, I did not drive him again until the 17th of July, his only work being jogging to the cart by the man who took care of him. July 27th I put new tips on him weighing six ounces each, and on the 29th is the following entry in the journal: "Jogged Anteeo three miles to cart, hitched him to sulky and then gave him three miles at a good pace, moving in places fast. Scraped and repeated him two miles in 5:25, moving through two stretches in 37 seconds each. After the work he played coming home." On the 1st of August he finished a strong drive of three miles by trotting the home stretch in 37 seconds, which proved that the work three days before had not been detrimental. On the 3d of August he was attacked with the "pinkeye." This disease practically laid him up until Sept. 16, although he worked occasionally, which I am satisfied was an error. The sickness prevented him trotting in the Occident Stake at the State Fair. On the 26th of September we resumed the two-mile work endeavoring to prepare him for the Stanford Stake. The swelling between his jaws suppurated and broke a few days before that race was trotted.

In the race when "warming up," after going at a good pace, he trotted half a mile in 1:16½ and a quarter in 36½ seconds, and yet he was beaten in 2:34½ 2:36½, 2:40 2:38. The cause of this I will endeavor to explain after a few more illustrations. The Stanford Stake was trotted the 21st of October on the Bay District Course; on the 25th he was brought home, and on the Oakland track I gave him three heats of two miles in the last of which he trotted the second mile in 2:36½.

On the 30th I drove him three heats of a mile as fast as I could, scraping him between the heats. After this I gave him a heat of two miles and he trotted the last mile in 2:30½. The fastest first mile I could drive him up to this time was 2:39½. He made a poor showing in the Embryo Stake, but on Nov. 26 the following is the record in the journal: "In the afternoon I drove Anteeo. Jogged to track and two miles on it to the cart. Hitched him to the sulky, X X galloping to another. Went two rounds of the track the reverse way, the last at a good rate, then turned and gave him a mile in 2:45. Slight scrape and repeated him in 2:41. Again scraped lightly, and after scoring a few times, drove him a mile, with a break soon after starting, in 2:35. Keeping on, the timers, James Garland, Geo. Palmer and Johnson, timed from the quarter pole, the last three-quarters in 1:54, and as the first quarter was as fast as the others that mile was probably made in 2:32." On December 5 he trotted the last mile of the third heat in 2:34½. One more illustration will be sufficient. After strong work from the 4th until the 12th I determined to again try him with toe-weights; though on previous occasions he did not trot as well. November 21st three-quarter shoes were put on his hind feet, at that time weighing seven ounces, and on the 4th of December I put on tips of five ounces each. By the 12th the hind three-quarter shoes would not weigh over five ounces, as when pulled off a short time afterwards they were reduced to three and a half ounces. He was thus rigged: Ordinary walking or ankle boots all around. Quarter boots weighing 4¾ ounces each on his fore feet and toe-weights of 3¾ ounces each. Thus there were about thirteen ounces on each forefoot, allowing for the eight-days' wear in the tip. Contrary to the previous custom he was driven alone. Walked to the track, nearly one mile, harnessed to the sulky, jogged two miles, the reverse way, moved up the homestretch, around the turn and half way down the homestretch. When turned he seemed to want to trot; none of his usual stubbornness or mean actions. He made the first quarter in 38½ seconds, went to the half mile in 1:15¾ and the mile in 2:31½. I never drove him a mile so easily, never touching him with the whip or moving the bit in his mouth. On the 8th I drove him three heats, the slowest in 2:42, and on the 9th he was worked sharply for three miles, and trotted a heat against Bonnie and Fred Arnold.

The opponents of tips have laid great stress on the trotting of Anteeo, and I have given this long, and, it may be considered, tedious account, in order that there may be a proper understanding of the case. In the first place for a colt foaled May 5, 1879, and with so disjointed a schooling as the record shows, it may be considered a very fair rate of speed. To take the maximum, 2:30½, and it is more than a fair showing for a three-year-old if even the education had been better managed. Had the tips been so detrimental as is claimed, so diametrically opposed to speed, there never would have been a display, and slow time would have been shown at every trial.

There could not be soreness, as the harder Anteeo worked the faster he trotted. Intervals of rest invariably added many seconds to the mile, and fast quarters, halves and miles were made at the finish of long heats. And now for the explanation of the erratic exhibition, and the causes why the second mile would be faster than the first, and the greater the number of the heats the greater the increase in the speed. When fresh he wanted to rebel. In that situation he was determined to resist the attempts to urge him to more rapid movements, and anything like severe castigation resulted in a still stronger will to thwart the driver. When he became wearied, not so tired as to prevent him from trotting, the obstinacy gave way, and then he was willing to go along. When he trotted the half-mile in 1:16½ at the Bay District he had been driven two miles as fast as I could work him along, and if it had been permissible to move once around the track, and then get the word, he would have made a good performance. The mile in 2:31½ on the 12th of December, so contrary to all his previous actions, I ascribe to the weights distracting his attention at that time, when in the prior failures the same effect did not follow. Then there is a manifest improvement in his disposition of which that may have been the forerunner. He has become more docile in the stable, or more properly not so mischievous. Heretofore he seemed to have an idea that men were playmates; that it was all right to jump on them, give them a nip or run against them just as a colt is likely to play with another. Until the last few months he could not be led in hand without constant threatening him with a whip, and so I fixed a strong piece of bamboo with a snap in the end of it to keep him off. When in his box he had the same inclination, not a particle vicious, as his countenance would indicate good nature, but ready for a frolic at every opportunity. The bamboo had to be used to snap into his halter ring, and the halter I fixed so that the bridle could be put on and the halter could be removed afterwards. This was effected by a buckle on the nose-band, and it also gave the opportunity to replace it before the bridle was removed. Without this precaution he would try to catch the person bridling him by the foreleg exactly similar to the action of a colt when playing with another. This mischievousness doubtless came from the plays with the boy when a suckling, and the endeavor to remedy it by such severity as people advised would have resulted in confirmed vice.

At the present time he is as sedate as need be. Comes to the call of his attendant in the stable, and will walk as decorously as a quiet mare. That there is a change as well in his disposition as in other respects is apparent, and I feel quite confident that he is a different animal in still more important respects. I drove him December 15, and from that time he has been exercised on the road by his groom. On the 18th of this month, January, 1883, I put tips on him weighing three ounces each, his hind feet bare. On the 21st, 22d and 23d I drove him to the track in the light cart, having put the 3¾ ounce toe-weights and quarter boots on him, and for the first time in his history I could move him through the stretch after jogging him a couple of miles. He not only would go through the stretch, but after being stopped and turned around, he would strike a fast gait in a few strides, and I feel confident that he never trotted faster. Should this favorable conduct be a permanent regeneration I have the utmost confidence in Anteeo proving that tips can be carried fast at a trotting gait. Everyone who sees him admits that his legs and feet could not be in better condition, and that this is owing to his foot never having been hampered with a shoe I implicitly believe.

While the history of Antevolo, brother to Anteeo, has not so direct a bearing on the question of shoeing as that of the older, there is still a lesson that is proper to repeat in connection with the other illustrations. Antevolo was foaled on May 12, 1881, his birth-place being the celebrated breeding farm, Palo Alto. He came all right, and the first time I saw him, May 29th, I considered that he was as good-looking and as well-formed colt as I had ever seen in a trotting-bred one. He ran with his dam on the foothills, and was so full of life and play that he was continually galloping.

There being a good deal of gravel and hard ground he wore his feet away, the near one being so badly broken that the toe and part of the sole were worn entirely away. The foot was so sore that he could not touch it to the ground, and he either went on three legs, or walked on the front part of the ankle joint. It appeared as though it would be an act of mercy to kill him, but Frank Covey, knowing how highly he was valued, gave him every attention.

There was quite an improvement though when he was brought home, December 21, 1881, it was the opinion of every one who saw him that he would be entirely worthless for anything but a stock horse.

The foot had certainly a bad appearance. The horse in place of having a natural angle at the toe from the coronet inclined in the wrong direction, so that the toe was nearly on a straight line with the cannon bone. Though the heel was very high it did not touch the ground, and there was an enlargement above the coronet like a ringbone, excepting that it was restricted to the front. The day after he came home I cut the horn away at the heel until it was no higher than the frog, and when clearing away the horn at the toe which was turned under, overlapping the sole, the blood poured out in a stream, and I then discovered that for a space of at least two inches there was a gap half an inch in width between the sole and the wall. In outward appearance there was very little resemblance to a natural foot. The toe was straight across without any curvature and the wall on each side where it came to the ground was also straight. At the coronet the heel was abnormally wide.

When the foot was pared I drew the outline of it by holding a piece of pasteboard against the sole as he could not stand on it, and when returned to his stall he limped back on the other legs, holding that one up.

My intention was to make a tip that would project as much at the toe as would make the bearing the same as if the foot were natural, but after seeing the state of his foot, I came to the conclusion that it would not do to attempt putting anything on it that required nailing. I made a boot something like a "soaking boot," but I did not use it, restricting the attention to keeping the foot clean. On the 5th of January I applied the biniodide of mercury preparation to the coronet. The 14th

of January I again cut away the horn at the bed, and turned him in the small lot for an hour or two, and this was continued daily until the 26th when I repeated the blister. This treatment was continued, and it was apparent that the blister was not only reducing the enlargement but also stimulating the growth of the horn. By the 29th of March there was such a decided improvement that I concluded to commence his education and led him by the side of X X, and the entry in the journal at that date is: "He astonished me at his readiness, the first time he was ever led by the side of a horse, and at the trotting gait he exhibited. He is a trotter surely." I led him three times, but fearing that it was too soon to take chances of the foot becoming sore again he ran in the lot part of the time until the 15th of May, when the harness was put on him, and after becoming accustomed to it, by wearing in his stable for some days, he was driven about without any vehicle. On the 24th of May he was hitched to the breaking cart, and on June 5 he was driven to the track for the first time, and on the 8th he trotted quarters in 59 and 59½ seconds. On the 11th of June he was fourteen hands and half an inch high; on the 14th he trotted a quarter in 54 seconds; the 26th he made the same distance in 50 seconds. There is no necessity for giving his work and performances in detail, further than to state that he also had the pinkeye, which threw him out for a time, and owing to the same causes as prevented me from driving Anteeo, he was still more neglected. At the Golden Gate Fair he won the purse for yearlings, trotting in 3:07, and in the Embryo he was second to Dawn, trotting in 3:02, the time of the winner 2:59. Since then I have driven him quarters in 42½ and 43 seconds, a half mile in 1:28, and in all these instances he was barefooted. I felt that he might trot faster with tips on his front feet, and at one time thought that I would be compelled to put on three-quarter shoes behind as he was inclined to strike the coronet and needed the protection of "scalping boots." I found a method, however, of fastening these, at times, necessary adjuncts, and I was loth to change the treatment which had proved to be so beneficial. The ailing foot is now nearly as perfect as the other, and I have the utmost confidence that in another year it will be entirely right. All that it lacks is a trifle of the roundness of its mate, and few who are not aware of the previous ailment notice the difference.

But the rainy weather compelled driving on the macadamized streets, and there being some wear at the toe two weeks ago, January 13, I put tips on weighing three ounces each. The next day I drove him on the track and I thought he showed a forty gait, though the sharp edge of the tips wounded the hind pastern above where the scalping boot came, and after that he was inclined to hitch. A "speedy cut" attachment remedied that, but again the rain came, and I have not driven him since. The *Turf, Field and Farm*, commenting on the use of tips, and referring to me driving Antevolo barefooted, asked the questions which follow:

"From this (a statement of the trotting of Antevolo) it will be seen that notwithstanding his advocacy of tips, Mr. Simpson trotted his own colt on at least two occasions 'barefooted' and 'without shoes, tips or weights.' Has he, too, found that tips will not answer? If not, why did he not use them on the occasions referred to?"

These questions are answered by the short history, though if nothing had been the matter with the feet the experiment was worth trying, and if there had been soft roads to drive upon I would have carried it further. I have not the least doubt that Antevolo would have been capable of beating 2:40 in his two-year-old form if still kept barefooted, and with a very good chance to trot a good deal faster than that. While I claim a decided superiority for tips over the full shoe, I am not prepared to say that the foot can be kept as perfect as when without anything upon it. Still, however, as tips are the nearest approach to a barefooted condition, the benefits of the latter can be rendered available as nearly as the duties of domestication will permit. Therefore, the success of this barefooted colt is additional proof that "tips will answer?"

Before leaving the history of these two colts I may be pardoned for diverging from the subject under consideration to call attention to the "glorious uncertainty" attending the breeding of horses. These two brothers are in many respects entirely different. In form the elder is immensely powerful all over. Quarters, gaskins, loins, shoulders and arms are covered with masses of muscle, and bone and tendons are in proportion. His legs are short, and he stands squarely upon them at all times. He is almost a fac simile of his sire, though his head and neck are larger, and he has rather more length. He is a trifle over 15½ hands, still growing, and when mature will probably be an inch taller. The younger has more quality, "rangier," head and neck as fine as a thoroughbred, lighter limbs and smaller feet. He is 15½ hands now, at least two inches taller than his brother at the same age, and he has grown 4½ inches since the 11th of June, and is likely to be 16 hands before the 1st of January next, and while he still ranks as a two-year-old. This growth also proves that the work was not a drawback. The younger has more knee action and a longer stride. But the greatest difference is in the disposition. That of Antevolo could not be improved. There is not a point I would care to change; he is as "level-headed" as an old campaigner, and nothing throws him off his balance. The Berkeley railway runs within a few feet of the Northern turn of the Oakland track. In the Embryo trot the train was met when at the nearest point. Dawn made a few jumps and I must acknowledge that I was in hopes he would act badly so that I could pass him. Antevolo looked at it for a second and kept trotting his best, never leaving his feet for the whole mile. He is free and full of spirit, a chirrup sending him along while a word will restrain. He is a model roadhorse, never shies, and goes with the vim of an old horse. He reminds me of his grandsire, A. W. Richmond, and still more of his great grandsire, old Blackhird. The mischievousness of Anteeo undoubtedly resulted from the petting when a colt, and this may have led to his stubbornness as well. Still as it was a trait of Bonnie Scotland, and, as I have shown, of some of his colts, it is likely that there was an inherited tendency in that direction which might have remained latent under better management. The maternal grandam of these colts was Columbia by Bonnie Scotland and she was a granddaughter of Fashion. Thus the thorough predominates on that side of the house, and their action is that of the thoroughbred. As one has done fairly well with tips, the other still better barefooted, the inference is just that weight is not necessary for that kind of a gait, notwithstanding that such is the general opinion of experts.—*Advance Sheets "Tips and Toe-Weights."*

TURF AND TRACK.

Horses and Horse-Racing in Olden Times.

The earliest allusion to the horse is where Anah, a contemporary of Isaac (about 1590 B. C.) is said to have found mules in the wilderness, the progeny of the ass and the horse. Later on, about 1500 B. C., horses were used for purposes of war, and it is only natural to imagine that the domestication of this animal was coeval with the establishment of civilization, and more than likely Egypt was the first country in which this occurred. We read that on Cæsar's landing in Britain, the Roman troops were opposed by immense bodies of horsemen—a strong proof that civilization had made greater advances among the ancient Britons than some historians would have us suppose. The date at which the improvement in the breed of horses began to be systematically pursued in Great Britain may, however, be written as the year 1616, when James I gave 500 guineas for an Arabian entire horse, which was named "The Markham Arabian," having been purchsed from a Mr. Markham, a merchant trading with Arabia. A prejudice set in against this Arabian, as he was not successful as a racer; but this eventually disappeared, for in the next century, during the reign of Queen Anne, we find "The Darley Arabian," imported by a Mr. Darley from Aleppo. This horse was bred in the desert of Palmyra, and it is said that his progeny were unequaled for beauty, speed and strength. The Darley Arabian is often termed the Father of the Turf, and, indeed, the history of the turf may be said to begin from his time. Next we have the Godolphin Arabian, which was imported by Lord Godolphin. It is said, however, that this horse was wrongly described as an Arabian, and that he was really a Barb, imported from Barbary. He lived to be 29 years old, and died in 1753. Previous to the time when special care began to be taken in the selection of sire and dam, it was the custom to turn horses out to graze over the commons of England, and it was made law (32 Henry VIII, c. 13), "That no person shall put on any forest, chase, moor, heath, common, or waste any stoned horse above the age of two years not being fifteen hands high;" thus showing that height was thought an essential requisite for sires in those days. During the last two hundred years the pursuit of horse-racing has been more attractive to the leading families of England than any other outdoor pastime. Horse-racing as a public sport may be said to have commenced in the reign of James I, the races then run being purely for amusement; but it is recorded that so early as the time of Henry II races were run in Smithfield for the purpose of selling the horse that got the best of the struggle. In some parts of England horse-racing was commonly practiced at Easter time, and at the end of the seventeenth century it was prohibited, as being "contrary to the holiness of the season." In 1740 horse-racing had become so prevalent throughout the country that a law was passed by Parliament to restrain it, and it was enacted that after the 24th of June, 1740, no plate should be run for of less value than £50, the penalty for transgression of the law being £200. Parliament further settled the weights to be carried in all races, as follows:—5 years old, 10 stone; 6 years old, 11 stone; 7 years old and aged, 12 stone.

It is possible to obtain but few of the performances of the horses during the early part of the 18th century. The published records date from 1718, and the races were generally matches, and in long courses varying from four to twelve miles in length. In the year just mentioned 23 matches were decided on Newmarket heath, in all but one of which the distance was four miles. In 1719 the Duke of Wharton made two matches of six miles each, and in the same year a "Royal Cup," value 100 guineas, was given by George I for five-year-old mares, 10st. each, distance four miles, which was won by the Duke of Rutland's Bonny Black, by Black Hearty, son of Byerly Turk. In this race 31 started, and no less than 16 were placed by the judge. In the next year the "Royal Cup" was again given; 18 started, and Bonny Black again won. In 1720, 26 matches were run, and in the month of October in that year the Duke of Wharton's Coneyskins, 11st. 10 lb., beat Lord Hillsborough's Speedwell, 12st., the best of three heats, 12 miles, for 1,000 guineas, thus showing that racing in those days was more for endurance and staying powers than for speed. For a few years only about that time are there any records of the racing that took place, and not until the latter part of the last century do we find any regular record kept. In those early days of racing "Give and Take Plates" were both common and popular, with conditions as follows: The horses entered carried weight for age and weight for inches, each horse being measured under a standard before starting. Aged horses and mares, 13 hands high, carried 7st., and for every additional one-eighth of an inch 14 ounces extra. Six-year-olds carried 4lbs. and five-year-olds 12lbs. less; thus, if a horse stood 14 hands high, he carried 9st.; 15 hands, 11st.; and so on in the same proportion. The following is a correct return of a Give and Take Plate, run over the Knavesmire, at York, on August 21, 1753:

A plate of £50 for horses, etc., "Give and Take," 14 hands, aged, 9st., 4 mile heats.

Mr. Hudson's br m Pickering Molly, by a son of Smiling Ball, 13 hands 2 inches, 8st	1 1
Lord Rockingham's ch h Silverleg, by Young Cartouch, 13 hands 3¾ inches, 8st. 8lb. 12oz	3 2
Sir J. L. Kaye's b g Adam, by Young Cartouch, 13 hands 3 inches, 8 st. 7lb	2 drawn

From about the end of the last century dates the flourishing period of horse racing, which has been annually increased by the ever-growing interest taken in it by all classes of society. In 1752 there were 60 thoroughbred stallions standing in various parts of England. The fees were then very moderate. Oronootes headed the list at 20 guineas, Bolton Starling was next at eight guineas, while others varied at from one to three guineas. Eight of these horses were reputed imported Arabians, and it is owing to these well-selected Arabian and Barbary horses, crossed with the best British mares, that England now reigns supreme in the production of the best breed of horses in the world.—*Federal Australian.*

A Trainer Obtains a Verdict for False Imprisonment.—During last summer Dugald J. Bannatyne, who owns several racehorses, made two or three complaints before Justice Edwards, of Eatontown, N. J., and Squire Childs, of Red Bank, N. J., charging William Pryor, a well-known trainer, with embezzling large sums of money from him. Pryor was held on one charge and discharged by Squire Childs upon the other, when he demanded a hearing. At the hearing Bannatyne said he was a Scotch lawyer, and asked to be allowed to act as his own counsel. He failed to prove embezzlement or any offense, and Pryor was not indicted by the Grand Jury upon the first charge. Lately Pryor brought suit for damages against Bannatyne, charging him with malicious prosecution and false imprisonment. The defense consisted of an effort to show that Pryor, while employed as trainer for Bannatyne, had misappropriated funds given him to pay bills with. The jury gave a verdict in favor of Pryor for $1,000.

Oregon Horses.

Dear Breeder and Sportsman: Having more leisure than anything else at the present time in this rainy country, I will jot down a few items under the above head, and anything else that may occur to me as I go along that I think will be of interest to some of the readers of the Breeder and Sportsman. I will first speak of a dead horse, that has left a great many of his offspring in this part of the State; and I predict that some of them will one of these days score a mark on the "black board," that will be a credit to their illustrious sire. I refer to Kisber, by Rysdyk's Hambletonian, dam Lady Fallis. He died in your city last year soon after being landed from the Oregon steamer. He died, as I understand, of pneumonia, occasioned by exposure on board of the ship. As I have some experience in shipping horses on board of those ships, I want to call attention of other parties that may do so to the fact that they cannot be too careful of valuable stock under their charge on the trip between San Francisco and any of the ports up this way. It is important that they should have the constant attention night and day of a good careful person of experience, and one who does not get seasick; ready at anytime to make any changes of clothing, etc., that may be indicated. If these precautions had been observed, I think one of the greatest trotting stallions that ever lived would have been alive to-day. I think I know what I am talking about when I speak in such high praise of this horse. I trained him and drove him in the last race that he trotted, and I feel positive that he had but few peers and no superiors as a fast, game and level headed-trotter. I trained him just six weeks on a very poor track, just after closing a season in the stud, and he had covered sixty mares. In his race he made a record of 2:27½ under greater disadvantage of a poor track, and other things too tedious to explain here, than any other horse ever did, making as good a showing in time; and I as much believe as I do that I am writing these lines that he could have trotted that day on one of your good California tracks in 2:18 or better, and I believe that if he had lived, and kept in good health another season, he would have wiped out the best record ever made by a stallion; nor would it have surprised me if he had made the best trotting record ever made. I had no pecuniary interest in Kisber, nor do I own any of his colts, but I never heard of a horse's death that I was as sorry of as his.

While speaking of the great dead, I can't pass by that wonderful horse Milliman's Bellfounder, that died a few years ago in the adjoining territory of Washington, without calling attention to his great prepotency as a trotting sire. I have handled a good many of his colts, and was acquainted with most all of his get that appeared on the turf in this part of the country, and I think them wonderful, considering their opportunities and their breeding on the dam's side. I don't think he ever covered a mare that could trot in three minutes, or one of any pretentious to being fairly well trotting bred, but still all of his colts were trotters. I don't think there was ever one, that had the least bit of handling for speed, but could trot in three minutes or better, and the most of them that had any kind of a show would get below 2:40 in a very short time. He only has, I believe, four in the 2:30 list, but I know of ten or twelve others that have records between 2:30 and 2:35 that if they had been trotted on good tracks would have records of 2:30 and below it. So I think if his useful life in the stud had fallen among a better class of mares he would have ranked as one of the best stallions in the United States.

After considering the good blood by the two above departed ones, and several that are living that we know to be good, we conclude that we are on the high road to success in the breeding of the fast trotter. But before we can compete with California, we have got to in some way overcome our long, rainy winters; and I think of no way to do it except by having covered tracks, something I consider perfectly practicable, and not nearly so expensive as one would think, unless they had made an estimate of the cost, something I have taken the trouble to do thoroughly. The cost to cover a half-mile track, thirty feet wide, will not exceed $2,500, which is a mere nothing when we consider the great benefit to be derived from it. Our most wideawake citizens here seem to see it when their attention is called to it, and I don't think there is any doubt but there will be at least one track of that kind somewhere near Portland before another winter sets in.

This letter I am afraid is already getting too long for you to give space to in your valuable paper, so I will only refer to one of our living stallions in this letter—that one is Hambletonian Mambrino, sold at the dispersion sale of the Reedville trotting stock last fall, and bought by the Hon. Wm. Galloway of Yamhill county, in this State; and as I have had an intimate acquaintance with this horse from his colthood to the present time, I am prepared to say that I think he is one of the greatest horses in this or any other country; he is one of the most perfectly formed and absolutely sound horses in every way that I have ever been acquainted with. He is a beautiful dark bay in color with black points, and judging from what others tell me and from pictures I have seen, he is more like his paternal grandsire, Rysdyk's Hambletonian, than any horse in the country. He is now eight years old, sired by Menelaus, a noted son of the Hero of Chester; his first dam Olean, by Border Chief, by Mambrino Chief; after that he runs into the thoroughbred lines that have nicked the best with the trotter. Border Chief's dam was by Hunt's Brown Highlander that often appears in the blood of some of our best performers on the turf. The first dam of Menelaus was by Long Island Black Hawk, second dam by Duroc, third dam by Coffin's Messenger, by imported Messenger.

Hambletonian Mambrino is the sire of Jane L, a three-year-old filly that was not broken until late in the spring, and had two or three attacks of the pinkeye, but still in the latter part of July, over the worst track that horses ever trotted over, at Vancouver, W. T., beat the get of such deservedly good sires as Kisber, Rockwood and Altamont in a hard-contested race of five heats; although she was, so wild she could hardly be got on the track, owing to fear of the crowd, still she trotted steadily, taking the whip when hard pressed and never made but one break during the race. The track was a bed of dust and gravel five or six inches deep; did not look as though any trotter would keep his feet on it. Again, at the State fair, in September, she beat the same field, with the addition of another good colt by Rockwood, one of the finest contested races of seven heats ever trotted by three-year-olds. Jane L is one of the most level-[illegible]

and game fillies I ever saw. She wes bonght et the Reedville sale for the low price of $650 by a perty, for road purposes, and prohehly will never appear again on the track, which is unfortunate for I think there is hardly eny donht, if she was trained and trotted the coming season, she would get a record of 30 or better. There was another colt of the same age as she sold at the sele, hy the same horse, that I think as well of for making e fast and reliable trotter as I do of her. He was driven on the track hut e few times, hnt could show e three-miunte lick almost at the start. He was knocked down at $350, and resold a dey or two after for $600. Major Magoon of Grant county is his present owner. He bonght him for breeding purposes, and I think he hes secnred a treasure for the purpose. His pedigree traces twenty-three times to imported Messenger.

I met Mr. G. H. Tongue yesterdey, the principal hreeder of fine stock in Washington county, and he tells me he has e colt coming two years old that he is very sweet on, by Hambletonian Mamhrino, out of Springfield Maid, hy Lakeland Ahdallah, her dam hy Alexander's Ahdallah. Mr. Tongue says this colt does not seem to know any other gait hut the trot, and he says the colt that heats him next fall will do to go to California and trot against the hest in the world. I think the stakes for two end three-year-old trotters the coming season will fill well here, as there ere a greet meny gentlemen of means here that have well-hred colts they will put in training as soon as the weether will admit of it. A great drawhack here to the development of our young trotters is the scarcity of reliahle and competent trainers; and there is e good opening for one or two good men here thet thoroughly nnderstand the husiness.

Everyone here that has seen the BREEDER AND SPORTSMAN speaks in high praise of it, and I am in hopes it is meeting with the petronage that it deserves. Yonrs truly,

L. B. LINDSEY..

Reedville, Or., Jan. 18, 1883.

Foreign Turf Notes.

At the sale of the thoronghbreds helonging to the late Mr. H. Jones, held at Tattersall's on the 8th nlt., the famons Prince Charlie, hy Blair Athol, foaled 1869, and winner of the Two Thousand Guineas in 1872, was sold for 680 guineas. At the same sale several blood mares, the property of the late Mr. F. Getton, were sold. Of these the *Sportsman* said: "I am efreid that several of them are destined to he sent to America, the gentleman who not infrequently purchases for the Yankees heing pretty husy at work." The only huyer at the sale who hes heretofore ected for American hnyers was Mr. Weatherhy, who hought four lots, viz.: Gaudalope (1869), hy Neptunus, dam Curacoa by The Cure, covered hy Pero Gomez, 39 guineas; Sorcerer (1873), hy Rosicrucien, dam Bas Bleu, covered hy Isonomy, 480 guineas: Amherwitch (1878), hy Nuneham, dam Sorceress, covered hy Isonomy, 170 guineas, end Choppe (1875), hy Restitution, dam Chopette, covered hy Isonomy, 200 guineas.

In noticing the work done hy horses nnder "training intelligence" on the 8th inst., Marsh is reported as having a long string out at Newmerket, hnt no mention is made of Mr. Keene's horses. The report from Stockhridge, where Mr. Lorillard's horses are located, seys: "Cannon had thirty horses trotting ahont on the flat previous to centering them np Bush Hill. Sachem and Iroquois covered five fnrlongs hriskly."

The entries for the Lincoln Hendicap, to he run on Tuesdey, March 27, number seventy, or four less then last year. As e whole, they are an excellent lot, end incluńe Wallenstein, Sechem, Pinafore, Iroquois and several of last year's fevorites, together with Buchanan, the winner in 1881. The Liverpool Grand National Steeplechase, to he run on Fridey, March 30, received forty-one entries as against forty-three last year, the Irish division heing as nsual very strong, their lot including such veterans as Regal (winner in 1876), Liberator (winner in 1879), and Downpatrick. Among the English lot ere Empress, the winner in 1880, and Woodhrook, the winner in 1881, and the Americen-hred Jolly Sir John, hy Glenelg.

The New Orleans Races Off.

Owing to the continued unfavorahle weather end other causes the winter meeting of the newly organized New Orleans Jockey Clnh has heen indefimitely postponed. There were nearly 100 horses there, and hed the weather been feir an excellent meeting would without donht heve taken plece. The constant rains since before Christmas rendered the track unfit for use, end the outlook thet the weather wonld remain hed decided Messrs. Engeman & Co. to abendon the enterprise until next season. The following card from Mr. Engeman eppeared in the New Orleans papers of the 23d ult.:

"I have found it edvisahle to postpone nntil another season the project of winter reces at New Orleens. Our horse men have heen here, some of them, six weeks. They have had no opportunity to prepare their horses for racing on account of extremely had weether. The stables have heen snrronnded hy weter. The track hes heen flooded and it has heen impossihle for them to get ready to race. Even with fine weather for the next month the horses could scarcely he prepared to start with satisfaction to ourselves and the puhlic. This is unfortunate and to he regretted, hut was unavoidable. The seeson is so far advanced that postponement is edvisahle. Next seasoa, hy the 25th of Novemher, we shall hring here eighty or more horses in training and ready to start early in December and to race whenever the weather permits."

SANTA ANITA FOAL.—On Jan. 24th, at E. J. Baldwin's Santa Anita ranch, Los Angeles county, Athola, hy Glen Athol—Annette, dropped a filly foal by Lexingtor hy Lexington. The foal is hay, right fore foot white and both hind feet half way np to the hocks.

CHICAGO.—This old-time trotter, whose romentic history we outlined e few weeks ago, has heen redeemed from the menial service of a junk wagon, having heen purchased hy Jeck Cottrell. The price peid wes $190.

By a postal from D. Z. Hall, Secretary of the Chicago Driving Park, we are informed that at a meeting of the Directors held on Jan. 19th, J. F. Caldwell, G. S. Caldwell and Wm. O'Brien, who were expelled on June 29, 1881, were fully reinstated.

Duval's Pilot and Lee's Crah, two well-known horses, will trot a mile and repeat race at the Park, Saturday, Feh. 10th, for $500. Pilot will go to a Petalnma cart and Crab to buggy. It is said the race is "for hlood" and no foolishness.—*Reno Gazette.*

Little Brown Jug will, it is expected, be all right again this year. The pacer's lameness last season is said to have been the result of improper shoeing.

Entries at Coney Island.

The Coney Islend Jockey Clnh has made public the entries received for the stakes which closed on the 1st inst. In view of the active rivalry between associetions East and West the entry is larger then expected. end the felling off in the total for 1873 from the total entry for the same events mede in 1882 is mnch smaller than expected in view of the large entry made for other ettractive stakes opened for the first time this year. The totals for the several events are es follows:

JUNE MEETING.

	1882.	1883.
Coney Island Stakes	47	39
Coney Island Cup	28	22
Selling stakes	69	53
Seaboard Stakes	—	51
Two-year-old selling stakes	—	45
Two-year-old post stakes	—	5

SEPTEMBER MEETING.

Autumn Stakes	74	76
September Stakes	45	55
Autumn Cup	34	37

Among the subscrihers appeer the names of nearly all the Eastern owners, inclnding Messrs. Pierre end Geo. L. Lorillard, D. D. Withers, Oden Bowie, Dwyer Brothers, N. W. Kittson, Mr. Kelso, J. A. Grinstead, Fred. Gehherdt, Snedeker & Co., J. E. Kelly, Appleby & Johnson, C. Reed, Cridge & Co., Graham Bros., Burnham & Sons, Blohm & Co., R. W. Walden, Davis & Hall, Fred. Rohinson, R. McClellend, W. R. Bahcock, W. C. Daly, W. Jennings, J. McMehon, L. A. Ehlers, Jeter Walden and the Preakness, Yonkers, Bedford, Magenta end Clyde stables. Among the entries for the two-year-old stakes are representatives of the prominent racing families of the country, while hoth the three-year-old and all-aged stakes present the names of many popnlar favorites. Bnt perheps the most gratifying feeture, especially to the older admirers of racing, is the excellent names found among the entries both for the Coney Island and Antumn Cups, the former at two miles and a qnarter and the latter three miles, which warrents a helief thet hoth will prodnce well-contested races. The entries for eech are:

Coney Island Cup.—P. Lorillard's Herhert and Wyoming. G. L. Lorillard's Greenland and Monitor, Snedeker & Co.'s Girofle and Miss Lumley, F. Gehhardt's Eole, C. Reed's Thora, Graham's Brunswick, Reilly & Co.'s General Scott, Clyde Stahle's Ventriloquist, F. Carter's Secret, J. R. Graham's Halledon, Appleby & Johnson's Forester end Turco, Yonkers Stahle's General Monroe, O. Bowie's Compensation, Davis & Hall's Elle Warfield, G. B. Bryson's Bushwhacker, J. McMahon's Frankie B. and Venture, Mr. Kelso's Rica.

Autumn Cup.—P. Lorillard's Herhert, Hiewasse end Wyoming, Geo. L. Lorillard's Aella, Greenlend and Monitor, Dwyer Bros.' Carley B, Snedeker & Co.'s Girofle and Miss Lumley, F. Gehhardt's Eole, Graham Bros.' Brunswick, F. Carter's Secret, Yonkers Stahle's General Monroe, Applehy & Johnson's Turco, O. Bowie's Compensation, M. J. Daly's Hilarity, C. Littlefield's Free Gold, Reilly & Co.'s General Scott, W. Donahue's Strathspey, Davis & Hall's Ella Warfield, C. W. Medinger's Bonnie Kate, W. Jenning's Infanta and Blarney, W. L. Cassidy's Blazes, L. Hart's Rebellion, Lonisiana Stahle's Warrington, Burnham and Son's Barntop, G. B. Bryson's Bushwhacker, J. T. Williams' Checkmate, G. Coot's Ferg Kyle, J. W. Loud's Lida Stanhope, Morris & Petton's Apollo and Creosote, E. Corrigan's Long Mete, M. M. Allen's Jocko, Mr. Kelso's Bend Or.

Another feeture of the autumn meeting will be the race for the Greet Long Island Stakes, which, eccording to the notice of the Coney Island Jockey Clnh made a year ago, is now a dash of four miles. Conseqnently, the entry at once donhled, and as entries can be made up to September 1st the prohahilities are that the total entry will he larger then for any previons four-mile race within the recollection of race goers of the present day. The horses nominated on the 1st inst. are: Hiawasse, Eole, Thora, Ventriloquist, General Monroe, Compensation, Elle Warfield, Ferg Kyle, Apollo, Creosote end Jocko.

Racing Prospects in Oregon.

The board of managers of the State Agricultural Society heve put out their programme for the next fair, and it includes six deys of as diversified sport as was ever offered in Oregon. The five fnrlongs race for two-year-olds is revived, hut it should have heen mede a fixed event and named the Neyella Stake, after Judge Bybee's flying filly that won it with such ease and in the fastest time ever run at that distance—1:00½. She was a great filly that day; one of the grandest two-yeer-olds ever stripped in America, and recalled old Skedaddle, winner of the greet six-heet rece at St. Louis in 1864. She was pitted against the heautiful Lady Foster and Ballot Box filly, the former heing the very perfection of equine symmetry. Neyella's owner stood hy end saw his mare selling for $8 in pools of $18 end $20, hut she hed run so nnluckily all through the seeson that he lacked confidence to hack her. To our eye, she was the perfection of a finely ordered two-year-old, end we honght her for every dollar we could screpe. At last the flag fell with Neyella far in the rear. "Jnst my luck—whet did I tell you?" seid Bybee, as Lady Foster dashed to the front, followed by the Lulu Riggs filly, while Neyella was let off sidewise in a sort of slinking center. Two fnrlongs were done in this way, and Neyella wes to all appearances out of the race, whensuddenly a hright thought struck her end she appeered to have pressing business at the judge's stand. Quick as an "arrow from the Tarter's how" she took up the running, and in e dozen strokes her long, insidious strides hed laid her alongside the leader, elthough they were still rounding the hend, and Neyella wes on the outside. There wes yet life in the Chewecan filly, and her rider kept her gamely at work, hut the struggle was too nnequal. They entered the homestretch on equal terms, bnt the severity of the pece was beginning to tell npon Lady Foster, end the Lulu Riggs filly was already ont of the race. Half way down the stretch Neyella had the contest won to a certainty, and her rider took a strong pull, with which he won hy five lengths. A claim of foul riding, the most preposterous thing we ever heard, wes mede by the rider of the Lulu Riggs filly, hut the judges very properly refused to entertain it. So Oregon went to the front with the fastest time on record at that distance. In receiving the new "hill of fare," as an old friend of ours used to call it, we greatly regret that there is no stake reserved expressly for three-year-old fillies, as the great want of Oregon at present is a fresh snpply of thoroughhred mares, and the offering of a prize or two in that class would perhaps he the means of hringing more mares to this State. The mare that comes here and heats Neyella next summer can lug off quite a neat little sum of money. Last spring, at Hillsboro and East Portland, she was a hig raw-looking filly with no knowledge of what was required of her, and hence it was not much of a trick for Lou Spencer to heat her; hut we wonld have liked to seeLou Spencer tackle her et Salem. There are no three-year-old fillies east of the mountains, save two at Baker City, and neither of them is fit to he classed with such animals as Ordinance or Sunbeam.—*Oregonian.*

THE GUN.

Marsh Notes.

Last Snnday's dnck shooting wes anything bnt setisfectory to sportsmen. Many went to the fevorite hnnting gronnds on Seturdey evening's trains, for the purpose of shooting by moonlight, hnt they were disappointed on account of the heevy fog that lay like e great white mentle on marsh and hey, end which also kept the qneen of the night from lessening the gloom with her rays of silvery light. On Sunday morning hnndreds more of these enthusiests jumped ont of their "warm, werm cots," and calling their dogs, were awey on the several hoats and trains that leave onr city for the hnnting grounds; nor were they a little disgusted es they groped around for their hoats or stumhled over the marshes in search of their hlinds. Many of those who went to the lower hay mershes returned on the first train without firing e shot. Those who found their hlinds and hed the plnck to wait said thet there is no place like an open marsh in a fog for meditating on the nncertainties of life, end one has an excellent opportunity, too, to call himself a fool for getting out of a comfortable bed, and with no one to dispnte him. Of the many who went to Alviso there were but few who mede good hags, excepting the hags mede hy Messrs. Stack, Hoefling and Spencer. On the Alviso and Alvarado marshes the shooting is es good es it has heen at eny time this year. There are more canvashacks in these localities than has been known for years, and they are in very good condition. From the np-river marshes, islands end ponds the report is not so enconraging, for the hirds are less plentifnl, and as they ere quite poor in flesh there is no sport or profit in killing. The poor condition of the hirds is no donht due to the fect that the frost killed all the natural food, and. they have heen for some time living on short rations. As the Teal Station Clnb is heiting its ponds it is understood that there is plenty of good game on that preserve yet. It will not he long before the dnck shooting will he over, and then the snipe with its uncertain flight will attract the ettention of sportsmen.

BEAR VS. SHEEP.—For quite a period of lete, the sheepmen of Wooden valley, seys the Napa reporter, heve heen trouhled hy the depredations of a colony of hears, known from the tracks to consist of two old ones and three cnhs. They mede hevoc with the flocks of A. J. Raney, and lately killed eight sheep for Mr. Chapman, a near neighbor. Traps have heen set, poisoned meet put out, and other devices employed without avail to destroy the animals. Hunters are not timorous to take a shot at the enimals, who have been hnnted into the hush and inaccessible wilds, hut none of them so far have heen come up with. Nevertheless, the loss of sheep becoming so great, some method to rid the country of these predatory animals hecomes no longer a qnestion of good policy merely, hut one of dollars and cents.

The shooting on the Sen Bruno marshes last Sunday wes very poor, there being no flight during the dey. The fog was so dense thet the hnnters conld not see over twenty yards in any direction. As there wes no windand the lower hay wes es calm as a mill-pond the hirds ley far ont from the lend. Quite a number of sportsmen were down hut many returned without firing a shot. In these marshes is a curiosity in the shape of a Chinese hnnter. This sport (?) says that he frequently kills thirty or forty ducks in a day; he shoots on the wing as well as on the weter.

Last Sunday Messrs. Spencer, Hoefling and Stack were, as usual, at their hunting gronnds at Alviso and hed, as nsually they have, their share of good luck in the pursuit of sport and dncks. Mr. Hoefling and Mr. Spencer shot together and killed upwards of sixty dncks, sixteen of which were cans. Mr. Stack showed np a string of thirty hirds, of which eleven were the mnch-sought-for canvasbecks.

Last Snnday Mr. H. Briggs, Mr. Bogart, Gen. Kirkpatrick, Mr. Higgins and Mr. R. Wilson were up at Sherman Island for a day's shooting; they found thet there was hut little sport, as the flight was rather poor end the hirds poorer still. The party hagged upwards of 80 hirds, hnt they were very thin in flesh and hardly worth the powder that it took to kill them.

According to the *Vanity Fair* the largest individnel hag ever made, or et least officially recorded, wes made hy the present Lord Walsingham on the 28th of August, 1872, when he killed 842 grouse to his own gun. Sir Frederick Milbenk and Lord De Grey have slanghtered vast numbers of gronse in one day, hut their scores ere inferior to Lord Walsingham's.

It will be a pleasnre to his many friends to hear that Mr. R. Brooks, who has heen so long and even dengerously ill, is now on the road to the recovery of his health, and it will not he long ere his hrother hnntsmen will have the pleasure of his company again in the marshes and foothills.

J. D. Enas treed a wildcat near Sunnyside Apiery, Sunday, northwest of town, says the Nape *Register*, and brought him down et the fire of his trusty gun. The animal measured two feet end nine inches in length end weighed eighteen ponnds.

Commodore R. L. Ogden, well known among the shooting men here, and orgenizer of the Tule Belle shooting club, the first of its kind in this part of the world, has gone to Europe from New York. He will he out here in April.

Capt. A. H. Bogerdus hes accepted a chellenge from Dr. Carver to shoot et one hnndred pigeons, "for from $1,000 to $10,000 a side," the contest to take place et Louisville, Ky., nnder English rules.

The Cordelia clnh did not succeed in convicting the men they had arrested for stealing the decoys end the boats.

History of a recent hunt: Scene, Marin County. Two wagons; four men; four guns; nine hounds; one lark.

The cold weether of the last of the week, and the northerly winds, will drive the birds out of the ponds again.

Some of the small sloops which have heen used as "hunting boxes" up river have come hack to the lower hay.

Hunters, with hounds, ahound on Mount Tamalpais, and are strongly suspected of violating the deer law.

Delegetes from the hose companies of Hollister, Watsonville and Santa Cruz, interested in the diamond helt, will meet soon to decide the date and locality in which the next contest for that prize is to take place. Watsonville and Hollister have each had it once.

(Concluded from page 65.)

for recountiug here. The Mohawks are coming prominently to the front. The great young horse Overman, 2:20, is hy a son of Mohawk, Elmo, and Yellow Dock, that trotted in 2:11 with running mate and in harness in 2:20¾, is hy another son, Clark's Mohawk Jr., the descendants of Davy Crockett, among them Red Cloud, 2:18, and Etta Jones, 2:20. Long Island Black Hawk was the sire of Mohawk, so that there is again the blending of the lines of Abdallah and Andrew Jackson.

There are so many Almonts on the Pacific coast that very many of our readers will he interested in the following hietory:

Almont made his first season in the stud in 1869, and the first of his produce started in 1873 at two and three years old. Four of his get started and all were winners. In 1874 five of his get started and four of them won, among them the four-year-old Allie West, who made a record of 2:29½, the fastest ever made by a four-year-old to that date. In 1875 eleven started and six were winners, among them Piedmont, who made a fonr-year-old record of 2:30¼ in third heat, the fastest ever made to that dats by a four-year-old in third heat; and Allie West, after a full season in the stud, reduced his record to 2:25. Up to an d including 1876, Almont had thirteen winners. That year they started in twenty-four races; won first money in eight, second money in eight, and third money in two, winning money in over two-thirds of the races in which they started. In 1877 four new winners came out, among them Katie Jackson, four-year-old record of 2:25¾ in third heat, and Alice West; four-year-old record of 2:29¾ in fourth heat. Eighteen hnndred and seventy-eight brought out nine new winners, among them Aldine, with five-year-old record of 2:28¾ in seventh heat. Easter Maid this year reduced her record to 2:29, and Alice West reduced hers to 2:27. In 1879 fonrteen new winners came out. Ella Earle made a record of 2:25; Fanny Witherspoon (five years old), 2:26; Mnsette, 2:30, and Clermont 2:30, and Alice West reduced her record to 2:26. In 1880 thirteen new winners were added to the list, and four new ones entered the 2:30 class, viz: Piedmont, record 2:21¼ (public trial of 2:18¼); Alta (six years old), 2:25½ in sixth heat; Sannie G, 2:27, and Una, 2:29 in third heat. Musette reduced her previous record of 2:30 to 2:29¼, in third heat, winning the second, third and seventh heats. Fanny Witherspoon reduced her record to 2:25 in sixth heat, winniug fifth, sixth and seventh heats.

The results of the trotting season of 1881 added more to the reputation of the Almonts than any previous year. A number of his produce won. Two new ones made records of 2:26, or hetter, aud two others made records below 2:20. Early Rose made a record of 2:25½ in third heat, winning fourth heat and race in 2:26½. Hamlin's Almont Jr. made a record of 2:26 in second heat, winning the third heat and race in 2:27¾. Piedmont reduced his record to 2:17¼, made in fourth heat, the fastest record ever made hy any stallion in fourth heat, and only then excelled by Smuggler who in first, second and third heats has a faster record, hut was beaten by Goldsmith Maid in 2:17¼ in fourth heat of the race in which he made 2:15½ in first heat. In 1882 Jerome Eddy made a stallion record of 2:16½ in first heat, hut the fourth heat was a dead one in 2:20, and he was heaten in the race by Black Clond. Piedmont won his race, making a record of 2:19½ in fifth heat, and 2:21 in sixth heat. Fanny Witherspoon made a record of 2:19¾ in third heat, and won the fonrth heat in 2:20. Aldine won a six heat race, reducing her record to 2:26¼ in third heat, and winning sixth heat in 2:27½. King Almont won a six-heat race, making record of 2:30½ in fifth heat, and Una made a two-mile record of 4:54¼.

In 1882 the Almonts grew rapidly in favor with horsemen and the general public, and greatly increased their reputation as game and fast and reliahle trotters.

Aldine, early in the season, won a hotly contested race of aeven heats, winning the third, aixth and seventh heats, and closed the season hy winning at Hartford, Conn., on August 29th, the 2:26 race, heating a field of eight in 2:20, 2:20, 2:22; and with only one day intervening, won the 2:23 race in 2:20½, 2:19¼, 2:19¼. She was then sold for a large price to Wm. H. Vanderbilt, af New York city, who had previously purchased the Almont mare, Early Rose. Early Rose, in 1882, won a number of hotly contested races, and as early as June 21st, at Hartford, Conn, reduced her record to 2:20¼, made in fourth heat of the 2:26 race, winning the first, second and fourth heats in 2:22, 2:22½, 2:20¼. On the 27th of June, at Poughkeepsie, N. Y., Early Rose won the 2:23 race, winning the first, third and fifth heats in 2:22¼, 2:22, 2:23; the second being a dead heat with Tariff in 2:20¾, and the fourth won by Pickard in 2:22¾.

After thia she was sold to Wm. H. Vanderbilt. He had Aldine and Early Rose harnessed as a douhle team, and the firet time they were speeded together they trotted the mile out in 2:25½, and within two weeks trotted the Charter Oak Park track in 2:16½, the fastest time ever made by a donhle team.

Fanny Witherspoon won the 2:19 race at Poughkeepsie, N. Y., Angust 25th, in straight heats, in 2:19, 2:18½, 2:18¼, beating the noted trotters, Pickard, 2:18¼; William H, 2:18½; Driver, 2:19½; Capt. Emmons, 2:20 and Humboldt, 2:20.

Westmont, a seven-year-old aon of Almont, out of a pacing mare, made his first appearance on the turf in 1882, and early in the season made a pacing record of 2:26, and has heen campaigned all through the snmmer and fall, and into the winter, pacing prohably more races in 1882 than any horse on the turf, thus ahowing wonderfnl game and endurance. At Lawrence, Kan., Sept. 23d, over a half mile, he won the 2:18 pacing race, taking eecond, third and fourth heats in 2:21¾, 2:22¾, 2:23¾, the first heing a dead heat with Lone Jack in 2:22.

Lillian started the season with a record of 2:40¼, which, on the 19th of May, she reduced to 2:26 in fourth heat; and on September 16th she won the free-for-all trot at Lonisville, Ky., winning second, third and fonrth heats in 2:23, 2:26½, 2:25, beating France's Alexander, winuer of the great stallion race at Rochester, N. Y., in 1881, making a record of 2:19, and Deck Wright record of 2:19¾. She was then sold for a fancy price.

King Almont entered the 2:30 class on the 29th of September at Alhany, N. Y., winning the third, fourth and fifth heats in 2:26¾, 2:29, 2:26½. At Philadelphia, Pa., Oct. 4th, King Almont wou the second, third and fourth heats in 2:26¼, 2:28¼, 2:26¼, and at Boston, Mass., won the 2:26 race, winning the second, fourth and fifth heats in 2:27, 2:28½, 2:26½.

Starlette, bred at Fairlawn, sold, and name changed by owner to Annie S, after ahout six weeks' handliug, started in her first race at Louisville, Ky., September 12th, and made a record of 2:28¾ in second heat. She afterwards won at Chicago. At Lexington, Ky., October 16th, Annie S won one of the most hotly contested races ever trotted by a green five-year-old, winning the fourth, fifth and seventh heats in 2:26¾, 2:31¾, 2:32.

It is not intended to refer to all the Almonts that trotted in 1882, but it is deemed proper to mention a few of them.

Atlantic, sold from Fairlawn to R. W. Davis, of West Williamsfield, Ohio, started in his first race as a four-year-old at Youngstown, Ohio, Sept. 22d, after having served forty mares, and won the four-year-old stakes at his eese, making a record of 2:39¼. It is published that he trotted a qnarter in his race in 36 seconds and trotted a mlle in 2:29¾, the last quarter in 35 seconds—a 2:20 gait. While this is no record, I have full faith in the performance, as Mr. Davis has settled with me the extra price to he paid when the colt trotted in 2:30 or better.

Harhinger, a three-year-old Almont, won the three-year-old stakes at the Maine State Fair, Sept. 26th, distancing the field the first heat, and Venetia won the two-year-old stakes at the State Fair held at Salem, Oregon, in September, 1882. At Yreka, California, Altamont won the free-for-all trot, making a record of 2:37¾ in third heat. The mnd was deep and stiff, and the owner of Altamont writes that but for this, there would be another Almont in the 2:30 list.

In 1882 the grandsons and granddaughters of Almont made a very remarkable showing, winning the colt stakes and other races, from Oregon and California across the continent to Maine. For want of space, only a brief reference can be made to their performances. Maggie Arnold, hy Almont Mamhrino, won in Oregon hotly contested races, and closed the season by winning at Yreka, California, the free-for-all race for horses in the district, taking second, third and fonrth heats in 2:36¼, 2:35,? 2:37½ over a slow track. Zilophone, by Altamont, won at the same place the three-year-old etakee, distancing his competitor in eecond heat in 2:57, and was sold for $1,000. At Union, Oregon, Au Revoir, by Alwood, won the two-year-old stakes. At Chico, California, Telegraph, by Tilton Almont, won the three-year-old stakes, winning second, third and fourth heats; and Almoone, by Algona, son of Almont, was second in last heat, and made so good a showing for a green colt, that had bnt little handliug, that a number of mares were engaged to his sire at $150 stud fee for 1883.

At Manhattan, Kansas, Harrop's Tom, by Almont Prince, won the three-minute race, winning the third, fourth and fifth heats; and Mable H, hy Col. West, son of Almont, won in Missouri, and afterwards ahowed a trial of 2:27 over the Milwaukee track, and was sold for $3,000.

In Iowa and Illinois, the four-year-old filly, Lorelle, by Almont Rattler, won the four-year-old stakes and other races, among them a free for all trot. Zingara won the three-year-old stakes at Clinton, Iowa, winning first, fourth and fifth heats, and also won at Alhany, Ill., and De Witt, Iowa. Theta also won the three-year-old stakes at Muscatine, Iowa, and Oprhia won as a two-year-old. All these were sired hy Almont Rattler, one of the finest sons of Almont. His get had previously won the two and three-year-old stakes in 1880 and 1881. At Bloomington, Ill., Almont M, by Almont, Jr., won the fifth, sixth and seventh heats of the 3:30 race, the seventh heat being trotted in 2:48. Alcaid, by Alroy, son of Almont, won a five heat race in Illinois. Victor Almont won the three-year-old stakes at Norwalk, Ohio, winning first, second and fourth heats. At Wyauwega, Wis., Alar Clay, Jr., hy Alar Clay, son of Almont, won the three-year-old purse. At Portland, Maine, Glenarm, hy Constellation, won the four-year-old stakes, making the fastest time ever made hy a Maine-bred fonr-year-old; and also won the four-year-old stakes at the Maine State Fair at Lewiston, and Gallant, also by Constellation, won second money, the other four starters being distanced. The get of Constellation had won the two and three-year-old atakes in 1880 and 1881.

Maud T, by Hamlin's Almont, Jr., came out this season without any record, and on the 18th of May, at Mayaville, Ky., made a record of 2:26 in second heat, and 2:29 in third heat; aud on June 9, at Detroit, Mich., won a seven-heat race, taking first, fourth and aeventh heats, heating Walnut and Florence M. At Toledo, Ohio, shc won the fourth, fifth and aixth heats, heating Doct. Norman, Commander, Barret, and other fast horses.

Annie W, by Bostick's Almont Jr., began the aeaaon on the 16th of May, at Mayaville, Ky., winning the 2:20 race in straight heats. She afterwards won the 2:20 trots at Columbus, Ohio, Detroit, Jackson, East Saginaw, and Grand Rapids, Mich., beating such noted horses as William H, record 2:18¾; Croxie, 2:19¼; Driver, 2:19½; Dick Wright, 2:19¾; Fanny Robinson, 2:20¼; Voltaire, 2:20¼, and Red Cross, 2:21½.

Catchfly, out of a mare by Almont, won the 2:30 trot at Lexington, Ky., October 14, making a record of 2:27¼ in third heat.

Attention is called to the very important fact that these winners in 1882 were sired by thirteen different sons of Almont, which shows that Almont not only sires fast trotters himself, hut transmits with great nniformity to his sons the ahility to sire fast and game trotters. This demonstrates his wonderful prepotency as a trottiug sire. The chief glory of a sire is that his descendants shall he an improvement on himself, and from present indications the probability is that some of his sons will prove to be more successful sires of fast trotters than Almont himself.

Twenty of the sons and daughters of Almont now have records of 2:30, or better; and three of them have records below 2:20. This ie about double as many as any trotting stallion now living, or that ever lived, had at same age. He already has more of his get with records helow 2:20 than his distinguished grandsire, Rysdyk's Hambletonian, and more than any stallion of any age has, except Volunteer, who is now old enough to be his grandsire. Four of Almont's sons have already sired five trotters with records of 2:28¼, and under, viz.: Annie W, 2:20; Jewett, three years old, record of 2:23½, since ıednced to 2:22½; Lizzie 2nd, 2:23½; Maud T, 2:26, and Rachel B, 2:28¼, and a daughter of his produced Catchfly, that made a record of 2:27¼ in 1882.

The following is a list of the get of Almont that have records of 2:30, or better, with year and heat in which they made their fastest record:

1. Piedmont	2:17¼.	4th heat.	1881.
2. Fanny Witherspoon	2:18¼.	3d "	1882.
3. Aldine	2:19¼.	3d "	1882.
4. Early Rose	2:20¼.	4th "	1882.
5. Westmount (pacer)	2:21¼.	2d "	1882.
6. Lillian	2:23.	2d "	1882.
7. Ella Earl	2:25.	3d "	1879.
8. Allie West (5 years)	2:25.	1st "	1875.
9. Alta	2:25½.	6th "	1880.
10. Katie Jackson (4 years old)	2:25¼.	3d "	1877.
11. Alice West	2:26.	2d "	1879.
12. Almont Jr. (Hamlin's)	2:26.	2d "	1881.
13. King Almont	2:26½.	4th "	1882.
14. Annie S (5 years)	2:26¾.	4th "	1882.
15. Sannie G	2:27.	1st "	1880.
16. Almont Jr. (Bostick's)	2:29.	1st "	1875.
17. Dolly Davis	2:29.	1st "	1875.
18. Musette	2:29¼.	3d "	1880.
19. Una	2:29½.	3d "	1880.
Una (2 miles)	5:54¼.	1st "	1880.
20. Clermont	2:30.	4th "	1879.

The pecnliar excellence of Almont as a sire is the uniformity with which he stamps his image and impresses his own remarkable qnalities on his offspring. All of his foals, out of all classes of mares, are horn with a disposition to trot. As a uniform sire of fast trotters he stands without an equal. This might be expected from the great amount of speed-producing hlood that is concentrated in his veins. He comes hy his great prepotency honestly—by right of inheritance.

The special attention of hreeders is called to the remarkable fact that three of Almont's get with records of 2:30, or better, one with two-mile record of 4:54¼, are ont of strictly thoroughbred running mares, and that two others of his get with records respectively of 2:25 and 2:25½ are out of maree whose dams were thoroughbred running mares; and another with a record of 2:18¼ is out of a mare hy a running bred horse, and with no other known crosses. No other trotting stallion has ever accomplished such results.

At it Again.

Tbe point of superiority as marksmen between Police Officer P. D. Linville and George H. Brown has not as yet been decided to the satisfaction of the first named. Three weeks ago Linville was beaten one point in a fifty-shot match by Mr. Brown, and again last Sunday tbeso two came together and Linville was again beaten four points in 100 shots, but still undaunted by his past experience he steps up to tbe mark and cballenges Brown to shoot anotber match. Like thc bull tbat charged on tbe locomotive, "his pluck is to be admired, but d—n his judgment." We have seen barn-yard fowls of no particular breed kick and pick at eacb other for hours at a time and bccause some passerby stopped and looked at tbe ridiculous contest imagine that they were of game cock blood and crow all tbe louder. And it is witb buman beings as with dumb creaturcs: The loud crowing about $200 gold medals, $100 purses, etc., etc., bas attracted the attention of tbc public and brougbt forth an amused smile at tbe ridiculousness of sccond-class shots shooting for first-class stakes. Gentlcmen, tho public eye can sce througb the mantle of deccption that was thrown ovei them—'tis a little too tbin, just a little too thin. It would be better not to shoot for stakes at all than to have a $200 gold mcdal every timc. As abovo alludcd to, another matcb will come off on the 11tb of February between Mr. Brown and Linville at Shell Mound Park. The conditions are 100 shots at 200 yards for a $200 gold medal (?).

The Fusileers.

Last Sunday the San Francisco Fusileers, Company C, First Artillery Regimeut, N. G. C., held their first quarterly class shooting at Shell Mound Park. Iu the first class Lieut. H. J. Mangels won the prize gold mcdal with the following score: 5, 4, 4, 4, 5, 4, 5, 4, 5, 4—44.

In this class L. Haake shot second hest, making a total score of 43; third, Sergt. O. Lemke, 43; fourth, Capt. Johu Bruer, 40; fifth, F. Kuhls, 39 points.

In the second class Lieut. A. Hieber won the gold medal with the followiug score: 4, 4, 5, 4, 3, 4, 4, 5, 5, 4—42.

Second, Corp. C. F. Repenn, 41; third, W. Fischer, 39; fourth, Sergt. D. Welhern, 39; fifth, J. C. Nobmann, 36.

The third class, the silver medal, was won by F. Koch. Score: 3, 4, 4, 4, 3, 4, 3, 4, 3, 3—35.

Second, Corp. H. Schultzen, 35; third, J. Schn . fourth, H. Dietrich, 31; fifth, S. Morcue, 25 points

HERD AND SWINE.

"An Extensive Dairyman"—A Tale of To-day.

Once npon a time, oh, so very long ago that none hnt the "oldest inhabitant" recalleth the time, even nnto the month of September, in tbe year of onr Lord MDCCCLXXXII, there came to the State called California certain wise men from the East, full of cunning desires wherewith to enable them to extract blood from a turnip, or to perform the equally marvelous feat of converting the fat of bulls and goats into the fragrant flavored butter of the creamery. These men reveled in wealtb and fared sumptnously every day; but alas, that every rose must have its thoru; tbat with the highest bliss there is tbe alloy of paiu. Wherefore should these men have a "soft thing" and die in oblivion, and let their secret perish with them; yea, verily, their hearts were pained within them that no man knew of their "discovery" (?) or bonght shares in their company. Burdened with this grief, they sougbt solace in travel, and wended their way nigh nnto the town called Santa Cruz. Here they found two fellow citizens whose hearts swelled with sympathy. One was "an extensive dairyman," Mr. Less, and tbe other his friend, Mr. Laffey. These gentlemen were then engaged with a demijohn and a deck of cards in conducting a campaign for "reform" in connty offices, hut being persuaded, they consented to confer upon these strangers a degree of notoriety in exchange for a share in their wealth. The "extensive dairyman" commenced at once, and Mr. Laffey associated his brother in the scheme, who became the most active partner. From this time the fame of oleomargarine began to spread abroad in the land. The impending ruin of the dairy interests was vociferonsly hewailed by the "extensive dairyman" and Brother Laffey. Calls, correspondence and conventions qnickly succeeded. Brother Laffey fled not from the pen of the reporter, hnt loudly lamented the manifold trausgressions of the "hull butter" men. But lo! a light shone round about him; a light, as it were, reflected from the shining faces of douhle eagles, and he looked and saw, and behold, the "vile compound" called "bull butter" was a delicions table delicacy. Saul of Tarsus, transformed to Paul the preacher, was not a more changed man than Laffey the oleomargarineist. He frequented the Palace Hotel, smoked fine cigars, drank choice champagne, and went up and down the streets of the great city proclaiming the virtnes of oleomargarine, and was the hero of an advertising interview in the *Chronicle*. Whereupon Mr. Less, the "extensive dairyman" suffered so from surprise that he "drove to the ranch, twenty miles off," and then came to the great city of San Francisco to hear Laffey relate his wonderfnl experieuce. He was told to take the "same path of bonest investigation," and behold the same light shone round abont him which had been so dimly seen a few weeks before, and he heheld that "oleomargarine will have a good effect on the dairymen." In the full tide of his joy and when he was "very favorably impressed" with oleomargarine and its manager, Mr. James W. Wilson, tbis "extensive dairyman," hy a remarkahle coincidence stnmhled "naturally" upou a *Chronicle* reporter, to whom he spoke in the diction of a Macanlay of his great prejudice against oleomargarine, and his remarkable conversion, all of which duly appeared in the "paid" colnmns of that paper. Henceforth oleomargarine and its makers are famous, and Messrs. Less and Laffey return to the obscnrity from which they were temporarily lifted hy the coin of the oleomargarinc meu.

O. OF THE B. D.,

[Which is One of the Bulldozed Dairymen.]

—*Santa Cruz Courier-Item.*

Shepherd Dogs.

As the industry of sheep husbandry has increased within the past few years, these most useful auimals have come into greater demand. In consequeuce, many breeders, partly to advertise their dogs, and partly to exhibit their skill in training them, have inaugurated field trials for shepherd dogs. At these a certain nnmher of strange sheep are procured, a course is staked off, and at its end hurdles are erected with a gateway, and still further ou an inclosure, in which is left a narrow opening, through both of which the dogs, after driving three or more of the sheep around the staked course, must make them go within a given time.

When taking into consideration the facts that the sheep and the course over which they are to be driven are hoth nnknowu to the dogs, the difficulties of the task are readily seen. Bnt, naturally sagacious as they are, and thoroughly trained to obey their masters' commands, what would seem an impossibility is accomplished with comparative ease.

These trials are of inestimable henefit, as they stimulate careful breeding and thorongh handling of the dogs, and place them within the reach of farmers at more reasonable prices than they would fetch were the number of trained dogs less. The pnre bred "collie," when raised amoug sheep, learns to care for tbem instinctively, and some of these untrained animals have been known to perform acts almost denoting reason; though, to have the dog display his latent intelligence, he requires education, and then his performances are at times wonderful.

A case is recorded of a sheep thief, who carried on his nefarious trade through the medium of a collie dog. This villain had only to desiguate a particular sheep to his dog as they would pass a flock, and in the dead of night the faithful animal would go and drive the identical sheep from among his companions to a secluded place, where the master, unobserved, would butcher it, and take it off to some neighboring mart for sale.

Another one of these dogs would drive an entire flock of sheep from one town to anotber, unattended by any one, and no matter how rough the eountry or inclement the weather, the same dog could be depended on to assemhle his flock, and such was the confideuce the sheep had in him, that they obeyed his occasional bark as though it was a comprehensihle language.

We might illustrate the collie's sagacity in hundreds of instances were it necessary, and the temptation is so great to expatiate upon so nohle and valuable an animal, hut we mnst stop somewhere; at any rate, we can confidently urge upon every farmer to become the possessor of one of them. Destroy all other hreds, if necessary, and the end of sheep killing will have been reached, and a trusty, faithful guardian for tbem, the cattle, and home substituted.

INTERESTING TO SHEEP-RAISERS.—Senator Spencer of Napa has introduced a hill for the protection of sheep, providing that the owner, possessor or harhorer of dogs or other animals that kill, wonnd or worry sheep or goats shall he liahle to the owner thereof for damages and costs of suit, to he recovered before any Court of competent jurisdiction. It shall not be necessary to prove that the owner or harborer of the dog had knowledge that the dog was dangerous to sheep. Any person finding any dog wounding or killing a sheep or goat on the premises of its owner may kill tbe same at the time, and the owuer of tbe dog has no redress at law.

Great Milking Shorthorn Cows.

Stirred up at length by the constant reports of the large yields of milk of Holstein cows, and of butter of the Guernseys and Jerseys, the breeders of Shorthorns are just beginning to tell what their cows are capable of doing in the dairy line, and we hope they will continne tbis exhibition for the henefit of the country, Formerly the Shorthorns were universally bred for a combination of great milk yields, and, when dried off and fattened, for making quickly and cheaply an excellent carcass of beef. Bnt latterly, among perbaps a majority of their breeders, their beef points have been more generally cultivated than those of the dairy, the former being more profitable than the latter in the Western States where they are much more extensively hred than in the Easteru.

In the *Breeder's Gazette* we find recently reported the milking of a Shortborn cow belongiug to J. F. Jones, of Clark county, Ky. On March 16th her owner began weighing her milk with tbe following results:

	Days.	Pounds.
March	15	576
April	30	1,236½
May	31	1,395½
June	30	1,535
July	31	1,516
August	31	1,398½
September	30	1,219
October	31	889½
November	15	392
In 244 days		10,068

Her greatest yield in any one day was 63¼ ponnds. "For the first moutb this cow was fed on hay and grass with the rest of the herd, having no grain whatever."

Considering the above feed for the cow, we think her milking extraordinary, as it must be recollected that the cows of other breeds, wbose great records of milk are given, have been stimnlated during the trial with all tbe best food for tbe production of milk, which they could digest. This is a great extra advantage to them, for we know as a general rule that the way a cow is fed adds largely to or diminishes tbe quantity of milk she will give. Hereafter we will report some butter products of Shorthoru cows approaching those of the best of the Channel Island breeds.—*Rural New Yorker.*

Fattening Sheep for Market.

The hest plan of fattening sheep depends upon many considerations: First, npon the hreed of sheep, aud secondly, upou the age and condition of the sheep. The hest plan requires the feeder to hreed tbe sheep he fattens, and to keep them always in a thriving condition, so that when they reach the fattening stage they are ready to appropriate the food given to lay on fat at once, and do not require a preparatory stage, which always costs much food before they begiu to lay on fat. When sheep are properly bred and fed till two years old, if wethers, tbey may he fed np rapidly for market at any time of year and will feed profitably in winter. Bnt if sheep are thin—have heen kept in an nnthrifty habit—ninety days is likely to be thrown away in giving them a start. Such nnthrifty sheep should he fed in warm weather with grain, upon pasture. Here they may he started in less than half the time required in winter, and on one-fourth of the food. Young sheep, or under three years old, require a more nitrogeuous ration than old sheep, for the young sheep have the muscles to grow, and older thin sheep have already much more muscle than fat. This may be an explanation why we succeed in fattening an old cow upon good pumpkins, and the English, old sheep upon turnips, both of which foods are too poor in nitrogen to fatten or grow young animals. Yet English farmers have hecome so accnstomed to feed turnips to all stock, that they feed weanling lambs all the turnips they can eat, aud report feeding six-month lambs eighteen pounds per day. This is a douhle error, hecanse the turnip is too poor in nitrogen, or mnscle-forming matter, and phosphate of lime to grow the bones, and also contains too much water in proportion to dry matter. Young grass is the typical food for growing young animals, and the average of pasture grass contains seventy-five per cent. of water, whilst ruta-hagas contain eighty-seven per cent., and common turnips ninety-two per cent. water. And these turnip rations are given in cool or cold weather, which makes the excess of water the more objectionahle.—*National Live Stock Journal.*

Improvement in Meat.

The tardiuess which has attended improvements npou onr meats, especially heef, has come largely from want of proper association hetween the steer upon the hoof and the steer npon the hlock. Prodncers have not exacted a better prodnct hecause they have been totally ignorant of the great differences in this, aud upon what these differences depended. Even in onr day, the variation in the interior quality of the meat of animals whose outside formation and appearance is quite alike, is only partially understood, and is scarcely estimated when the price is fixed. It is donhtful whether tbe same degree of ignorance exists among consumers in any other line, as all other products are closely analyzed and classified, prices varying materially upon slight differences.

This comes, as stated, largely from the single-handed natnre of the industry, every farm having its own standard, which, in too many cases, amounts to no standard at all. Our fat-stock shows come in opportunely to change former ideas, and will prove to he an edncator of the highest valne. These exhibitious draw the lines closely, and these lines are so distinct as to he readily seen hy all. An important lesson, that all learn from these exhihitions, comes from the simple fact that no animal other than those well graded up are entered for prizes.

As a rule, those that are the deepest in improved blood are the most conspicuous as possessing rare merit. This was notably the fact at the last show in the case of certain purely-bred steers helonging to prominent families in the herd hooks, and the growth aud development of these animals, and the manner in which they prove upon the block, will naturally be looked to in the future with interest. If any one questions that the development of the meat question is a matter of slow growth, let him consider that it is only as we near the close of the nineteenth century it has dawned upon feeders that the hest aud most profitable heef is produced hy feeding till two years, in the place of till the age of four or five, as heretofore.—*National Live Stock Journal.*

If ranchmen expect to keep their improved bulls, of whatsoever breed, alive and in good working condition, they must take the same care of them as they were accustomed to where roared. Their cows must he brought to them for service. In this way a bull will beget more calves annually, and these will be better in every respect, than where a bull is allowed to run at large.

Live Stock Insurance.

The henefit of mutnal insurance of live stock is heing practiced by the Scandinavian residents of all the colonies aud the town of Fresno. This is a close corporation, none but Scaudiuavians being admitted to its benefits. They have the usual officers helonging to such associations, and besides which they have what they term an Investigating Committee, consisting of three members, and a Finance Committee consisting of two members. The object of their association, say tbeir by-laws, is to secure the members against loss in their horses, mules or cattle by sickness or accident. Tbe admission fee is fifty cents. Tbe association meets once a month and seven members constitute a quorum. A monthly assessment of one-qnarter of one per cent. is collected on all the assessed stock owned hy tbe members until the full sum of $50 is in the treasnry. Upon the loss of any animal insured, the owner receives two-thirds of the value thereof. No horse is valned at over $75, and no cow is valued at over $45. The association provides no beuefits for lost or stolen animals. The objects of this institution are highly laudahle to its members, as many a poor man can thus at small expense save himself from ruin through the loss of his horses or cattle by disease or accident. This excellent protection from snch losses can be adopted at little tronble or expense by other residents than the Scandinavians, and no douht will he to their great advantage and safety from a financial point of view. Two-tbirds of the value of a dead animal will enable a poor man to obtain another cow or horse where, had he nothing to make payment ou another, he might he compelled to relinquish all hope of obtaiuiug more stock to serve his purposes. As the Scandinavian society does not admit outsiders into fellowship, would it not be a good plau to organize a similar society with headquarters in Fresno, taking in as a member any stockraiser of good moral character, providing he is au American citizen? We helieve such a society wonld inure to the good of the wbole community.—*Fresno Expositor.*

Pig-Feeding in Winter.

If hogs are to be fed through tbe whole winter, corn alone will not he found most profitahle for growth and healtb. We bave no doubt that an exclusive corn diet tends to disease; tbat it soon creates a feverish condition of the system, and often lays the foundation for that most dreaded, cholera. Hogs lean in flesh will get along very well for a few months on clear corn, but there is great danger in continuing it too long. Tbe hog being natnrally a grass-eating animal, cannot be healthy on snch concentrated food as corn.

Early cut and nicely cnred clover hay will be eaten with a good relish by bogs in winter, in small quantity. If hogs are in a pen so warm that it does not freeze, then the best way is to cut the clover in a feed cutter, moisten this bay, and mix the meal for each hog with two quarts of cut hay, and let it lie in mass, and warm up for twelve hours before feeding. The hay will all be eaten with the meal, and this will prevent any fever in the stomach and keep the bogs healthy. This is not a fancy ration, bnt a practical one we have tried with mnch satisfaction.

Never had a better gain than with clover hay, cnt, moistened and mixed with corn meal in this way. The hogs gained ten pounds to each bushel of meal fed through a cold winter. When two or three-month pigs are fed, there is still greater reason for feeding other food with corn. We have had uniform success with an equal mixtnre by weight of corn, oats and hran. Pigs grind their grain very well, and this mixture will he well digested. Where linseed meal is easily obtained, this might profitably be substituted for the oats, or a part of them. This meal contains so large a proportion of muscle-forming matter and phosphate of lime for the bones, and in so digestible a form, that one-half to one pound will produce a rapid growth in the pig.—*Live Stock Journal, Chicago.*

Milking Unruly Cows.

Messrs Haggin & Carr have a novel way of manaaging unruly cows at their dairy near Bakersfield, Kern Co. A corral is made triangular in shape, and in one corner is an opeuing which leads into a long passageway, about one hnndred and twelve feet in length, two and a balf feet wide, and bigh enough to admit the tallest animal. The passageway, or hall, has a gate at either end, and is divided off into sixteeu stalls, of seven feet each hy inserting hars across it. The cows are driven from the triangular corral into this hall, tbe bars having of course first heen removed, and when full the hars are inserted in their proper places, each cow heing confined in a separate stall. Each stall has a separate gate, about two feet square, directly under the animal's udder. The milker opens this gate, seats himself, and milks; after which he closes the gate and proceeds to the next, nntil all have been milked. The front gate leading into the pastnre is theu opened, the hars removed and the cows allowed to pass on into the pasture; after which the gate is closed and the stalls again filled from the corral, and so on until all have heen milked. Mr. Brown, who is in charge of the dairy, says the plan works to perfection. Every cow on coming in must first pass through this lane. After hecoming docile, they are turned iuto the larger corral with the gentler stock. Bnt if they prove intractable, they are giveu two calves to snpport, and coutinned in the stalls until they accept them, and are then turned into the pastnre. Heifers, Mr. Brown says, are broken here without the slightest trouble. They learu to stand from the first, aud beiug subject to no ill treatment, soon lose all fear of mau.

LIVE AND DRESSED WEIGHT OF CATTLE.—Messrs. Swan of Ediuburgh, the well-knowu cattle dealers, write as follows regarding the proportion of heef netted to tbe live weight of cattle: We should say that well finished two-year-old cattle will yield sixty to sixty-two pouuds of heef per 100 pounds live weight. The primer the quality and the younger the animal the more heef is given. For a finished tbree-year-old hullock we should say from fifty-eight to sixty-one ponnds of beef per 100 ponnds live weight. We calculate that fat cattle generally yield fifty-five to fifty-eight pounds, according to quality. In weighing them alive, in order to get at the dead weight, they should he fasted twelve hours, or, if weighed full, or after heing fed and watered, a reductiou of five per cent. ou this account should be takeu from the gross live weight.

Stock cattle are reported to be exceediugly scarce in Arizona and very high priced. Cows without calves average in price from twenty-three to twenty-six dollars per head; with calves ten dollars additional is demanded.

The people of Oregon are applying heroic treatment to horse and cattle thieves. They have substituted a rope and a tree for courts, jurors and attorneys. This method saves expense, aud will be salutary in its effects.

A Glorious Scrimmage at Foot-Ball.—A yonng candidate for the honor of bearing Her Majesty's commissiou writes as follows to his sister: "Before the match was begun the other side was supposed to be best, but when half-time was called neither had scored anything. However, they soon got a try, but failed to kick a goal, and then we went on again pretty evenly till five minntes before time, and then I made a pretty good run and dropped a goal. They made a desperate effort and got very close to our goal. A fearful scrimmage followed; the hall came out, I collared it, made a last rush into four or five tellows, a huge crash and time was called. I fell awkwardly on a fellow's kuee and it racked a suspensory ligament near my thigh, hnt I had my left elbow well jammed into his mouth and on withdrawing it two teeth had gone, his lips were cnt and his mouth full of blood. There was a fellow partly underneath both of us who smashed his collar hone, while a fourth got up with a bleeding nose. It was a terrible finish, but can be accounted for by the closeness of the game (there was a little jealousy between the two clubs) and the hardness of the ground from frost."—*London Post.*

Whatever they undertake to do on the Pacific Slope, as California is generally called, they like to do thoroughly. They have given the biggest prizes for trotting races, and either bred or brought out some of the fastest trotters iu America; in fact they are good at sport all round. Bnt such sport requires a proper record, and this has been furnished hy a paper called the *Breeder and Sportsman*, which, from some nnmbers sent to us, seems likely to become to the West what the *New York Spirit of The Times* is to the East. Each paper contains a likeness of some celebrated horse of California, with a full history of the animal, and there are the usual reports of racing and other sporting matters interspersed with sporting stories and correspondence. Both the printing and paper are good, and altogether it is very cheap at the price—five dollars a year.—*The Asian, Calcutta, India.*

F. W. Moore, the "butter critic," denies that he said that oleomargarine was fully as good as first-class dairy butter, hut claims that it is equal to second and third-class dairy butter.

THE RIFLE.

At Shell Mound.

Last Sunday the rifle match between P. D. Linville, P. H. McElhinney and Geo. H. Browu was shot at Shell Mound Park. In the earlier part of the day the fog was so deuse that the bullseyes ou the 200-yard targets could hardly be seen from the stand. Though the atmosphere became clearer and warmer as the day advanced, it was not at any time what could he called even passable, the light varying with every fog drift that rolled in over the range. Bnt notwithstanding all the drawhacks the marksmen banged away through thick and thin, for they were shooting for a purse of $60, as well as for glory. The following shows who won the money and who did not:

Geo. H. Brown	4 4 5 4 5 5 4 4 4 4—44 5 4 4 4 4 4 4 4 5 4 5—43 4 4 5 4 4 4 5 4 5 5 4—43 5 5 4 4 4 5 4 5 5 4—45 5 4 5 4 4 4 4 3 4 4—41 4 4 4 4 4 4 4 4 5 5 4—42 5 4 4 5 5 4 5 5 4 4—45 4 4 4 4 4 4 4 4 5 5 4—42 4 4 5 5 4 4 5 4 4 4—43 4 4 4 4 4 4 4 4 4 4 5—41

There was no second money, aud so Mr. Browu's score of 428 won the purse.

Two and Two.

Last Sunday a shooting match came off at Shell Mound Park among four of the members of Company C, Second Artillery Regiment, for a little purse large euough to make it interesting. Two men shot together as partners against the other two. As elsewhere mentioned in this number, the day was not of the best for rifle shooting, owing to the heavy fog and varying light. Mr Kuhls and Mr. Mangels shot against Mr. Haake and Mr. Lemke, resulting in the first two wiuning by nine points. Following are the scores:

Fred Kuhls	4 5 4 4 5 4 4 5 5 5—45 5 5 4 4 4 5 5 5 4 4—45 4 4 4 3 4 5 4 4 4 4—40 4 4 5 5 4 4 4 4 4 4—42	172

Sergt. O. Lemke	4 4 4 4 4 4 4 3 4 4—39 4 4 4 4 5 4 4 5 4 4—42 5 5 4 4 3 4 4 4 4 4—41 5 4 4 4 5 4 4 4 4 3—42	164
Total		326

There will be a rifle and pistol match to-day at the Shell Monnd range in which Col. H. S. Beaver, P. D. Linville and H. Carr will try to decide who of the three is the best shot with the two above named firearms. Fifty shots with each weapon, the rifle at 200 and the pistol at 33⅓ yards, will be shot. These mixed matches are becoming quite popular.

ANCIENT AND MODERN ARMS.

On the Turn of the Rifling and the Influence of the Caliber on the Twist.

BY DR. E. H. PARDEE.

(Continued from page 43.)

Every part of the surface of a projectile, in motion, it matters not what it may he, a comet, the planets on their perpetual march, a Chinese torpedo, or rocket, javelin, arrow, ship or bullet, the laws of dynamics or bodies in motion will describe the eud of a lever, the fulcrum of which is situated in the projectile's center of gravity.

The atmospheric resistance is constantly at work; like the water, always trying to find its level, the heavy end of the hullet is trying to travel on the point, which gives it an unsteady flight, and this unsteadiness is constantly augmeuted until the projectile is in a vertical position, or at right angles to the line of flight. The time uecessary for the accomplishment of upset or summersault of the bullet must depend npon the length of the levers at the end of which it acts, and upon the angles at which it presses agaiust such levers as determined by the positions of the points, and by the general contour aud shape of the projectile.

Thus it will be clearly seen that when the velocity of projection is small, the trajectory of the shot must become more iucnrvated, and consequently high elevations necessarily follow low velocities, in which case, as a naturalj result, the time of flight must be extended, both of which circumstances call for an increase of the turn of the rifling in the gun.

The more clearly to illustrate the application of the above: Let us take rifled projectiles fired from mortars, which to make them practicable would, as a rule, require moderate and even low velocities; hut to accomplish this principle in dyuamics, a rapid turn will he called for, because of the high elevation at which they must be fired to enable them to hold an equilihrinm and maintain the steadiness of flight to the full extent of their range; for it must be an admitted fact that the projectile has lost its greatest velocity soon after passing the vertex of the curve of flight, and as it slows up the attraction of gravity will have a longer space of time to pull the shot to a vertical line of its flight, and whicb will be accelerated in a philosophical ratio of all falling hodies when nearly assuming a vertical position, while as a natural result, the rotary movement will continually decrease.

With guns of large caliber, the greatest range at low elevations, with the force of impact being duly considered, it seems necessary to make one of the greatest possible projectile velocities, for this reasou: As the attraction of gravity is equal on bodies whether in a state of inertia or moving, it must follow, as a parity of reasoning, that the sooner the shot is sent to its point of destination, the less time has the gravitating force to act on the shot dnring its flight. But if fired from high elevations the flight of the bullet will not by any means be so accurate as that of a long shot fired with a greater turn and greater velocity; nor can we expect that the high clevation will he so good.

This results both from the better sustained velocity of the longer projectile, aud from the fact that when the turn is snfficient to keep the shot steady throughout its flight, the surface exposed to the direct impediment of the air becomes greater in proportion as its flight becomes unsteady; and this not only results in unsteady flight of the shot, but as a natnral consequence uses the projectile velocity with useless expenditure of means.

This brings me facing the important question, that appeared to me for years almost metaphysical, (and I havo the candor to say that there appears to be a little dnst on tbe object glass of my telescope at the present writing,) on the manner in which a diffcrence in the caliber infinences the turn of the rifling, and I flonnder around in the treatment of this subject, like an old plunger, at sea without compass or rudder, and, like the watchful captain, who patiently waited for the first pause in the storm, the first glance of the sun wherehy he could take bis reckouing and ascertain how far the boisterous waves had driven him from his true course, bnt still the lowering clouds came thick and fast and every timber in his old ship manifested signs of weakness, and at last, like Cæsar when ahont to sink in the debris of a turbulent stream, he imploringly lifted his hands above his head and exclaimed, "Help me; help me, Cassins, or I sink." If after an attempt to solve this caliber problem and I hccome stuck in the mnd, I shall in the uame of mercy beseech the hright stars, not of heaven, hut of earth, to come to my rescne and take a pull at the oar. I call on Col. Kellogg of East Oakland, a geutleman who is as familiar with all the nomenclature of modern gunnery as he is with the teu commandments God gave to man, a man who by long experience in the manipulation of the rifle, must necessarily have a head well stored with theory; as theory and practice are bound hy immutahle laws, the former acting as precepter for the latter until a state of appreciating perfection is estahlished. And a more systematic man than the Col. never placed his finger on the trigger of a gun, a fact conceded by all who know him. Como out, Col., and do not keep your light that ought to be disseminated over the whole earth, longer nnder a measure. The next star is Col. Burns of San Francisco, a man who has mannfactured more leadeu hullets without system or theory than any other man in the whole world, who is always willing to take chances solely for the excitement there is in it.

So, my dear Burns, come to my relief and tell what you can from scribe rule, a rule that you must understand after two score of years practicing it.

The next star is Col. Frank G. Edwards, a man who will leave his dinner or his business anytime to joiu a few friends in target practice.

So, my dear Frank, the Breeder and Sportsman will be glad to typo your experience, "on the manner in which a difference in the caliber influences the turn of the rifling."

Tho text of this snbject is one that our best commentators disagree upon and I am forced to rely much on theory in establishing tbe few remarks that I will offer, which are borne out by experiments as far as I havo had the time and opportunity to establish my deductions. Capt. Beauford, a French mathematician, says in rifling cannon two methods appear to have heen favorably received, one consisting in giving the grooves a length of turn of ahont the same nnmber of calibers as in a rifle carrying an ounce ball, the other in giving them a turn of scarcely greater length than that nsed for small arms. But I have looked in vain for any philosophical reason in either proposition and I must confess that my comprehension is too hlunt to see the analogy as laid down in the proposition.

The advocates of these methods appear to overlook the fact of the circumstances attending the projection of the shot; the resistance of the air, the time of flight, range, velocity, etc., must all be in a different ratio to each other, with a gun of large caliber from what they are in one of small caliber, and the difference therefore must be recognized and duly considered. There are those whose authority is recognized, who assert that the length of the turn should depend, in some measure, npon the length of the gun; that a more rapid turn of the rifling is required in a short than in a long gun, a proposition that has as little sense as theory, and I am at a loss to think how so unfounded a method could have heen so long in circulation without being refnted, for I have heard it ever since I was a boy, and for two score years looked npon it as a fixed principle in the laws of gunnery; probably from the fact that a lie often repeated would answer as well as the truth.

It is plainly to he seen that if tho shot would acquire a sufficient rotary velocity when fired from a long gun, with a less turn, it would not require a greater when fired from a short gun, therefore the length of turn must depend alone upon the rotary velocity required for the shot, and the comparative turn of the shots which differ in size only, will depend entirely upon the comparative influence of the air upon them. It is a principle in gunnery which none will deny, that the velocity of projection heing the same, large shots have a longer range than small ones, *coeteres paribus.*

Robins in his "Facts on Gunnery," written more than a century ago, can be republished for to-day, and to-morrow, and like the Gordian knot, the longer it remains the more fixed it will become, hecauso the principle is correct. Mr. Robins says: "A 24-pounder loaded in the cnstomary way, aud elevated to eight degrees, ranges its hullet at a medinm to about a mile and a half; whereas a 3-pounder, which is half the diameter, will, in the same circumstances, range hnt little more than a mile; and the same holds true in the other angles of elevation, though indeed, the more considerable the angle of elevation, the greater is the inequality of the ranges. Now this diversity in the range of unequal bullets cannot be imputed to any difference in their velocity, since, when loaded alike, they are all of them discharged with nearly the same celerity; hut it is to be altogether ascribed to the different resistance they undergo during their flight through the air, for, though a shot eight times the weight of another has four time the resistance, yet, as it has eight times the solidity, the whole retarding force which arises from the comparison of the resistance with the matter to be moved will he bnt half as much in the large shot, and thus it will always happen (whatever be the size of the shot) that the retarding force of the air on the lesser shot will be greater thau the retarding force on the larger, in the same proportion as tho diameter of the larger shot is greater than the diameter of the lesser."

Therefore if Mr. Rohins' theory is correct, and who can doubt it, all we have to do is to consider in rifling guns of large caliber in what manner the relativo increase in the weight and size of shot will affect the turn, this being really the only point on which those projectiles of the same form and density will differ. And as the resistance of the air is the main cause wbich renders tbe rifling necessary, whatever tends to lessen this resistance, or its effect on the shot, will allow a corresponding diminution to be made in the velocity of the shot's rotation.

There would be no necessity for a long projectile to have a rotary motion in a perfect, or as near perfect as possible, vacuum; still, the shot might turn over in its projectile velocity, but even that wonld only he atteuded with injurious effect, both in its velocity and direction.

The performance of the gun would be equally as accurate, whether it was rifled or a smoothhore; the rifling would be called for in order that the shot might have a security of keeping one end foremost, but as thero wonld be no resistance from atmospheric pressnre a very slight rotation imparted to the shot would suffice. But if the shot was ronnd it would not require any rotation at all, for it is only the resistance of the air affecting the shot in an oblique direction, in consequence of the rotation of such shot about an nncertain axis, whicb causes the deflection, most snrely to be observed hy the experienced marksman.

In making the estimate of the amonnt of the resistance of the air acting on the shots of different diameters, I find it is a common mistake by many, who take into consideration tho action of the air's resistance upon the projectile at the time, or about the time of its initial velocity; or, to state the proposition in this light, which is advocated by able writers, that a shot double the diameter of another, therefore only possessing half the area of surface, when compared with its weight, will, hy a source of reasoning, only meet with half the atmospheric resistance. While, at first thought, thero appears to he an analogy in tho above proposition, in tracing the snbject to a final result the facts will not hear out any such conclnsion. We will take two shots similar in form and density, the diameter of one being double that of the other, and fired from a gun, under similar circumstances, with tho same initial velocity. Thus it will bo seen that at the very start of projection the atmospheric resistance on the larger shot will he four times that on the smaller. From this finding it will readily he seen that the velocity of the larger shot will be maintained for a longer time, so that its flight will be constantly augmented beyond that of tbe smaller, and necessarily tbe resistance of the air will be more than four times as great; or, in other words, the total resistance of the air will relatively he more thau one-half greater than what it is on the smaller, and consequently not in pro rata to the difference of their densities, weights and snrfaces, so tbat, if the angular velocity or turn of the rifling were reduced one-half in a shot twice the diameter of another it would not be snfficient to meet the additional resistance arising from tho greater mean velocity of tbo larger shot, for tho *vis viva* of rotation would not be in the same proportion to the *vis viva* of translation, or to tho resistance of the air, in the larger as in the smaller shot. Should we make tho turn of the ratio of the diameter of the bore, or of the same length in caliber, tbe rotary impetus is in proportion neither to the quantities of motion nor to the quantities of resistance to the shots of different sizes; nor does it secure an equal stability to each.

I can conceive of no theory by which this problem can be settled, or approximately settled, only by a series of experiments and mathematical deductions; and I now believe tbat tho proper degree of rotary velocity which should be given to shots of different sizes, but of tho same form and density, comes near a mathematical deduction resulting as the squaro roots of their diameters.

Nearly 3,000 patents havo been issued on improvements in go-carts.

JOSEPH CAIRN SIMPSON, - - - EDITOR

ADVERTISING RATES.—Displayed $1 50 per inch each insertion or pro rata for less pace. Reading Notices set in brevier type and having no foot marks, 30 cents per line each insertion. Lines will average ten words. A discount of 10 per cent. will be allowed on 3 months, 20 per cent. on 6 months and 50 per cent. on 12 months contracts. No extra rate charged for cuts or cutting of column rules. No reading notice take for less than 60 cents each insertion.

San Francisco, Saturday, February 3, 1883.

SACRAMENTO AGENCY.

Residents of Sacramento and vicinity, desiring to subscribe, or advertise in the *Breeder and Sportsman*, can do so through our agent, Mr. M. J. Henley, Russ House, 1009 J street.

POULTRY.

The queries of G. S. B. were referred to a gentleman of whom it is safe to say that no one excels him in the breeding and rearing of poultry, and we are not only pleased to give his answers to the questions propounded, but still more so by being able to announce that hereafter he will be a contributor to this department.

He is as enthusiastic in regard to his gallinaceous pets, as we are in whatever pertains to the horse, especially those of high breeding. And by this we mean all classes of horses. There is high breeding in one sense in the cart horse, viz., a scientific endeavor to improve the race for the purpose intended.

There must be enthusiasm to excel in any department of stock or poultry breeding. An enthusiasm that will not cool over many failures and numberless "set-backs." There may be twenty experiments all, perhaps, entailing comparative failures, the twenty-first may make amends for all losses previously incurred.

We have quite a fancy for chickens though the "game" is the especial favorite.

The head of this department at home is quite actively engaged in the pursuit, and in addition to all the chickens and eggs required in a family of never less than six adults, she gives away quite a number, in order to keep the supply within bounds. We have a game-cock that was sent us with a couple of pullets from Palo Alto. Previous to his arrival we had a pair from El Arroyo of the strain that Captain Moore brought here. These have been mixed with the various breeds and advantageously, too, judging from the greater success than our neighbors have.

The Palo Alto bird is the handsomest fowl we ever saw. A black-red but with a sheen in his plumage we never saw equaled, and his form the perfection of beauty. He is as graceful as was Taglioni, and whether it was the boyish enthusiasm that pictures things of that kind in such gorgeous hues, the remembrance of forty years is still as vivid as when we saw her. It may be thought a queer comparison but the fowl has much of the same kind of airy grace, a demeanor which is also as stately as a Grand Duchess, and at the same time a look which carries the import of the motto "Wha dar Meddle wi' me." Another present was not so fortunate. That was one of these frizzled fellows with the feathers not only sticking the wrong way, but bent forward in a curve. When the moulting season came he lost his covering completly, excepting a few stubbed quills on the ends of the wings. The sun burned his skin to a dull red, and his comb was as fiery as a glowing iron just drawn from the forge. When anyone looked at him he would stand as erect as a dandy, apparently conscious that he was more than an ordinary attraction. The queerest-looking biped ever seen, and sure to evoke laughter in those who saw him. He was as impudent as grotesque. But a few pullets donning the peculiar garb led to his doom, and when away from home the chief of the coops and roosts sent him into exile.

THE AGRICULTURAL PAVILION.

Speaker La Rue called Campbell to the chair this morning, when the bill appropriating $40,000 for a state agricultural pavilion in the Capitol grounds came up for consideration. This bill is Mr. La Rue's pet, and the young members just for the fun of the thing, apparently—Leverson out of earnest honesty, and Johnston out of—well La Rue beat Johnston for the speakership—turned in and worried the old gentleman considerably. The pavilion will be built back of the Capitol, but the persons I have designated intend that La Rue shall get down from the chair and show how well he can fight every time the bill is mentioned in the Assembly.

Johnston offered an amendment this morning striking out the words "in the state Capitol grounds" (as the place where the pavilion shall be built) and inserting "Golden Gate Park." Campbell decided the amendment out of order, and Weaver moved to amend by striking out the same and inserting "Agricultural Park" (Sacramento), which was also declared out of order by Campbell. The decision was appealed from and the chair was sustained, though manifestly in wrong. Leverson spoke against the principle of the bill, and opposed it as establishing a bad precedent. All this and much more kept La Rue busy and anxious, and thus accomplished what most of the opposition appeared good-natredly satisfied with. Of course, Mr. La Rue knows as well as, if not better than any one else in the Senate that if Sacramento wants a pavilion to show goods and produce in to attract people to the city during the fair time, she will build it, and has no more right to expect $40,000 state aid than the Mechanics' Institute. Still, it's only $40,000, and the grangers want it, and it will be nice for the orators of the day to come to deliver fat-hog-and-proddy-pumpkin addresses in to admiring throngs. With this good-natured view the bill will go through, and the fair expanse of lawns, pretty patches of bright flowers, graveled walks, shaded drives and grassy terraces, which were to be in the grounds back of the Capitol, will give way in the picture to a big pavilion with its inevitable fringe of greasy machinery, patent quartz-crushers and brick-red farm-wagons—all of which will be as satisfactory, if not more so, to the average beholder.

After recess the bill was debated another hour, and at three o'clock was passed to its third reading and engrossment by a vote of thirty-nine to twenty-seven.

The above is copied from a daily morning paper, being a portion of the report of the doings of the Legislature on Tuesday last. Whoever wrote it is certainly ignorant of the question, and his criticisms have not the semblance of foundation to build upon. It is not the purpose of the bill to grant a pavilion "to show goods and produce in to attract people to the city (Sacramento) during fair time," but a benefit to the whole State, which in a few years will ten times repay the appropriation. Neither is it the same as voting that amount to the Mechanics' Institute. That is a partnership concern, where the profits go to the stockholders, while the State Agricultural Society is a part of the commonwealth, as well worthy of State aid as anything which is assisted by the donation of public funds. Few of them, indeed, make such a handsome return as results from the yearly exhibitions. The benefit is not restricted to one class, as the strictures imply. There is not an inhabitant of California, save, perhaps, those who are domiciled in San Quentin, Folsom or kindred institutions, who is not a gainer, either directly, as the agriculturist, stock breeder, mechanic, merchant, etc., or indirectly, through the greater prosperity that follows the practical teachings. As an educator, there is nothing so potent. The week of the fair presents lessons that could not be obtained in months if the pupil had to seek the information through other sources than the State and District fairs afford. These give the opportunity for comparison, for becoming acquainted with the management, the systems and the way the successful farmer, mechanic and artisan have followed to make the improvements that are manifest. They incite a feeling of emulation, a determination to pursue the improved methods, so palpable to their understanding, and return from the visit with a fund of acquired knowledge to put into practice. It may do for a pert reporter who wields a handy pen to sneer at that which is beyond his understanding, and to rail at "greasy machinery, patent quartz crushers and brick-red farm wagons," though it may be well for him to remember that in these, and the other articles on exhibition, lie the wealth of the State. Those who have lived years enough to see what the fairs of the country have accomplished are well aware, however, of the great results that have followed, and fortunately there is a majority of this kind to sustain their representatives in voting for this bill. Apart from the exhibition of domestic animals there are immense interests that are fostered by the fairs. These demand a building which will furnish a proper display, and enable this display be located where the greatest number can witness it. The daytime is occupied with the sight-seeing at the park, and the amendment to erect the proposed structure there would be a serious detriment. It must be within a convenient distance of the centers where the visitors are housed, accessible, of sufficient size for proper arrangement and to give the throngs who will visit it the chance to see without over-crowding. Should the sight of an utterly-inclined æsthete be shocked by a "brick-red wagon," he can turn aside and restrict the vision of his eyeglass to the departments where the greasy machinery does not find a place. It will be an ornament to the capitol grounds, for doubtless architectural skill will be invoked to give it harmony of proportion and beauty in detail. The "fat-hog-and-proddy-pumpkin addresses" are beyond our comprehension, as we cannot imagine what sort are thus named. But the lives of the intelligent farmer, the skilful mechanic, the busy artisan are replete with material for a true orator to enchain his auditors, and it is eminently proper that there be a temple worthy of the theme.

The State Fair of California surpasses any exhibition of annual occurrence in the United States. It is the most complete in all of its departments, and could it be transported to any of the Eastern cities a million spectators would congregate to witness it. It is not only an educator of our own people. It brings before the visitor from other states the manifold and rich resources of this wonderful country in a way that compels admiration, and the truth of the stories, which were regarded as freaks of a feverish imagination, is too positive to be denied, carrying conviction that volumes of statistics would fail to accomplish. Wipe out the State and District fairs, abrogate the aid that is given to the vineyardist and fruitgrower, cut off the expenditure for the Agricultural College, and it will not be many years before there is a retrogression that will lessen the revenues of each year more than ten times as much as the annual appropriation for these objects. They are so essential to the continued prosperity of the people of California that the loss would be calamitous, involving every interest in the downfall.

Doubtless a good deal of the opposition to the passage of the bill arises from a desire to annoy the citizens of Sacramento. The mover of the amendment to locate the pavilion in Golden Gate Park may have been influenced by such a feeling. We sincerely hope he has better grounds than the motive the reporter ascribes. In either case he has given proof that the selection of the present speaker was a wise choice. It would be worse than folly to remove the State fair from the present location—a blunder that would be a severe blow to the interests depending. Next to the unrivaled resources of this country the success of the State fair is due to its being permanently established at one point. In those States where it is a peripatetic institution, (and this is the general plan in the East) there is comparative failure. Places enter into violent competition to secure the location, and offers are made, the acceptance of which leads to extortion. Being temporary all the adjuncts are frail. The accommodations for visitors, unless some large city is the site selected, are miserable, and there is a repellant force that drives away those who have not pressing business to attend to or do not live in the neighborhood. Every move to add to the permanent localization of the State fair is a direct aid to the fairs of the different districts. This is so manifestly true that there is no necessity for occupying space in presenting arguments. It has flourished, and the district fairs have kept pace with it, and now there are several which are scarcely behind it in attractions. At Stockton, Oakland, Petaluma, San Jose, Los Angeles, Chico and other places, are yearly exhibitions of great excellence, far beyond those of the East. In fact there are only a few of the State institutions of the Orient that will compare with our district exhibitions, and in many respects they are far inferior.

This is a political question that comes within the legitimate sphere of this journal. It is not a party issue, nor a question that has a limited bearing. Those who are badgering Mr. La Rue "for the fun of the thing," are not taking a course that will add to their credit though this view may also be incorrect. We have no fear that Mr. La Rue will shirk the fight, and have the utmost confidence that the vote on the final passage will show an increased majority. The more discussion there is the clearer will be the appreciation of the benefits that will follow.

Notwithstanding the "Granger" interest is the most prominent, the support of the farmers is evidence that it is proper to make it a law. When this interest is also in harmony with others of great magnitude there cannot be a question that it is the duty of legislators to vote in accordance with the wishes of so large a majority of their constituents.

GREAT SALE OF TROTTING STOCK.

On the 28th of February there will be offered for sale at the Oakland Trotting Park by Killip & Co. a lot of high bred trotting broodmares, stallions and other horse stock, the property of the estate of Daniel Cook. The advertisement came in just in time for this week's issue, so that an appropriate notice will have to be deferred until next week.

GOODWIN'S TURF GUIDE.

This very neatly gotten up calendar has come to hand, but at too late a date to notice this week. In the next issue we will give it attention.

THE 2:25 HORSES.

A list of the horses which have trotted in 2:25 or better was published in the New York *Spirit of the Times* of January 6th.

There are thirty-seven which were hred in California, and this must be acknowledged to be a very good exhibition for a state that has so recently engaged in the business of breeding trotters. Although there were a great many sires and dams of the most popular strains hrought here in the early days there were no pains taken to educate them until the last decade, and though the hlood is of great benefit the grand showing is of recent date. At the head of the column is Occident, and he is not only the fastest but has more of the California blood than any of the others. His sire Doc was bred here, and on the side of the dam there is scarcely a question that they were natives for many generations, and date back to the founding of the Missions. His record of 2:16¾ was made at Sacramento, September 13, 1873, and at that time was the fastest in the calendar. Col. Lewis by Rifleman comes next with 2:18½, and then Graves by Whipple's Hambletonian 2:19, Romero by A. W. Richmond, five years old, 2:19½, Nelly R by General McLellan Jr. 2:20, Overman by Elmo 2:20, Sam Purdy by Geo. M. Patchen Jr. 2:20½, Doty hy Challenge 2:21, Wildflower—two years old—by Electioneer 2:21, Ewing by Primus 2:21½, Albert W, four years, by Electioneer 2:22, Oakland Maid hy Speculation 2:22, Starr King by Geo. M. Patchen Jr. 2:22, Vanderlynn by Geo. M. Patchen Jr. 2:22, Gibraltar hy Echo 2:22¼, Reliance hy Alexander 2:22½, Sweetheart, three years, by Sultan 2:22½, Belle Echo, four years, by Echo 2:23¼, Echora by Echo 2:23¼, Dan Voorhies by General McLellan 2:23¼, Nerea by John Nelson 2:23¼, Abe Edington hy Stockbridge Chief Jr. 2:23¾, Ashley hy Plumas 2:23¾, Crown Point by Speculation 2:24, Defiance hy Chieftain 2:24, Del Sur by The Moor 2:24, Empress by Whipple's Hambletonian 2:24, Magdallah by Primus 2:24, Manon, five years, by Nutwood 2:24, May Howard by Paddy McGee 2:24, Tommy Dodd by Alexander 2:24, Tommy Gates by The Moor 2:24, Bonita, two years, hy Electioneer 2:24¼, Louis D by King William 2:24¾, Gold Note hy Contraband 2:25, Pat Hunt by Tecumseh 2:25 and Poscora Hayward by Billy Hayward 2:25. There are many others which have come very close to 2:25, and to include those who have trotted in 2:30 or faster the list will present an array fully commensurate with the records of any other state when due allowance is made for the difference in the conditions. To take the supreme test of 2:20 or better, the ground for satisfaction is still on a good basis. Four in the teens, and these by horses which are still alive, with the exception of Doc, although the trio of sires cannot he expected to live many more years. Rifleman is twenty-eight, Whipple's Hamhletonian twenty-two and A. W. Richmond twenty-one. In the 2:25 Electioneer, Echo and Geo. M. Patchen Jr., have each three, Speculation, Whipple's Hambletonian, Alexander, The Moor and Primus each two and the eighteen others single representatives. We have the utmost confidence that in the future there will he a still grander display, and the decade which will end in '92, put a large number of California-bred trotters well down in the teens. More than that, as we anticipate by that time, or, at least, within the present century, that the "top-notch" will be to the credit of the Golden Coast. This may appear an over-sanguine prediction, so super-extra optimistical as to be only thought worthy of ridicule. It was held the height of folly to make a similar prediction in regard to the prophecy that augured the place the California colts have taken, and this has the same good foundation for the vaticination. We also believe that the "top-notch" will he occupied by a colt that has been educated from the time it is weaned, and that the animal which will he on the summit of the pyramid when the twentieth century is reached, will be full of the blood of the thoroughhred. A granddaughter of a blue-blood now holds the fort, and the horse that many think is destined to dethrone her is the grandson of a thoroughbred mare.

"KRIK'S GUIDE."

Again this capital synopsis of turf events makes its annual appearance and again it is complete and indispensable to those who have a fondness for the sport. Turf associations, hreeders, those who attend the races, are under obligations to the author, an obligation that appears not to be properly valued and the merits of the work appreciated as it should.

Next to Col. S. D. Bruce H. G. Crickmore occupies a position beyond all other men in this country. The former has pnt the pedigrees of blood stock into shape, rescued from loss lines of hlood and families which were fast fading into oblivion, brought order out of chaos, and in many instances quadrupled the value of animals which, without his aid would have rested under the imputation of being "cocktails." The "American Stud Book" placed the breeding of American thoroughbreds on a sound and substantial foundation. But in order that the breeder should keep up with the march of events it was nearly as necessary that there should be a comprehensive compilation of the results. The "Stud Book" furnished the lines in the genealogy, the "Guide" established what had followed from the union. With its aid it became an easy task to make comparisons; without it, the only source of information would be files of papers covering years, and the labor so great that no one would undertake to unravel the skein. Turf journalists are well aware of the difficulty there is to give the performances of any other than those of the first celebrity which figured in the contests before the date of the "Turf Guides." At that time, too, there were a few running in comparison with the racehorses of the present, and the race meetings were still more meager. Even in the old halcyon days of the turf, a first-class meeting at the furthest was five days with two races on each day, and it was a "big stable" that coutained six animals in training. Now there are a hundred days' racing at one course, weeks at another, and hundreds of racers assemble at the various courses. The calendar of Mr. Crickmore has been as complete as it was possible to make it, and this required an amount of labor that would astonish those who look at the volumes. It reqnires a peculiar faculty, or rather a rare combination of faculties, to accomplish it with any degree of accuracy. Untiring industry, system, perspicuity, and above all a fondness for the racehorse, and an enthusiastic temperament that surmounts every obstacle. All these qualities Mr. Crickmore has in an eminent degree, and had it been otherwise the "Guide" would not have survived. As the case stands there must be a more liheral support than has been awarded in the past or even the "game" of the author will not endure the strain, and with no better encouragement than heretofore has heen given the grand work will come to a close. We sincerely hope that the turfmen of the Pacific Coast will take more interest than they have heretofore and send in their orders to Mr. Crickmore.

A few extra copies will give them the opportunity of increasing the knowledge of their trainers, grooms and jockeys. A present of this little volume to a stable lad will he an incentive to increased usefulness, and their spare time will be hetter employed in hecoming acquainted with the pedigrees and performances of the winners, than in loafing around.

Send orders to H. G. Crickmore, the *World*, No. 31 and 32 Park Row, N. Y. Price per copy, $2 50.

It is unnecessary to tell in detail what the work is—Racing in the United States, Canada, and the performances of American-hred horses in foreign countries, all so admirably arranged that a few minutes' search will give the information desired. We have not the least hesitation in saying that once aware of the merits of "The Guide" it would not be relinquished for ten times the cost.

EDITORIAL NOTES.

Mr. Henry G. Langley, Secretary of the Pacific Yacht Club, died at his residence in this city this week, in the sixty-fifth year of his age. By the death of Mr. Langley, the club loses its most valuable member. To his energy and persistence the clnb owes its standing more than to any other man. After leaving the San Francisco Yacht Club, of which he was Secretary for several years, he, with several others who withdrew at the same time, proceeded to organze the Pacific Yacht Clnb. He was the prime mover in the matter and it was chiefly dne to his execntive ability that snch rapid progress was made in the collection of moneys, bailding of yacht club houses, obtaining of members, etc. Mr. Langley was enthusiastic on yachtiug matters and has always been prominently identified with them here. Strange to say, however, he was no sailor, could not handle a yacht nnder sail and knew nothing of the technicalities, neither did he preteud to, as many do. Of an eminently social disposition, however, and willing to nse his best efforts to bnild np his clnb, he did a deal of hard work for the yachting interests. He was self-sacrificing in this, doing work for others' pleasnre. In organizing a reception or any festive occasion at the club house, Mr. Langley was at his best, mastering all the details in a very successful manner. As he was always willing to forego his own pleasure for the amusement of others, a great deal fell on his shonlders that others might have done. A jovial companion, of genial nature and pleasant manners, Mr. Langley will be greatly missed by his associates. In the club his place can never be filled for his enthusiasm was unbounded and his energy only ceased with his death.

Messrs. Hill & Gries of Ventura county, who lately added A. W. Richmond to their trotting stnd, have some thoroughbreds in training for the spring meeting of the Blood Horse Association. The string consists of Wildidler by Wildidle—Eva Coombs; Phœbe Hall, three years, by Joe Dauiels—Mary Wade by Woodbnrn; Nettie Hill, two years, by Joe Daniels—Mary Wade; and Bachelor, two years, by Hockhocking—Maid of the Mist by Norfolk. The horses are in charge of Dan Sheehan.

ATHLETICS.

Jakie Howell Defended.

Editor Breeder and Sportsman: I was much amnsed in reading in yonr paper of the 27th inst. the story entitled "Pat Lyman's Merced Foot Race." This was the first foot race I had ever witnessed, and although I stood at a distance of several hnndred yards from the scene of action I enjoyed the novel sight and laughed heartily. It was too funny, and I langhed for many weeks afterwards whenever I though of the ridiculous sight of that fat man with Jakie Howell npon his hroad shonlders skinning over the grond like a feather. But really Mr. Lyman does the young man a great injustice when he accuses him of treachery. Jakie is the sonl of houor, depend upon it. There was no treachery in that hng. There is uot money enough in Merced to hire that young man to do a dishonest or treacherons act. Neither are there knives, pistols or hulldogs enoagh to frighten him into throwiag off on a race. No; that embrace he gave Lyman only meant: "Be careful; I'm a sort of a pet in the family."

Merced, Jan. 28, 1883. Nat.

A Challenge.

The parties anthorized by John Meagher to make a match for him in England being too slow in attending to the matter, he has forwarded the following challenge to the *Sporting Life:*

Dear Sir: As it will be impossible for me to visit England as contemplated nnless I am assnred of making a match with the principal English pedestrians, I hereby challenge any man in the world to walk me from 10 to 50 miles for $1,000 to $2,500 a side, preferring Thatcher, Griffin, Hancock or Hibberd. I will allow either of them $150 expenses if they will make a match to meet me in America.

John Meagher.

Lawrence, Mass., Jan. 11, 1883.

George Mason was the winner of Sir John Ashley's challenge belt and $300 in a six-day (twelve honrs per day) go-as-yon-please race at Drill Hall, Sheffield, England, closing Dec. 30. He completed the greatest distance (73 miles 12 laps) ever run on the fonrth day of snch an event, and his total distance for the fifth day beat the previons best record. George Littlewood was among the beaten lot, which inclnded Corbett, Day, Jones, McCarthy, Cartwright and Pierce (colored). The distance completed hy the leader at the close of the fifth day was 359 miles 3 laps, which was nearly fonr miles in advance of Littlewood's record. The final scores were: Mason, 398 miles 3 laps; Littlewood, 370 miles 2 laps; Corbett, 340 miles 4 laps; Day, 323 miles 5 laps; Jones, 314 miles 7 laps; McCarthy, 306 miles 1 lap; Pierce, 298 miles 8 laps.

The Pacific Coast is threatened with an invasion. Jim Elliott, pugilist, Fred Plaested, oarsman, Ed Johuson, athlete, announce their intention of starting on a starring tonr across the continent to San Francisco nnder the management of Charles E. Davis.

It is said that the National Association of Amatenr Athletes intend to publish a sporting weekly paper, to be the official organ of that association, and that Mr. L. E. Myers, the amatenr champion runner, will be editor in chief.

Homer Lane, the veteran wrestler, was in Colorado at last accounts.

POULTRY.

Poultry in California.

Editor Breeder and Sportsman: Please answer the followiug qnestions:

1. Are chickens easily reared in California, or is there something in the climate that makes their cultivation hazardous?

2. Can corn be raised in any portion of the State? If so, please state the locality?

3. Is the demand for prime ponltry equal, at all times, to the supply? G. S. B.

Tiskilwa, Ill., Jan. 20, 1883.

Having referred these qneries to a gentleman of great experience in poultry raising he has indited the following replies:

Editor Breeder and Sportsman: It is evident that your correspoudent has already received information regarding poultry in California which has raised donbts (aud possibly uone too grave) as to the profitable production of chickens here, as a general propositiou. California-raised chickeus are, as a rule, certaiuly less vigorous than Eastern-raised, and they are also snbject to troubles scarcely heard of east of the Mississippi, some of which are difficult to uame eveu. Yet there is a wide range in the degrees of success amoug poultry raisers here, and remarkably fine specimens of table birds and prolific layers are not ancommon even in considerable numbers at a yard, proving, in our estimation, that with proper devotion to the business a reasouable degree of success may be attained at some seasons at least. Bat no man should hope to succeed here offhand upon the strength of an Easteru experieuce alone; the business, like the fowls, is quite a different thing. Our chickeus are at their worst at the end of the long, dry season, at which time they can scarcely be deemed profitable, either as layers or for the market. I believe that this particular seasou, and not onr general climate, is responsible in most part for the difficnlties onr poaltry people encounter, both as regards young chicks and older fowls; and I also believe that poultry in Califoraia could be much improved in vigor aud geueral excellence were we to keep our stock no more than oue year, breeding ouly in the very early spring months (uot later than March), and artificial iucubators are now advantageously used for this purpose, before the hens become "broody." Considerable atteution has of late been given to artificial hatching and rearing for market.

The demand for poultry is as capricioas, of course, as the greatly varying seasons. In the summer of each year, for a season of, say, five months, the market is liherally, I may almost say too well supplied with most varieties, to maintaiu prices that would leave a remunerative margin on an exclusive poultry-growiag husiness. At all other times fair prices cau be obtaiued.

California cannot he said to be a good corn-prodncing State, as compared with the section of country your correspondent writes from, yet much is raised here iu many localities. G. E. D.

East Oakland, Cal., Feb. 1, 1883.

The Pool Buyer.

To even an inexperienced and not over-zealous student of human nature the crowd that surges around the pool stand during the exciting times of a trotting meeting furnishes an unlimited amount of food for reflection, and of a variety so extensive that the menu of thoughts that crowd themselves upon the mind of a reflective man, who is an interested spectator of pool-box betting, is at once exhaustive and exhausting.

Of pool buyers there are many classes, first among which may, perhaps, be mentioned the "insider," so-called because, in the minds of the lesser lights who seek from him illumination on dark problems of the turf, he is religiously believed to be the custodian of some prominent driver's secrets and that by means of this knowledge he is enabled to put his money on a "dead certainty," whenever he puts it on at all. There are not a great many of this class, but every driver is popularly supposed to have some one friend or backer to whom, first of all, the secrets of the stable must go, and when the tactics under which a certain race is to be driven are decided upon he is the one to whom is intrusted the fateful task of carrying out at the pool box the campaign which, in company with his *fidus achates* in the sulky, has been the subject of much consultation for perhaps a month before the race is trotted. These men do not stand openly in front of the pool box, as others do, and bet their money in such a way that anyone who takes the trouble to stand within sound of their voices for a few minutes may know just what those particular men are doing. Not at all. On the contrary, they are very seldom seen in the betting stands, but in lieu of their presence there is an "order in the box"—that phrase one hears employed so often among those who follow the fortunes of the trotters. An "order in the box" simply means that some person who wishes to bet more than an ordinary sum of money on the result of the race, and does not care to have his intentions heralded to all the world, has told one of the firm which has charge of the pool selling to put a certain amount of money on a certain horse for him. When the man who desires to "place" a sum of money is not so well known to the pool seller that the latter has every confidence in his customer's financial standing and general integrity, the currency to fill the order given is handed over when the conversation takes place, but in most instances a simple memorandum of the transaction is made, and both parties go their respective ways. Then, a short time before the pool selling begins, the member of the firm who has received the order tells his auctioneer to "put on so much for Mr. ——," or if the better does not desire that even the clerks in the pool box shall know how his hand is being played, a purely fictitious name or title is given, to appear later on the pool tickets, such as, "Cash B.," "Double X.," "Chicago John," etc. In cases of this kind, whenever a pool is sold to the individual thus designated, the auctioneer repeats the title in a low voice to the book-writer at his back; but where no concealment is necessary the auctioneer sells the first choice in every pool very rapidly, indeed, and (apparently) to so many different men that the ordinary speculator in pools is rather bewildered at the rapidity of the job. Perhaps one of this class is trying to bet $100 or so on a horse that is first choice in the pools. He bids every time, but invariably finds that some mysterious person in the crowd, whom he can not, for the life of him, identify, has secured the prize he is after. Now the auctioneer nods his head in one direction and announces in clarion tones, "Sold to Mr. Smith," and the next time he will be gazing earnestly in an entirely different direction, and suddenly shout, "Sold to Mr. Jones for $100."

This is how the "men on the inside" bet their money. After the race is ended—that evening at some down-town hotel, most likely—a settlement takes place. The pool seller tells the customer that his money was put in at such and such odds, and should the better wish to verify this statement, the pool books are there for his inspection. But in the long run the "insiders," or "high-rollers," as they are variously known, fare no better than the ill-paid clerk of speculative tendencies, who invests, perhaps, his last five-dollar bill in a French mutual ticket on some horse that he fancies ought to win. They are all eaten up by the fortunes of war and the three or five per cent. commission which keeps grinding away with fearful certainty. Every little while during the trotting season, some "high-roller is 'knocked out,'" as the vulgar parlance has it, and is seen no more until the following season, if at all. Sometimes the "knocking out" is attended with disastrous results to the pool seller, for in betting on horse races, as in every other form of gambling, the unsuccessful man is certain to overplay himself if allowed to do so. A case of this kind, which attracted considerable attention among the turfmen at the time, occurred at Cleveland in the summer of 1879. The gelding Alley, owned by Mr. Alden Goldsmith, had won a very sensational race at Chicago, beating Rose of Washington, Deck Wright, Monroe Chief, Russ Ellis and others, trotting the first heat easily in 2:19. Before the start for this race Alley was absolutely unnoticed in the betting, bringing only two and three dollars in pools of a hundred dollars and over, Rose of Washington being the favorite. Splan was driving the gray mare that season, and three days before the race he had taken her over to the Central Park track at a very early hour in the morning and given her a trial in 2:19¾. As she was known to be a game mare, and one that would act well in a race, this trial was supposed to settle the claims of all the other horses in the race for first money. But the secret leaked out, and by the time the horses were on the track and scoring for the first heat, all the smart men in town knew that Rose was booked to win, and played their money accordingly. The Russ Ellis party were also very confident. They knew their horse could go a mile in 2:20, sure, and were content to put up their currency liberally on that fact. The first heat practically ended the race, as Alley won very easily in 2:19, Russ Ellis right on his wheel, however, showing that the Michigan men had not overrated their horse, while the Rose of Washington was a not very good third.

It was the winning of this race by Alley that led to the catastrophe at Cleveland, alluded to above. There Alley met an entirely fresh lot of horses, Charlie Ford and Lida Bassett being among the number. Ford had won two good races at Chicago, and the delegation that accompanied the horse to Cleveland were very confident there was nothing in his class capable of beating him. With this thought foremost in their minds they backed the grey gelding freely, but all the time Alley was an immense favorite, all the shrewd betting men believing it impossible for him to lose. Foremost among those who backed Mr. Goldsmith's horse was a "high-roller" from Boston, who "plunged" as if the race was over. In every pool Lida Bassett would bring but two or three dollars, and those who took the tickets on her were members of the class euphoniously and correctly known as "suckers." For once the lamb killed the butcher—several butchers, in fact. Charlie Ford made a dead heat in 2:20¾—fast enough to inspire his backers with renewed confidence—but when the sun went down that night Lida Bassett had won the big race of the meeting and the "high-roller" from Boston owed the pool-box $2,000 more than he was able to pay.

But while the big men at the game are sure to go under if they will only play it long enough, it is the little fish, comparatively speaking, that furnish food for the net. Of course moralists will say that a system which works so disastrously to its patrons should be suppressed, but those who have agitated for the suppression of pool selling are, almost without exception, persons whose knowledge concerning the subject is entirely of a second-hand character, and, like most goods of that description, not remarkably serviceable. Every man who has had aught to do with the management of a trotting track knows that without pool selling no meeting can be made a success. Americans are essentially a speculative people, and nowhere is this feeling more strongly demonstrated than on a race-track. Racing without pool selling has been tried, and found a flat failure, and the results of legislative enactment against public betting are aptly demonstrated at Monmouth Park, that, three years ago, was the most popular race-track in the country, and is now almost deserted when a race-day is announced.

Oregon Notes.

For a long time there has been considerable rivalry in Eastern Oregon between the owners of Gen. Sprague, Black Stranger, Dead Shot and Anvil. Lon Remillard, proprietor of the Union track, in order to get the trotters together, offered to add $5,000 to a stake race for these stallions and advertised the conditions that each owner pay $500, of which amount $50 was to be paid Jan. 1, 1883. It now appears that Mr. D. A. McAlister, owner of Dead Shot, was the only man who had the nerve to back the ability of his horse. Of course the race did not fill.

The Oregon State Agricultural Society has recognized the demand for Breeders' Stake races, and has in the programme for this fall announced two trotting stake races, one for two and one for three-year-olds. It is now believed that each race will fill handsomely, so much so that the society will probably get in percentage about all they give in purses or add to stake races.

The *Turf, Field and Farm* reports Capt. Sorenson, the owner of Bellfounder Girl (dead), as being a resident of San Francisco. He is a citizen of Portland and the mare died there. Bellfounder Girl was not sired by old California Bellfounder, but by Milliman's Bellfounder.

The Oregon short-horse men seem to be enjoying themselves this winter. A match race has been made between Horace Dunlap's Little Pilot and Ed Hanley's Billy, which will come off at Phœnix Feb. 10. The race will be for $100 a side, distance 440 yards.

Wm. Galloway, of Bellevue, has sold to Thos. Richmond, of Dallas, dark bay filly Hollybock, 3, by Hambletonian Mambrino; dam Monntain Girl, by the Bear Horse; 2d dam the mother of Leouard's Mac; $250.

Among the late importations is a trotting stallion by Bona Fide, son of Rysdyk's Hambletonian; dam by Volunteer; 2d dam by Alexander's Abdallah; 3d dam by the sire of Ethan Allen.

There was not a single second payment made in the three-year-old Breeders' Stake, which should have been made Jan. 1, 1883. Consequently the first payment is forfeited.

Stockmen on the Malheur rejoice in having plenty of grass and a mild winter. Stock of all kinds are fat and will probably winter without loss.

Neil Hogohoom, of Mt. Vernon, Grant county, will have in training the coming season over a dozen horses.

Reasoning Animals.—We confess that the two points which have always struck our mind as distinguishing the nature of brutes from that of men have been their inability to worship God and to kindle a fire. It would be folly to deny that brutes could reason. A sheep dog who wants to head a flock in a narrow lane will jump over a wall and run along the other side until he has reached the exact point occupied by the sheep at the head of the flock, and then jump back in order to drive them home. A colley, who was fond of going out with a carriage, would go and hide himself as soon as he heard the order for the carriage given, so that he might not be tied up. If we analyze these and many other instances of sagacity, we cannot help admitting that a brute's mind is capable of two or three steps of reasoning. On the other hand, no animal ever manufactured a tool or weapon, even of the simplest kind; and it is doubtful whether a gorilla himself, supposed to be our nearest neighbor, uses a walking cane.—*London Spectator.*

The horse is required to show life and willingness to travel when out of the stall, hence there are certain attentions required in the feeding that his body may be supple and his spirits lively. The horse fed freely on corn will not be in fit condition for active driving. In popular language, corn is said to be heating, and it has a tendency to produce indigestion. As the horse with confined bowels is necessarily spiritless, the stable should be at all times provided with bran and oil cake, that by judicious use of these the bowels may be kept in just the right state—not loose, for this is debilitating. If the horse is expected to go fast for a short distance, to pull a heavy load, or make a day's drive with comfort and safety to himself, no large amount of hay should be given. The same rule of keeping down the size of the abdomen—always practiced with the speed-horse—should be the rule for service of any kind, whether the animal be kept for light driving, or equally if he weigh a ton and works upon a four-ton truck.—*National Live Stock Journal.*

Tobogganning.—Tobogganing has been introduced into Boston from Canada. The sport originated with the northern Indians, and resembles double-runner coasting, only the bottom of the toboggan is a flat surface, carved upward and inward at the front end. Some of them are what are termed double-decked, so as to keep the riders above the snow, and make the toboggan easier to ride. It is steered without any great effort, and is used "sliding down hill" on snow that is soft and deep, and in which sleds and double-runners would sink out of sight. On the upper deck cleats are placed, against which the feet of the occupants rest on the journey down the snow-capped hills.

The Breeder and Sportsman, edited by Jos. Cairn Simpson, and published at San Francisco, California, at $5 per annum, is one of the best breeding and sporting papers published in America. It deserves the support of every breeder, and of every lover of rural sports on the Pacific Coast, and any one this side of the Rocky Mountains would get much more than the worth of his money by subscribing for it. It gives us pleasure to speak a good word for so excellent a journal—*Colman's Rural World.*

Random Sketches.

No. 3. The Waiter.

[Written for the Breeder and Sportsman.]

The average San Francisco man of business who is not married, and many of the married ones too, find the most convenient way to live is to reside in apartments and eat at a restaurant. Some visit the same restaurant day by day, while others have a large number of favorite houses, which they visit when they happen to fancy the special dish for which each restaurant is famous. The man who eats habitually at restaurants is in the habit of boasting of his independence. He laughingly says that there is no unalterable dinner or lunch hour to interfere with his business, and talks in a pitying manner of the poor fellows who have to be at home by six p. m. or put up with cold fish and no soup. This is a delusion and a snare, a miserable fraud, as hollow a pretence as that of the man who goes off and gets full, and then brags about what a good time he had. The regular restaurant feeder is not a happy man; he is the slave of the hash provider and a mark for the malignant despotism of the waiters. Man, as a waiter, is a failure. No matter whether black or white, French, American, Irish, German, Pole or Russian, all waiters possess the art of making a customer miserable, though nearly all go about their work in a different manner. The waiter who insists upon giving his customers what they did not order is of so common a type, and has been warned of the evil of his ways so often, that it is not now necessary to speak of him as a distinct type of the annoying waiter.

A common well-known type of waiter is the high-toned, supercilious garcon, who under cover of the most effusive politeness can make himself as insulting and offensive as a drunken man in a ball room. The instant a guest enters he hands a chair and with a lofty wave of his hand and a whisk of his greasy napkin motions to the guest to sit down. When that maneuver is completed he calmly throws the napkin over his left arm, turns his back to the guest and assumes a contemplative mood, gazing steadily at the ceiling. To a cough, "ahem" or a quietly spoken "waiter" he pays no attention and to get his notice one has either to pull his arm or yell "w-a-i-t-e-r" in a tone loud enough to call a crowd up to an auction. In answer to an inquiry as to what he has got for dinner he replies that he will get the bill of fare and in ten minutes, more or less, returns with a greasy document only to discover that it was made out the day before. This is his usual course with gentlemen in a hurry. If he chances across a quiet easy-going old fellow who wants to spend an hour in dining he will pile soup, fish, entrees, joints, vegetables, dessert, cheese and black coffee on the table as rapidly as a smart bricklayer could stand up bricks. His great delight is to detect a guest mispronouncing the name of some dish on the bill of fare. The style in which he remarks "oh, you mean on trays" in reply to a request for "entrays" makes a guest feel that he has committed one of the seven deadly sins. He makes the correction loud enough for every one to hear and all the other waiters assist in crushing the customer by snickering loudly. Ask him for more bread or butter, and he will bring enough to feed a regiment and dump it on the table with the air of an overseer of the poor bestowing municipal charity. The best way to treat a waiter of this kind is to call one of the other waiters for some trifling article and slip a coin in his hand, making sure that the supercilious waiter sees you hand over the fee. He will act like a Christian during the balance of the meal, and one can have a quiet revenge by simply saying thank you, as he hands down hat, coat and cane at the end of the meal.

Another kind of waiter nearly as offensive as this one, is the fussy, over-attentive waiter who hovers around one's chair, snatches plates before they are empty and brings a dozen things that are not asked for, and not wanted. He always puts garlic in the salad and apologizes effusively when informed that the customer does not like garlic and winds up the sum of his guilt by bringing Limburger cheese to the man whose stomach is upset by the merest smell of the odorous compound. He means well, but does too much. One hates to reprove him for fear of really hurting his feelings and so from day to day the customer goes on accumulating a stock of dyspepsia and ill nature from eating things he did not want and abstaining from the food for which his stomach craves.

Then there is the uncleanly waiter. He always puts his thumb inside the bowl of soup, and brings bread in his hands, which have just been toying with a clove of garlic or a bunch of onions. He occasionally forgets that a napkin is not a pocket handkerchief, and then in an absent-minded fashion wipes out a plate, cup or glass with the soiled linen. Having thus effectively removed the customer's appetite, he brings on the dinner, but not before he has flavored the shrimp salad with soup and the meats with a dash of apple or cranberry sauce intended for the game. Occasionally he has been known to breathe on a glass before wiping it, and he frequently polishes a plate with his gravy-bespattered coat sleeve.

The loud-voiced waiter, the deaf waiter, the waiter with a powerful breath and who always bends low to catch an order, the waiter whose nose is constantly receiving attention from his fingers, the soup-spilling waiter, the waiter who drops sugar on the meat, and the saucy waiter, who wants to know if you want the meat before it is cooked, are all common types of the fiends who make the lives of restaurant customers miserable.

There is one really good waiter in San Francisco. He works in a small restaurant in a rather out-of-the-way part of town, but is so great an attraction that the place is always crowded. Men fight for a seat at one of the tables he attends to and will wait half an hour to secure his services. The salary he commands is enormous and in the matter of fees he is better off than the porter of a sleeping car. His splendid example has done much to soften the natures of his fellow waiters and if he would only establish a training school for waiters he would confer an unequaled boon on the restaurant-frequenting people of San Francisco. To mention his name would be sure to spoil him so the public will have to hunt him up for themselves. He will probably die before he has attained the zenith of his usefulness, for such phenomena are seldom long-lived.

Tombstone *Republican:* George Hearst is said to have bought up all the principal water between Silver City and the Mexican line. It is reported in New Mexico that he has paid out nearly $100,000 for ranches that control the water, and that he will stock them with 20,000 head of cattle this year.

A Boom in Chess.

During the last three months chess in New York has received an impulse that recalls the days of 1857 when Paul Morphy's victory over Paulsen in the tournament of that year was swiftly followed by victory after victory in match games with the best individual players of Europe, and the New World learned with surprise and satisfaction that it was not behind but ahead of the old. Morphy's triumphs were the common topic of conversation. Foreign mails were eagerly watched for news of fresh laurels, the games reported were eagerly studied, and the worship of Caissa became both the masculine and the feminine fashion. From the meeting of the first American Chess Congress and the opening of the Morphy chess room on the southeastern corner of Broadway and Fourth streets, with its mammoth free tourneys attracting players from all quarters and reported by telegraph from New York to New Orleans, the game was firmly established and became one of the attractions of the metropolis. Here players from other States were sure to find hospitable reception, and foreign players were not only certain of a welcome but found their time well spent in meeting across the board such players as Stanley, Marache, Brenzinger, Ballantine, Leonard, Barnett, McLean, Doolittle, and a host of others who a few years after changed the checkered for the tented field and the mimic warfare for barbed steeds.

The death of many devotees of the game and the closing of the old rooms which were so long the recognized headquarters gave chess a severe blow. Several clubs were founded at various times, but all vanished or died except the Manhattan, which, after leaving the university, for many years had its headquarters near Chatham square, on the Bowery. Individual interest in chess has meanwhile steadily increased, as the score or more chess columns in the weekly newspapers and one of the best chess monthlies in the world testify, but several attempts in the past two years to organize a club in the central part of this city have failed.

The removal of the old Manhattan Club—the offspring of "The Morphy," to which nearly all the surviving members of that temple to Caissa have proved faithful in its languishing fortunes for many years—to its new rooms and central location at No. 110 East Fourteenth street has trebled its membership in a few months, showing that the failures were not through lack of material. "There is a regular chess boom on the Stock Exchange," said a member to a *World* reporter yesterday. "We have added more than one hundred members lately, and over one-half are from the Stock and Produce exchanges. With our present low initiation fee—only $5—and only 75 cents a month dues we expect a membership of over five hundred before the year is out. And it may be a thousand."

Mr. Wilhelm Steinitz has been engaged by the club for ten afternoons and evenings upon his return from New Orleans in February for exhibition play. The programme includes six games with Captain George H. Mackenzie, the local champion, for $20 a game ($15 to winner and $5 to loser); blindfold (simultaneous) games with four members of the club; simultaneous games with twenty-five members, and individual games with players. At the Whist and Chess Club in New Orleans last week Mr. Steinitz played a game of whist and four games of chess, without seeing the boards, at the same time; but whether a similar exhibition of skill will be given in New York has not been decided. Captain Mackenzie stands at the very head of American players, and at one time during the late tournament at Vienna it was thought that he and Mason (the two Americans) would carry off all the honors, an expectation that would probably have been verified but for unfortunate circumstances and illness; so that the match with Steinitz will be watched with the greatest interest by chess players the world over. Additional interest is also given to it by Mr. Steinitz refusing to accept Mr. Mason's repeated challenges last fall in London.

Captain Mackenzie visits the club afternoons and evenings to play with the older members or to give instructions to those who desire to benefit by his experience. Monday evenings he plays twenty games simultaneously with as many members. The next exhibition, on the 22d, will be well worth witnessing, as nearly all the players in the present tourney may be pitted against him. Chess-players visiting the city will be cordially welcomed at the club and may be sure of a game with Captain Mackenzie, if they so desire.—*New York World.*

Reclaiming Waste Land.—C. G. Dorris, who was the originator of a scheme of bringing a ditch from Pine creek to the sagebrush lands north of Alturas, says the Modoc *Independent*, is hard at work and has the ditch well under way. He is now engaged in hauling timbers for a flume to carry the waters across Pit river. The ditch will be seven miles long and will carry water enough to irrigate several thousand acres of land. Should this scheme prove a success it will be of great value to owners of land north of the river and will bring into use a large body of land that is now lying idle.

The Chico *Enterprise* says that Leland Stanford, having purchased from the Trustees the entire Gridley land along Butte creek, and adjacent to the town of Nelson, and the sale having been confirmed because of recent decisions involving the title of the Trustees to it, Mr. Stanford now proposes to protect the entire tract by a levee. Arrangements have been made with farmers owning lands about this tract for the right of way, and the work will begin immediately.

A 40 acre orchard on the river six miles above Oroville has just been leased to Chinese for the next year at $2,700, or $67 50 an acre. A local journal asks the pertinent questions: If forty acres of orchard will yield an annual rental of $2,700, why don't people who have lands along the river, well adapted to those kinds of fruit, plant more trees?

Hop poles are in such demand that they are manufactured out of sawed lumber. As millions of poles can be cut in the willow forests of the Yuba, Bear and Feather river bottoms, this may become quite an extensive field of industry. These poles grow straight and slender and when dry will be light and easy to handle.

Henry Lawrence, of Petaluma has on his ranch, on Bodega bay, 100 acres of mesquit grass. He does not plow or cultivate it, but cuts every year about a ton and a half of hay to the acre. His cattle and stock do well on it. Mr. Lawrence thinks the mesquit a good grass for worn-out lands along the coast.

The Lake County Agricultural Society will shortly begin the construction of a wide track on the Water Company's ranch two and a half miles below Lakeport.

They are gathering oranges in Los Angeles county. In Bodie the people are picking icicles from their noses. California possesses a varied climate.

The Oregon State Agricultural Society intends to make application to become a member of the National Trotting Association.

Reasoning Dogs.

A gentleman of Nashville, Tenn., talking to a reporter about animal intelligence the other day, said: "About a year ago one of my dogs suddenly died. The rest of them gathered mournfully around it, howling dismally. Finally the strongest one of them picked up the body of the dead dog and headed for an open lot, being followed by the rest of the pack in solemn procession. Arrived at the spot selected, they all set to work and dug a hole, in which the corpse was placed and covered up, after which the mourners came back looking as solemn as could be. Now, in order to have arrived at the fact that their comrade was dead, which they did by carefully smelling and stepping on it before taking it away to bury it, they must necessarily, speaking from a psychological standpoint, have had the faculty of comparison, reflection and experiment.

"That they know it is wrong to steal is a self-evident fact. I bought a very intelligent dog once from a man who had all his life been engaged in smuggling between France and Spain. Of this dog it was authentically related that it had for years been engaged in the service of smuggling, his owner strapping the contraband goods on his back and starting him across the line. The dog, of course, knew his destination, which he would reach by the quickest route. While on his way across the mountains, should he meet a peasant, he would proceed quietly on his way taking no heed of him. Should a guard or official of any kind heave in sight, however, the wild criminal would either conceal himself until all danger was past, or else make a circuitous route in order to avoid him.

"Two years ago I owned a magnificent spaniel, that only a very few times in my life had I ever spoken a harsh word to. One day that I chanced to be in a very ill humor the poor thing brushed up against my legs and looked me in the face, as if craving a kind word. Instead of this I harshly ordered it away. It immediately set up a dismal howl and ran out of the house we were in toward a creek a few yards off. When about half way towards the stream it looked back to me, I having walked to the door, and again gave a plaintive howl. I paid no particular attention to it, not realizing what his last demonstration meant. Seeing that I disregarded its mute appeal, the animal ran to the bank of the creek, jumped in, disappeared beneath the surface and never came up again. He had deliberately committed suicide through misery caused by my unjust treatment. Shame! don't talk to me about a dog being nothing more than a brute. A man is a brute to say so. The most intelligent of the canine race," continued the professor, "know it is wrong to murder. One of my dogs became very jealous of a cat that I took up and petted a good deal. One day I noticed, as I thought at the time, the two playing together some distance off. After a short while the dog took the cat in his mouth and started off with it. I followed, and when a secluded spot had been reached the dog dug a hole, in which he dropped, as I found out later, the body of the cat. He then commenced to cover it up with dirt. Suspicioning the actions of the dog I started towards the spot, when, seeing me, he flew, with a howl, and never from that time on showed his face to me. Through jealousy he had killed the cat, and intended to bury it so as never to be detected.

"Another one of my dogs was a very heavy and gluttonous eater, for which one day I rebuked him. It had a very salutary effect, and for a week afterward, when he was fed, he would eat very sparingly, taking up the remainder in his mouth, and carrying it into the kennel of some other dog, where he would deposit it, and then come back to me barking loudly, as if to say, 'Am I not a more gentlemanly dog now?'"

Box Stalls.

But the greatest blessing, because it brings to the horse the greatest number of benefits, is the capacious box stall. In densely crowded cities, wherein land is exceedingly valuable, the box may be impracticable. But in very many cities even this comfort could be introduced with pecuniary profit. Private stables should never be built without a box stall, if for no further use than hospital purposes; and public stables, even when the ground is valuable, should be provided with these great blessings. If the stall is not larger than ten feet long and eight feet wide, the horse can move around freely in it; and rest very frequently consists as much in changing position as in unconsciousness. When he is tired, or leg weary, or foot-sore, he can lie down at full length and enjoy the indescribable luxury of stretching out all four limbs to their utmost capacity. Then he can eat his food from the ground without any danger of the seeds flying into his eyes, or of dragging the hay under his feet, or making it unfit for anything else than bedding. Then he can secure free ventilation without being exposed to drafts either at the head or rear of the stall. Then, in sickness he has a commodious chamber, and in health a place where he can take an abundance of natural exercise, which is so necessary for his general health, as well as the general preservation of his muscles and feet. The horse is a much more restless animal than man. If penal punishment consisted in tying up the guilty man by the head in a narrow confinement, for twenty-four hours without intermission, it would be denounced as unnecessary cruelty; and yet horses are universally so treated with no apparent consciousness of the cruelty thereby practiced. In the box stall all this is avoided. The horse eats naturally, lies down and sleeps naturally, and roams about to take his necessary exercise naturally. The only objection that has ever been urged against the box stall, aside from its expensiveness, is the complaint that the horse is liable to rub his tail against the sides, to the serious loss of hair. Of course, this can be prevented by placing boards, like mantel shelves, around the sides of the stalls, just high enough to prevent his rubbing the dock of the tail. This is an effectual remedy where the horse is restive and mischievous enough to form this bad habit; but, frequently, the rubbing is a direct reproach to the laziness of the groom. If the tail, from the dock to the floating ends of the hairs, is kept clean by washing and judicious brushing, no irritation annoys the horse, and no rubbing against the side of the stall may be feared, as a general rule. Comfort, cleanliness, prolonged usefulness, and continued health and soundness, therefore, plead for the general introduction of box stalls for horses. In the stable economy of the near future they may become universally popular.—*National Live Stock Journal.*

It is a good time now to poison gophers, and every farmer and fruit grower should actively engage in the work. By leaving these pests to breed and multiply many a fine tree and shrub will be ruined, and a few days' labor in this line now will be worth many dollars to the owners of orchards in the future.

A Modesto firm shipped twenty-five sacks of jack rabbits to San Francisco in one day recently.

Eight tons of oysters are exported from Olympia, W. T., every week.

The Farmer's Horse—How to Breed Him.

How shall we breed the farmer's horse is a question which may well begin to agitate the minds of farmers, especially throughout the States west of Pennsylvania. The tendency for years past on the part of farmers has been to breed for special uses, but none of these their own. One has been breeding for the running course, another has looked solely for speed at the trotting gait, and still others (and perhaps the wisest of them all, because the more uniformly certain and profitable have been the results), have been breeding for heavy draft.

But none of these types constitute the farmer's horse *par excellence*. His horses must be strong enough to draw the plow, the farm wagon, the reaping and mowing machine, and active enough to draw him and his family comfortably on the road at the rate of six or eight miles an hour without banging themselves up. The farm horse must be pre-eminently one of courage and endurance; and the mythical legs of ivory, sinews of steel and hoofs of iron are none too good for his necessities. He must be hardy, energetic and docile. The lazy, dull, sluggish horse is a nuisance on the farm; if he has a fitting place anywhere in the economy of nature it is in the cities, harnessed to the ponderous drays and truck wagons, where a gait faster than two miles an hour would be unorthodox. One instinctively associates this gait with ponderous weight in the horse, a ponderous load behind him, and a smooth, level street for his work. But on the farm, where rows of corn are to be plowed, and the team must about face, or wheel to the left every five, ten or fifteen minutes, one does not care to have his patience tried with a horse that can not turn around more than three or four times between breakfast and dinner-time, or that can not step off briskly over the soft, plowed ground, or up and down the hillside. Neither does he want one so light of body and of limb that the constant draft of the plow or the reaping machine will soon break him down through sheer weight, or so mettlesome that he will tug on the bit and fret and prance all day until he and the driver are both worn out.

But there is a happy mean—a horse that will weigh from 1,100 pounds to 1,200 pounds, and about 15½ to 16 hands high; good-tempered, active, docile, intelligent, quick of motion, sure of foot and easily taught. Such is the horse best adapted to the varied use of the farm. Not so high-priced on the market as the 2:20 trotter, or the handsome, stylish carriage horse; not reared with anything like the certainty as where 1,600 to 1,800 pounds weight is the sole end and aim of the breeder's effort; but much better and worth much more money to the farmer than either of these, if he wants him for his own use.

How can he breed such horses? With such mares as are now owned by a large proportion of the farmers throughout the Western States, he need not concern himself much about the size; they will be big enough to fill the requirements, because the thousands of Percheron-Normans, and Clydesdales, and English cart horses that have been imported within the past twenty years have graded up the stock, so far as size is concerned, until the size best adapted to the farmer's use is quite as easily exceeded as otherwise. If we are to continue to use stallions of these imported strains, let our choice rest upon the smaller, more compact, quick, active, spirited ones among them; because, as a rule, they are too sluggish, too coarse, too dull and too heavy for the farmer's own use, however well they may sell and however well they may be adapted to some other purposes. But, in our opinion, more certain results will be attained from the use of our own highly bred strains of roadster and thoroughbred stallions upon these large, half and three-quarter draft mares. A strong, sound, well-muscled, intelligent, quick-gaited horse, with two or three good trotting crosses, such as Hambletonian, Mambrino Chief, Vermont Black Hawk, or Clay, built upon a genuine thoroughbred foundation—not a "said-to-be," but good, old Lexington, or Glencoe, or Sir Archy, or Gray Eagle, or Medly, or American Eclipse stock, and you have something that, for the farmer's use, is as good as gold. And we are not sure that with our coarse, cold-blooded draft-mares it will not, in most cases, be quite as well, or even better, to let the top trotting crosses go, and take a large, strong, compact, sensible, business-like thoroughbred sire to begin with. The great trouble with the majority of thoroughbreds is temper; they are, as a rule, too high-strung and mettlesome for good work-horses. But our draft-mares, on the other hand, are too idiotic, and dull, and sluggish, and soft, and flat-footed, and coarse-grained to be well adapted to farm work; and so, by blending the two types together for a few generations, we may succeed in eliminating the bad and retaining the valuable features of both, and so produce the model farmer's horse.—*Breeder's Gazette.*

Wool Sorting.—It would often be advantageous to pay more attention to the sorting of pieces than is generally done. By keeping broken fleece or first pieces very good a price greater in proportion according to quality than is given for fleece wool would be obtained. At the same time the fleece wool, by being carefully skirted, would command a much higher figure in the market. Growers who have only about fifty bales need not be at very great trouble in skirting at all, if they sell their wool in the grease, as it might not pay so well as to roll up the fleece without skirting, simply making a bale or two of locks, so as to keep the remainder clean. When fleece wool is very full of burrs or seeds it is often better to make a separate sort for such, and in some cases the whole fleece might be thrown into this lot. One burry fleece spoils a whole bale. Some wool pressers, anxious to keep unsatisfactory fleeces out of sight, throw them into the bottom of a bale, and it is decidedly damaging when that particular bale happens to be opened at the bottom for inspection.

The Sunset Route.—The following rates of passage have been adopted over the Southern Pacific Railroad from San Francisco, via El Paso, San Antonio and Houston, to New Orleans: For first-class tickets with stop-over privileges, $98 50; second-class tickets for a continuous trip, $80; third-class tickets for a continuous trip, $55. The following named rates are now in effect for passage by rail from New Orleans, La., to New York city, N. Y.: For first-class tickets, limited, according to route, $53 50 to $45 35; first-class tickets, limited and for continuous trip, all routes, $38; second-class tickets, limited and for continuous trips, all routes, $24 50

We have to acknowledge the receipt of our esteemed San Francisco contemporary, The Breeder and Sportsman, for the four weeks ending October 21. Three excellently executed equine portraits adorn the pages, including the imported English draft stallion Black Prince, the French-bred carriage stallion Admirable, possessing several lines of English thoroughbred blood, and the beautiful Algona, a trotting stallion by Almont, out of Emma Kinkead, by Conscript. This journal bids fair to be the best sporting journal in America, as in every issue advancement is made. *Australian, Melbourne.*

THE STAGE.

Continued Success of "Esmeralda"—The Minstrels Still Drawing Well—Etc.

The success of "Esmeralda" has surpassed the most sanguine anticipations of the management, and it appears as if the pretty domestic play will score another four-weeks' run in the annals of the Baldwin Theater. It is pleasant to chronicle such a fact, as it demonstrates that our public can fully appreciate the merits of a simple drama, admirably delineated in all its phases, and that the management can command sympathy and patronage in its efforts to instill a more healthy tone to our histrionic literature. Both the play and players appear to improve on better acquaintance, and although slight flaws can be detected in the evolution of the plot, as well as in the treatment of the characters, still it is not to be gainsaid that "Esmeralda" is worthy of being placed on a par with "Hazel Kirke," that unparalleled success of the modern drama. Let it, however, be at once conceded that the success of the piece must mainly be attributed to the artistic manner in which all the parts are given, for in medium or incompetent hands it would be impossible to enlist that sympathy and interest which, as the case now stands, are unflagging from the rise of the curtain until it falls. The parts of Elbert Rogers and his wife are wonderful foils in the hands of such artists as Leslie Allen and Mrs. Whiffen, and although the former role greatly enlists the audience, it is perfectly understood that the latter character is even more ably and consistently worked up to the requirements of the partly somber effects of this pastoral production. Miss Viola Allen as the heroine is somewhat lacking in dramatic force, but a more charming "Esmeralda" could scarcely be found in both the Carolinas. Ed Buckley has wonderfully improved since his last engagement in this city, and at once regained the favor of his audience by his quiet yet effective delineation of Dave Hardy. As Estabrook, Mr. Whiffen has but little opportunity to display that eccentric humor for which he is credited, but still in his scenes he brings out the author's ideas with a clearness and descision that shows his capacity for far more important characters when he gets the chance. Miss Cowell and Miss Leslie as the Desmond sisters assist materially in giving the lighter shading to the pleasant picture, and H. Rich as the Marquis and T. Oakes Rosse as Jack Desmond, are quite acceptable in their minor parts. The scenery is somewhat uneven, but the change from the farm house to the artist's studio is a marvel of dexterous effect that is highly creditable to Dave Belasco and his assistants. It is needles to add that every requirement that can tend to the comfort of its patrons is amply provided for by the management and the new regime has been inaugurated with pronounced success. Bronson-Howard's drama, "Young Mrs. Winthrop," is in preparation, but it would appear as if it would not be wanted for still two weeks, so strong is the attraction of "Esmeralda."

"Pop" continues to be the talk of the town, and it is generally conceded that a brighter whimsical comical production has not been seen here in a long period. There is no pretension to a plot in the piece, but in its incoherence there is a jollity and effervescence that is highly conducive to mirthful enjoyment. Miss Kate Castleton is bright and charming, with perhaps a tendency to a superabundance of vivacity. The clever French criticism on Madame Theo in a somewhat similar role may, in a measure, be applied to Miss Castleton: "*C'est risque mais quel diable de chic*," a phrase scarcely to be translated into the English language. Very pleasing indeed is Miss Irene Perry, who at once stepped into popular favor, and Miss May Stemhler and Miss Lillie Gruh are both winsome and attractive. The star in the piece, however, is John A. Mackay who, in the delineation of the leading character, has developed an amount of pure eccentricity and humor that, if improved on in other parts, will place him at once on a par with the leading comedians of the age, unless he is spoiled by the adulation of flattering friends. His efforts are very creditably aided by G. K. Fortescue (who is really a host in himself), by C. Dungan and those old favorites, Messrs. Doyle and Murdock. The songs and incidents show variety and versatility by the entire troupe, and "Pop" is just the entertainment to drive dull care away, and to afford pleasure to the most *blase* of our theater goers. With new songs and scenes it will probably run another week to the same thronged houses.

"The Tour of the World" was revived at the California theater, probably with a view of utilizing to the best advantage the final week's engagement of M'lle Cornalba, the graceful Ariel and the grotesque Girards. The attendance has been fair throughout the week, which shows that the eccentric story, with its spectacular effects, has not entirely lost its hold on popular favor. Under such conditions the production calls for no extended criticism, save that Mr. Fred Bert showed a keen appreciation of the possibilities in the delineation of Phineas Fogg, and that Miss Phœbe Davis made her reappearance as Ayouda, a part that requires a pretty face and figure rather than extended histrionic talent, so that the young lady was much more at home than were some of the other artists in the rendition of the principal characters of the piece. Next week Miss Ellmenreich makes her debut on the English stage in the ever-attractive drama "Camille" and great interest is taken in the event, especially among the German population, with whom this young artiste is a great favorite. Endowded as she is with a handsome, intelligent face, a graceful figure, and dramatic power of the first order, she will, in all probability, score a great success, if, as is said, she has surmounted the difficulties of English accent and idioms. "Marie Stuart" and "Adrienne Lecouvreur" will complete her repertoire for this engagement, but Madam Ellmenreich will propably appear at the East in some new piece, if she can find one fully adequate to her requirements. We shall be pleased to record her brilliant reception.

The new season has been inaugurated at the Standard Theater with a great rush and the attendance during the past week has been so large as to justify the management in its attempt at any cost to keep alive the public interest in the Minstrels' entertainment. The six new stars are all well in their respective lines, but the greatest meed of praise must be given to William Courtright and J. Carroll Johnson, not only in regard to their versatility but also for their infusing wit and fun in their delineation of the end men in the introductory part, with D. R. Hawkins as a very efficient interlocutor. The programme is full of amusing sketches. songs and dances, many of which are novel in their way, and they excite great laughter and applause. Burton Stanley and W. B. Blaisedell are important acquisitions to the troupe and combined with such artists as Johnson and Powers and Charley Reed and Billy Emerson, a better company cannot be found in the whole country. If any fault can be found with the entertainment, it is the same as that of the plum pudding; it is too full of rich things, but in this case laughter aids digestion.

The Tivoli has made a prosperous run with "La Traviata," the management overcoming the difficulty of presenting so exacting a score by the doubling of almost all the principal parts. Such liberality merits success, and in the search for novelty, the Kreling Brothers have secured the libretto of one of Offenbach's earlier works that met with a brilliant reception in France, and served to establish his reputation. It is entitled "The Bridge of Sighs" and combined with a pleasing plot it is said to contain many bright and catching melodies in the true Offenbachian style. This will be its first production in America, and the work will doubtless be a pleasing change in the repertoire of the establishment.

Dramatic Notes.

A. C. Gunther has overhauled his play "Cuba" that was a failure some two years since and, introducing new scenes and treating the drama more in a spectacular point of view, he has now achieved a fair success at Boston, where it will have at least a two-weeks run. The part of the heroine is taken by Miss Rose Osbourne, who for some time was leading lady at the Baldwin, and she appears to have made an agreeable impression at the Hub. Miss Osbourne is an artist of undoubted talent, but in this city she had but scant opportunity of creating parts that were suited to her line. At the East she will have a better chance of establishing a repute, and we hope that she will fully avail herself of the advantage.

One of the pleasing announcements of the week is the engagement of the Wyndham company at the Bush Street Theater. Mr. Wyndham enjoys the reputation of being the best light comedian of the age, and it is said that in "Brighton" (an English adaptation of Saratoga) his impersonation of Bob Sackett was so bright, whimsical and entertaining as to be the talk of London for an entire season. Mr. Wyndham brings with him his own company from England and judging from the general encominms with which they have been recieved at the East, the members are all admirably suited to the requirements of their parts. The Wyndham engagement should net a fortune to the Bush Street Theater management.

Charles E. Locke has arrived here with a view of organizing a series of popular concerts, in which the well-known orchestra of Theodore Thomas will form the main attraction. Considering the great expense attending the transportation of so large a personnel, such an undertaking is of a risky character, especially if singers of the first class are not engaged as the special attraction. Then it is doubtful if the acoustic properties of the Mechanics' Pavilion are favorable for the production of oratorios on a grand scale. At the Crystal Palace in London it took a year's experiments before the acoustic faults could be remedied; but then, of course, the space was much larger than at the Mechanics' Pavilion. In any case, if a guarantee fund is to be raised for these concerts, there is no one more likely to achieve the end in view than Charles E. Locke.

Neill Burgess has dropped the Widow Bedott and now appears in another female part in a comedy farce taken from one of the humorous novels of Mariette Holly. The dramatization is said to be of a commonplace order and not at all likely to prove a good starring piece.

Miss Ellie Wilton now supports John A. Stevens in his own drama, "A Passion's Slave," that was the attraction that mainly caused the collapse of the Standard theater under Amory Sullivan's management. A lithograph of the King Henry the Fifth kiss that occurs in the play between the hero and heroine is of a suggestive character, and ought to draw crowded houses. Whether this engagement may be judged as an advance in her profession for Miss Wilton remains to be seen.

THE KENNEL.

Another Answer.

In answer to Mr. Carroll's reply to his challenge S. Brinkerhoff writes to the local Dixon paper the note appended below. Mr. Carroll in further answer says that he is willing enough to run the proposed matches and considers Mr. Brinkerhoff's proposition about judges perfectly fair but he does not feel disposed to run the Dixon dogs on Dixon ground.

Dixon he says is a long way from San Francisco and the trip is an expensive one for himself and his many friends who would like to see his dogs run. If Mr. Brinkerhoff will name any other place outside of his own home Mr. Carroll will disregard the distance and accept the proposition.

The fact that a challenge originally emanated from Carroll is hardly sufficient he thinks to give the acceptor the right to name the place of coursing. In the case of Mark Devlin, the first acceptor of the challenge, Carroll waived that point and allowed him to select the ground, but he does not feel called on to make so great a concession to all subsequent acceptors.

A gentleman from Red Bluff also sent an acceptance of Carroll's challenge on the condition that the match he run off at Red Bluff. While Mr. Carroll does not desire to name the ground himself he suggests that at the spring meetings of one of the San Francisco clubs he will be at Merced with his dogs and open to make matches against all comers. It is also probable that a match will be run at Sacramento this spring; and that would be a good place for both Carroll and the Red Bluff and Dixon acceptors:

ED. TRIBUNE: I will match Blue Jacket against Paul Jones, best two in three courses, or I will match Blue Jacket and Dakota against Paul Jones and Stonewall Jackson, for $100 a side, the match to be run off at Dixon at any time after the 1st of March, 1883. If Mr. Carroll and myself cannot agree upon a judge, each of us to select a gentleman and they to select a third, who will judge the match. As Mr. Carroll issues the challenge, I claim the right to name the place. Respectfully, S. BRINKERHOFF.

Dixon, January 29, 1883.

Coursing at Red Bluff.

Last week the Red Bluff and Tehama conrsers ran a match midway between the two places for various stakes. The judges were A. Leach of Red Bluff and Buchanan Kelly of Willows. Brooks of Tehama slipped the dogs. The first race was for $20, between Dr. De Puy's Gip and Gregg's Boh, in which the latter proved the victor. Then came a $25 stake between Dr. De Puy's Blanche, J. W. Clark's Spring, Lovett's Blucher and Lovett's Beauty. After two undecided conrses Blucher beat Spring, and after one undecided course Blauche beat Beanty. In the final course between Blanche and Beauty a bad slip was given, and as soon as Blanche got in the hare went to cover. The course was undecided and the match declared off. We were not present at the match and have only the report in the local paper to go by, but if that be correct the judges erred in not giving the last race to Blanche. The rule says that in no case shall speed without subsequent work decide a course, except in case of a long lead to cover, where one dog shows a decided superiority over the other. If, as was reported, Blanche got 40 yards the worst of the start and succeeded in making a go bye before Blucher made a point Blanche should have had the race.

In the case of the first race, between Blanche and Beauty, when a third dog joined in the course, the judges had a right, if they saw fit, to decide the course on the work done prior to the third dog getting in. Of course, if that work was equal the judges could not do otherwise than give it an undecided course, or a "no course," according to circumstances.

Modesto Coursing.

A Modesto newspaper asks why the San Francisco Coursing Clubs prefer Merced to Modesto as a coursing ground. The question is easy to answer and the answer is simply that the accommodations at Merced are the best. The clubs would much prefer to go to Modesto if all things were equal, as the distance to be traveled by rail is so much less than to Merced. The Pacific Coast Club went to Modesto once and reported that the teams provided were insufficient, that no saddle horses could be got fit for the judges, that the gentleman who had volunteered to act as guide lost his way, and finally that the hotel accommodations were not first-class. We presume the latter complaint could not be made now as Modesto is a live and growing town, but if there are not good grounds within ten miles of the town sufficient to run off two dozen courses a day it is of no use to talk about holding a club match of any size there. Doubtless some member of the Modesto Coursing Club can enlighten the BREEDER on that point. As to saddle horses, at least six first-class animals are needed when three judges are used. In case of one judge two good horses are enough, but they must be good ones. The clubs are always willing to pay $3 a day for the hire of every saddle horse they use, and in case only one judge was employed would gladly pay as high as $5 for the use of a first-class horse. The case of animals that have recently been provided for the judges at Merced are a disgrace to civilization and a positive danger to the rider. If Merced does not attend to this matter in the near future the clubs will have to try Modesto or some other place.

Mr. Carroll's Challenge.

Mr. Carroll informs us that he has accepted all the reasonable matches that have been sent in so far and that his challenge is now withdrawn and in future he will pay no attention to other challenges. As Mr. Brinkerhoff has already taken steps to make a match, Mr. Carroll will make an exception in his favor and will make a match with him provided he will agree on a fair ground mutually convenient. If this gentleman will select some place outside of his own home and about equidistant between his home and San Francisco he can have a race. If that does not meet his views further correspondence will be useless. From the amount of talk we heard from gentlemen claiming to each possess the best dog in the State, we expected that a dozen acceptances at least would be sent in from this city alone, but it seems there is some difference between talking in front of a bar about running against any dog in the State and putting up a little money to make a match. Perhaps the talkers are now saving their dogs for the public meetings.

CALIFORNIA COURSING CLUB.—Next Wednesday night the members of the California Coursing Club will meet at 509 California street for the purpose of electing officers to serve for the next two years, and the transaction of other important business. All the members are expected to be present.

Frank Flynn claims the title and reputation of being the champion pin-pool player of Chicago. He made both Carter and Lou Morris quit, has been barred from all open games, and stands ready to meet anybody who thinks he can play the game.

Mr. John Taylor, of Comptou, who has gone into carp culture on his place, is now constructing a third reservoir, or pond, to cover about two acres, thus making four acres of water devoted to the raising of fish. His stock is increasing at an almost marvelous rate, and the older fish have attained quite a large size.

The Fish Commissioners have recently deposited 500,000 whitefish eggs from Northfield, Mich, in the lake near San Leandro, for hatching.

Catfish have made their appearance in the Mokelumne river above Lancha Plana, having climbed the ladders at the dam of the Mokelumne Irrigation Company.

J. R. Keene's horses in this country will be trained by Robert Clare.

Sudden Changes of Weather are productive of Throat Diseases, Coughs, Colds, &c. There is no more effectual relief in these diseases to be found than in the use of BROWN'S BRONCHIAL TROCHES. Price 25cts.

Market Report.

WHIPS, BOOTS, ETC.

767 Market Street, San Francisco.

SPECIAL ATTENTION given to the manufacture of "boots" of all kinds for horses. Can refer to all the principal trainers and horsemen on the Pacific Coast.

N. B.—My acknowledged superiority in this branch of business is largely due to careful observation and the valuable suggestions of the most skillful turfmen of the United States, the benefits of which revert to the public in the shape of a GENUINE WELL-FITTING ARTICLE. Sole agent for Dr. A. H. Dixon's Condition Powders and for Makinney's patent "Eureka" and "Eclipse" Toe Weights. Repairing done with neatness and dispatch. Has always on hand the finest assortment of English ladies' and gentlemen's saddles, bridles, whips, spurs, bits and 2½-lb race saddles.

HORSEMEN, ATTENTION.

The Horse's Friend

Prof. W. H. Woodruff,

VETERINARY DENTIST,

LATE FROM BOSTON, CALLS THE ATTENTION of horsemen to the fact that there are hundreds of horses in this city absolutely suffering from sore mouths and other complications directly caused by had teeth, and they show this by the following had habits:

Bit Lugging, Driving on one Rein, Balking, Bolting, Tossing the Head while Driving,

PULLING ON THE BIT,

Drooling and Foaming at the Mouth,

and other faults which can be corrected by dental manipulation. The Professor can be consulted at his office at the Fashion stables, 221 Ellis street. Office hours from 8 to 9:30 a.m., 1 to 2:30 and 6:30 to 7:30 p. m., Tuesdays excepted, when he will be at Thirteenth street stables in Oakland. Orders left at the Club stables, Taylor street, and the St. George, Bush street, or by mail, will receive prompt attention. Consultation and examination gratis.

N. B.—Particular attention paid to gents' drivers.

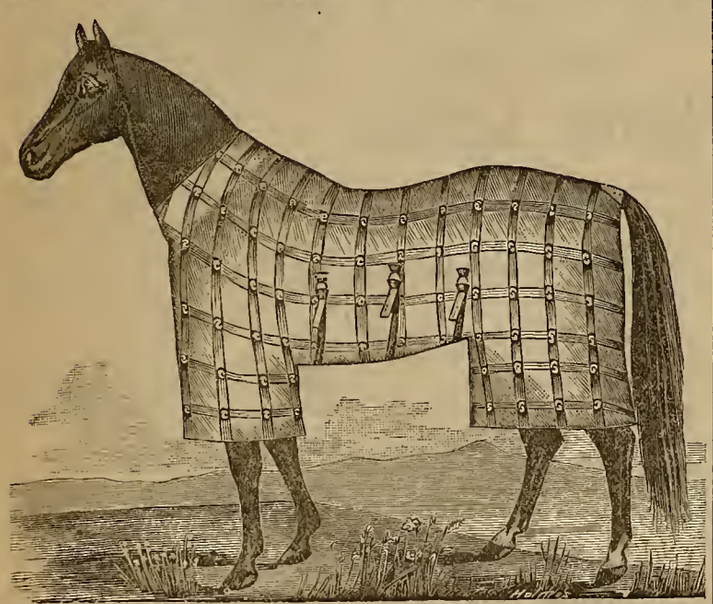
IMPROVED HORSE CLOTHING.



Secured by Letters Patent ISSUED MAY 27, 1879. REISSUED MAR. 29, 1881.

The above cut represents the body-piece, the patent also covering the improvements in the hood. The following are the claims granted:

1. An improved blanket or covering, consisting of the body-piece A, flap C, and the extension B, forced or united together, so as to cover the body and legs of the animal, substantially as herein described.

2. The blanket or covering A, having the flap C, and the extensions B, to fit the fore and hind legs of the animal, front fastenings F G, and the permanent straps or bands E, substantially as and for the purpose herein described.

3. The blanket or covering A, with its extensions B, permanent securing-bands E, and the front fastenings F G, in combination with the elastic neck-extension H, substantially as and for the purpose herein described.

4. The blanket A and hood J, in combination with the elastic connecting-strip I, substantially as described, and for the purpose set forth.

5. The close-fitting hood J, having the elastic band L beneath the jaws, so that they may be allowed to move without disturbing the fit, and adapted to be secured to the cover by means of straps, substantially as herein described.

6. The improvement in covering-blankets for animals, consisting of the blanket A, having the flap C, and permanent straps or bands fixed to it to secure it around the body, whereby the use of loose surcingles is avoided, substantially as herein described.

The right to make clothing in the United States will be sold on a royalty. Apply to the patentee,

JOS. CAIRN SIMPSON,

(150 x 50 feet)

FOR WARM SALT WATER, PLUNGE AND SWIMMING BATHS.

ELEGANT ROOMS

For Individual Baths with DOUCHE and SHOWER facilities.

MAGNIFICENT BEACH

Of pure white sand for SURF BATHING, Etc., Etc.

THE FAVORITE ROUTE to those well-known Watering Places,

APTOS, SOQUEL AND SANTA CRUZ,

IS VIA THE

Southern Pacific Railroad,

(Broad Gauge), and the

SANTA CRUZ RAILROAD.

☞ At PAJARO, the SANTA CRUZ R. R. connects daily with Trains of the S. P. R. R.

The S. P. R. R. runs through the counties of San Mateo, Santa Clara, San Benito, Santa Cruz and Monterey, in each of which game abounds in great variety. Notably

Quail, Pigeon, Snipe, Duck, Geese, Deer and Bear.

Lakes PILARCITOS and SAN ANDREAS are reached by this line. Stages connect with trains daily at San Mateo for those well-known Retreats, PURISSIMA, SAN GREGORIO and PESCADERO. We would particularly call attention to the unlimited extent of range at and about SAN BRUNO and McMAHON'S for RIFLE PRACTICE.

These resorts are but a short distance from San Francisco and offer special inducements to the lovers of this manly sport.

SPECIAL NOTICE.

Sportsmen and others presenting Passage Tickets o any description issued by this Company will be entitled to

FREE TRANSPORTATION OF THEIR DOGS

when carried in Baggage Cars and put in charge of Train Baggagemen. Train Baggagemen are instructed to issue CHECKS for all dogs received in Baggage Cars.

☞ In order to guard against accidents to Dogs while in transit, it is necessary that they be provided with COLLAR AND CHAIN. Guns and Fishing Tackle checked and carried free of charge. Gunstaken apart and securely packed in wood or leather cases may be taken in Passenger Cars.

TICKET OFFICES.—Passenger Depot, Townsend street, and No. 2 New Montgomery street, Palace Hotel.
A. C. BASSETT, Superintendent. H. R. JUDAH, Asst. Pass. and Tkt Agt,

☞ S. P. Atlantic Express Train via Los Angeles Yuma, etc., leaves San Francisco daily via Oakland Ferry, foot of Market Street at 9:30 A. M.

Spring Race Meeting.

PACIFIC COAST

Blood Horse Association

First Day Regular Meeting—Saturday, April 21.

No 1—California Stake; for two-year-olds; dash of half a mile; closed with thirty-two nominations.
No. 2—Hearst Stake; free for all; $25 each, $10 forfeit, $125 added; second to save stake; dash of three-quarters of a mile.
No. 3—Winters' Stake; for three-year-olds; dash of a mile and a half; closed with twenty-eight nominations.
No. 4—Hurdle race; purse of $150, of which $25 to second horse; entrance free; a dash of a mile and a quarter over five hurdles.

Extra Day—Wednesday, April 25.

No. 5—Purse $150, of which $25 to second horse; entrance free; for two-year-old fillies; dash of five-eighths of a mile.
No. 6—Purse $200, of which $50 to second horse; entrance free; for maiden three-year-olds; dash of a mile and an eighth.
No. 7—Purse $200, of which $50 to second horse; entrance free; free for all; dash of a mile.
No. 8—Selling race; purse $175, of which $25 to second horse; entrance free; dash of one and an eighth miles; horses entered to be sold for $1,000 to carry their entitled weight; two lbs. allowed for each $100 under that valuation; horses entered for over $1,000 to carry three lbs. over entitled weight for each $100 above that valuation.

Second Day Regular Meeting—Saturday, April 28.

No. 9—Purse $150, of which $25 to second horse; entrance free; for two-year-old colts; dash of five-eighths of a mile.
No. 10—Handicap Stake; for three-year-olds; $25 entrance, $10 declaration; $200 added; $50 to second horse; third to save stake; dash of one and three-eighths miles; weights to be announced Thursday, April 26, at 8 p. m.; declaration to be made Friday, April 27, at 12 m.
No. 11—Pacific Cup; handicap of $50 each; $20 declaration; $500 added; second to receive $150; third to save stake; two and a quarter miles; weights announced April 21; declaration April 25, at 3 p. m.
No. 12—Hurdle race; purse $150, of which $25 to second horse; entrance free; dash of a mile and a half over six hurdles.

Second Extra Day—Wednesday, May 2.

No. 13—Purse $150, of which $25 to second horse; entrance free; for two-year-olds; winners at this meeting excluded; horses running second, five lbs. extra; dash of five-eighths of a mile.
No. 14—Handicap Stake; free for all; $25 entrance; $10 declaration; $200 added; $50 to second, third to save stake; dash of one and a quarter miles; weights to be announced Monday, April 30, at 8 p. m.; declaration Tuesday, May 1, at 12 m.
No. 15—Selling race; Purse $175, of which $25 to second horse; entrance free; dash of one and a quarter miles; conditions same as No. 8.
No. 16—Handicap Stake; for three-year-olds; $25 entrance; $10 declaration; $200 added; second to save stake; three-quarters of a mile and repeat; weights announced and declaration made same as No. 14.

Third Day Regular Meeting—Saturday, May 5.

No. 17—Gano Stake; for two-year-olds; dash of three-quarters of a mile; closed with thirty-two nominations.
No. 18—Spirit of the Times Stake; for three-year-olds; dash of one and three-quarters miles; closed with twenty-eight nominations.
No. 19—Purse $250, of which $50 to second horse; entrance free; for all ages; dash of two miles.
No. 20—Hurdle race; purse $200, of which $50 to second horse; entrance free; mile and repeat over four hurdles.

Entries to stakes and purses not marked closed, will close March 1, 1883.
Races to close will be run under weights adopted at annual meeting, 1881.
Starters in all races must be named at 6 p. m. the day preceding race, any other rule to the contrary notwithstanding.
Non-members will be placed on the same footing as members of the association in regard to the payment of purses and stakes advertised, and should there be a deficiency the winners will receive a pro-rata division.
Parties making nominations will be required to record colors at time of making entries, and after record will not be allowed to ride in other colors. This rule will be strictly enforced.
All nominations in stakes and entries in purses must be made on or before the first day of March next, 1883, directed to C. M. Chase, Assistant Secretary, Box 1961, P. O., San Francisco. To be valid they must be plainly postmarked on that day—March 1.

IMPROVED

Blind Bridle & Winkers

FOR RACE HORSES.

Secured by Letters Patent, July 25, 1882.

Having thus described my invention, what I claim as new, and desire to secure by letters patent, is:
1. The part D, supported by the side straps of the bridle, extending back, as shown, the front having an opening into which the blind is fitted, substantially as herein described.
2. In a bridle, in combination with the extensions D, the curved blinds F, secured to said extensions, and as shaped, to give full freedom and ventilation to the eye while circumscribing the vision, substantially as herein described.
3. In a bridle, and in combination with the extensions D, blinds F, and side straps A, the screw, nut and washer E, to secure the blind and allow it to be set, substantially as herein described.
4. In a bridle, and in combination with the check-pieces D and blinds F, as shown, the straps or bands G and H, connecting the branches or extensions above and below the eyes, and having the adjusting slides or buckles, substantially as and for the purpose herein described.
5. In a bridle, and in combination with the blinds F, supported and pivoted to the bridle so as to be movable about the point of support, the adjustable front straps or bands G and H, and the rear band I and the throat-latch or lash connected with the blinds, and adjustable, substantially as herein described.

The above are the claims allowed by the patent office, and though the corresponding letters do not appear on the cut, the general principle will be understood.
It meets with universal approbation, doing away with all the objections urged against blinds, and at the same time giving complete control of the line of vision. By throwing the lower portion of the blind up something of the same effect on the action follows as is induced by toe-weights. This is especially the case when young colts are the pupils, teaching them to bend the knee without the strain of weights on the feet.
For bridles of all descriptions apply to

JOHN A. McKERRON,
Nos. 230 and 232 Ellis street, San Francisco.

THAD STEVENS.

THIS THOROUGHBRED HORSE WILL BE AT Agricultural Park, Sacramento, for the season commencing Feb. 1 and ending the 1st of July next. Good pasturage for mares will be provided at $3 per month. For terms and particulars apply to or address

W. M. MURRY, Agent,
Sacramento Racetrack.

The Thoroughbred Stallion

JOE HOOKER,

BY MONDAY.

First Dam Mayflower, by imported Eclipse.
Second dam Heunie Farrow, by imported Shamrock.
Third dam Ida, by imported Belshazzar.
Fourth dam Gamma's dam, by Sir Richard.
Fifth dam by imported Eagle.
Sixth dam Bet Bosley, by Wilkes' Wonder.
Seventh dam by Chanticleer.
Eighth dam by imported Stirling.
Ninth dam by Clodius.
Tenth dam by imported Silver Eye.
Eleventh dam by imported Jolly Roger.
Twelfth dam by Partner.
Thirteenth dam by imported Monkey.
Fourteenth dam imported mare from the stud of Harrison of Brandon.

TERMS—$50 THE SEASON, TO A FEW MARES OF APPROVED BREEDING. GOOD PASTURAGE for mares from a distance at $1 per mouth. Care will be taken to avoid accidents and escapes, but the owner must take the risks.

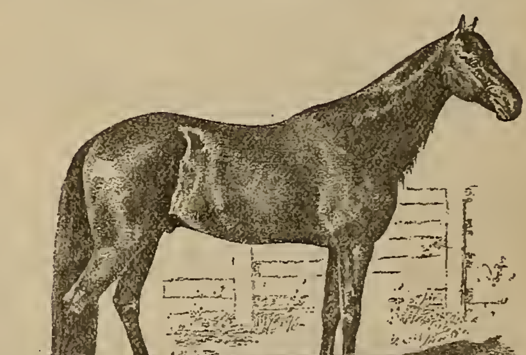
My place, where Joe Hooker will make the coming season, is five miles from Sacramento on the Freeport road.

This young stallion has proved to be one of the most successful racing sires, and every one of his colts that has been trained can run fast. Among them are Fred Collier and Jim Renwick. For history of Joe Hooker see BREEDER AND SPORTSMAN Jan 20, 1883.

THEO. WINTERS, SACRAMENTO, CAL.

MAMBRINO TROTTING STALLION

Record at Six Years Old, 2:21½.



Record at Six Years Old, 2:21¼.

ABBOTSFORD.

PEDIGREE.

BY WOODFORD MAMBRINO, HIS DAM COLUMBIA BY YOUNG COLUMBUS. WOODFORD Mambrino by Mambrino Chief, his dam Woodbine by Woodford, a thoroughbred son of Kosciusko.
Woodford Mambrino is recognized to be the best son of Mambrino Chief. His own record is 2:21¼, and there are a large number of his get in the 2:30 list. Among them: Abbottsford, 2:21½; Convoy, 2:22½; Magenta, 2:24½; Lady McFatridge, 2:29; Dacia, 2:29½; George A. Ayer, 2:30.
Besides those having public records, he is the sire of the two celebrated mares owned by Robert Bonner—Manetta and Malice. Manetta, with a running mate, and harnessed to a road wagon, trotted two miles in 1:27¾, and Malice trotted a trial, on the same track, a mile in 2:19¾. Woodford Mambrino is also the sire of Princeps, the sire of Trinket; record, 2:14. Woodbine is also the dam of Wedgewood, record, 2:19. Young Columbus, the sire of the dam of Abbottsford, has nine of his get in the 2:30 list, so that on both sides of the house there are notable performers. Abbotsford is a rich rosewood brown, 15¾ hands, and of very high form. His get are very promising, his daughter Jasmine having won the Embryo Stake for yearlings in 1881, and every one which has been put in training has shown good speed.

TERMS.

Seventy-five dollars the season, to be paid before removing the animal. Mares not proving in foal can be returned the following season free of charge. Good pasturage at reasonable rates, and extra pains taken, but no liability for accidents or escapes.

LOCATION.

Abbotsford will make the ensuing season, 1883, on the ranch of S. B. Whipple, Esq., San Mateo, season commencing February 15th and ending June 1st, 1883. For full history see the issue of BREEDER AND SPORTSMAN of August 5th, 1882.

A. WALDSTEIN,

320 SANSOME ST SAN FRANCISCO.

TROTTING STALLIONS
Singleton and La Harpe.

SINGLETON WILL MAKE THE COMING SEASON, FROM MARCH 1ST TO JULY 15TH, 1883, AT the farm of the owner, three miles north of Chico, Butte Co., Cal.

PEDIGREE.

Singleton is by Willie Schepper, a son of Rysdyk's Hambletonian, his dam Lightfoot (the dam of Pride) by Flaxtail, a son of Pruden's Blue Bull.

DESCRIPTION.

Singleton is a dark brown horse, tan flanks and muzzle, a little tonch of white on hind feet and one fore foot, and star in forehead. He is 15¾ hands high and weighs 1,100 pounds. He was bred by Dr. M. W. Hicks, foaled spring of 1878.

TERMS.

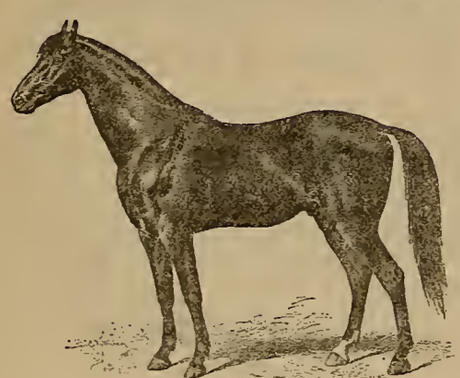
Fifty dollars the season. Mares not proving in foal will be bred the following season free of charge. Mares from a distance will be pastured without charge during the season. Mares shipped to Chico, consigned to me, will be received on arrival of train, and taken to the ranch. Mares kept in any manner their owners desire, at reasonable rates. There is every convenience on the place, boxes, paddocks and plenty of shade and water.

LA HARPE

Will also make a short season at the above place on private terms. La Harpe is by Fame, a son of Alexander's Belmont, his dam Prairie Bird by Flaxtail, the dam of Flight and Prompter. Address

J. T. McINTOSH,
CHICO, CAL.

MAMBRINO WILKES



Black Stallion, sixteen hands in height, by George Wilkes, son of Rysdyk's Hambletonian, bred by B. J. Treacy of Fayette County, Kentucky. Dam Lady Christman by Toddhunter's Mambrino or Idol, son of Mambrino Chief. Second dam by Pilot Jr. Third dam by Kentucky Whip. Idol's dam was thoroughbred and was by American Eclipse.

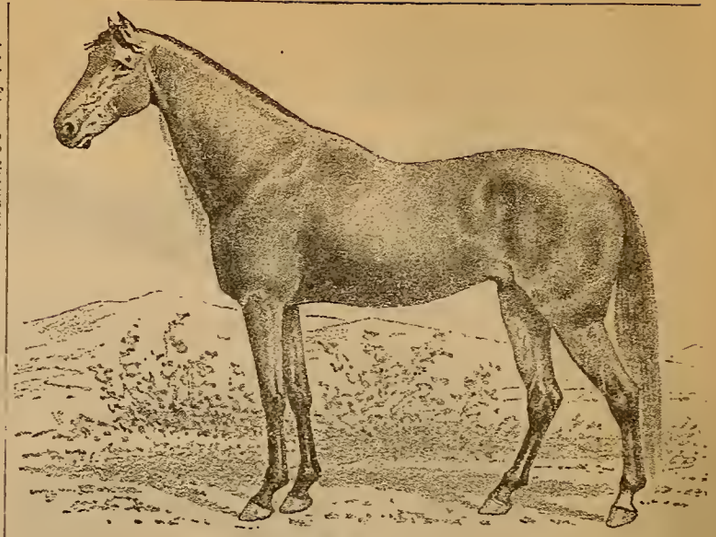
THIS IS THE LARGEST AND ONE OF THE BEST COLTS OF GEORGE WILKES (WEIGHING at this date 1,270 pounds) combining the Hambletonian and Mambrino strains and also several thoroughbred crosses. His colts demonstrate that he possesses in an eminent degree the same faculty of transmitting the family qualities to his offspring which put George Wilkes in the front rank as a sire of trotters.

Will make the ensuing season, beginning February 1st, 1883,

AT STOCKTON.

In putting the price by the season at the low figure of $40 the owner does not acknowledge, thereby, any inferiority on the part of this horse to any other sire of trotters.

IRVIN AYRES.



ALBERT W.

By Electioneer. His Dam Sister to Aurora by John Nelson.

WILL MAKE THE ENSUING SEASON, COMMENCING THE 15TH OF FEBRUARY, 1883, AND ending the 1st of July, 1883, at the Oakland Trotting Park.

TERMS, $200 THE SEASON.

MONEY PAYABLE BEFORE THE MARE IS TAKEN AWAY. GOOD PASTURAGE AT $5 PER month. No responsibility for accidents or escapes.
No. 320 Sansome street, San Francisco, Cal. A. WALDSTEIN.

ANTEEO.

DARK BAY COLT, NEAR HIND FOOT WHITE; FOALED MAY 5TH, 1879; BRED BY JOSEPH Cairn Simpson, Oakland, California.

By Electioneer.

1st dam—Columbine, by A. W. Richmond.		7th dam—By imported Medley.	
2nd " Columbia, by imported Bonnie Scotland.		8th " By imported Centinel.	
3rd " Young Fashion, by imported Monarch.		9th " By Mark Anthony.	
4th " Fashion, by imported Trustee.		10th " By imported Janus.	
5th " Bonnets o' Blue, by Sir Charles.		11th " By imported Monkey.	
6th " Reality, by Sir Archy.		12th " By imported Silvereye.	
		13th " By Spanker.	

See Bruce's American Stud Book, vol. 1, p. 307, and vol. 3, p. 79.

Will make the ensuing season, 1883, from February 15th to June 15th, at the Oakland Trotting Park. Terms $50 the season.

JOSEPH CAIRN SIMPSON

Oakland or 508 Montgomery St., S. F.

HAMBLETONIAN TROTTING STALLION
BOB MASON

By Echo. His Dam Belle Mason by Belmont, Thoroughbred.

Echo by Rysdyk's Hambletonian, his dam Fanny Felter by Magnolia (by American Star). Belle Mason by Belmont (Williamson's); First dam Lucy Johnson by the Pony (son of Imported Leviathan); second dam Catalpa, by Frank; third dam by John Richards.

WILL MAKE THE ENSUING SEASON, LIMITED TO TWENTY MARES, COMMENCING FEBruary 15, 1883, and ending June 15, 1883, at the stables of his owner, Figueroa street, Los Angeles.

Description.

BOB MASON is a mahogany bay, with inside of off hind ankle white and star in forehead; sixteen hands, and weighs 1,100 pounds. Foaled May 10, 1879. He is of fine, kindly disposition, a natural trotter, and has shown great speed, but as yet has no public record. For full history of his sire, Echo, see BREEDER AND SPORTSMAN July 29, 1882. See also, for his full brother, Exile, BREEDER AND SPORTSMAN, issue of September 16, 1882.

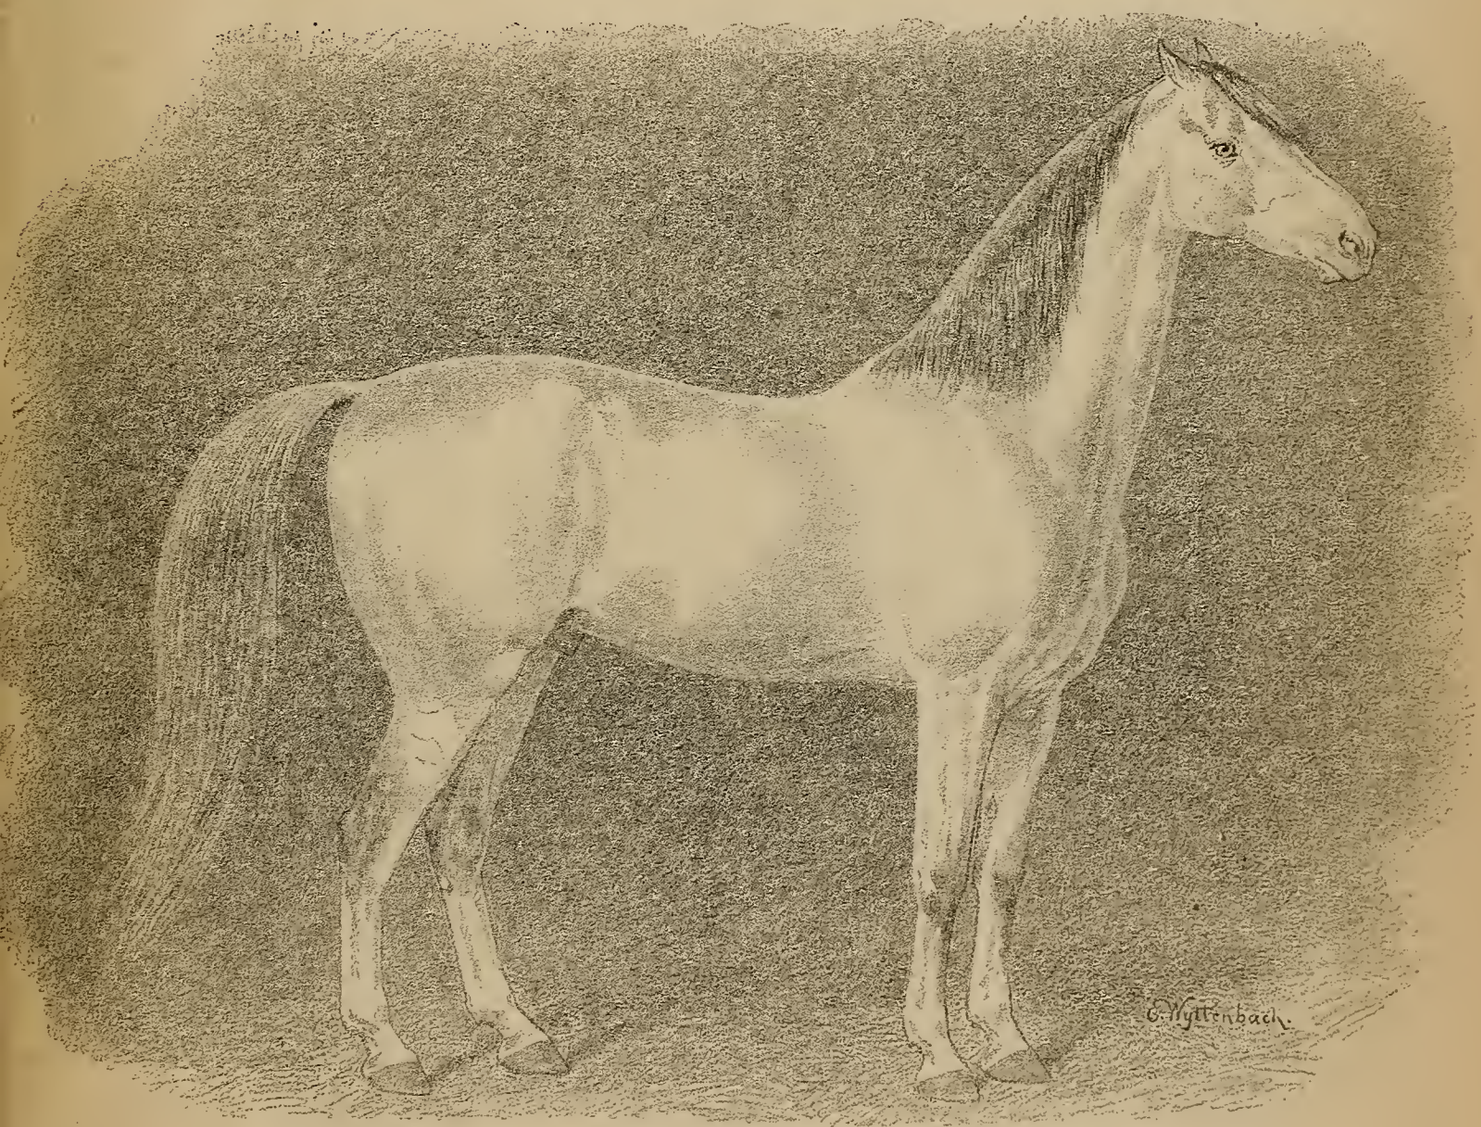
TERMS.

One hundred dollars the season, payable at time of service. All mares at risk of owners. Mares not proving in foal can be returned the following season free of charge. Address

CHARLES J. ELLIS,
Los Angeles.
Post Office Box 55.

BREEDER AND SPORTSMAN

Vol. II. No. 6.
NO 508 MONTGOMERY STREET. SAN FRANCISCO, SATURDAY, FEBRUARY 10, 1883. SUBSCRIPTION FIVE DOLLARS A YEAR.



POSCORA HAYWARD. Owned by Newland & Pumyea, Oakland, Cal.

We mnst acknowledge great pride in the portrait gallery of the BREEDER AND SPORTSMAN.

The twenty-three illustratione are not only works of art, they are as nearly exact representations of the horses portrayed as can be, and then it is something of which the whole people of the State may he proud when the evidence is so direct of there being so many horses of high form in the pro creative ranks. Not hy any means that the illustrations exhaust the "notahilitiee" of the Coast, as there are a large nnmher still awaiting to he enshrined, and when the joh is fairly, nnder way (it never can be completed) this conntry will preeent the most convincing proofs of the euperiority it has so firmly eetablished of its advantagee for the hreeding and rearing of fast horsee, and fine ones, too, of every description.

The enbject of the present sketch has always been a prime favorite of onrs.

From the firet time we eaw him move when a colt the assurance was felt that he wonld make a very fast one, and this estimate he has corrohorated, notwithstanding anf amount of bad luck and qnite a long chapter of accidents.

Ae has heen the practice heretofore in writing these sketches, the family from which the animal sprung has been given a due ehare of attention. This is manifestly proper, as all breeders are aware that the ancestry has a great deal to do in marking the character of the offspring—even the remote ancestry, as the cases of reversion for several generations are so well eatahlished as to be accepted without further argument.

People err when they think that the merits of sire or grandsire will make amends for ehortcomings in the animal which it is the intention to use, hut when there is individnal merit "hacked" hy sterling qualities in the progenitors, the risk attending the first stages of hreeding is reduced to a minimnm.

In the case of Poscora Hayward there is no neccssity for recapitulating the origin of the great families of trotters that have sprung from the imported Barh Grand Bashaw, as that has heen given in the preceding chapters.

The lines of Bashaw and Messenger incorporated in the eon, Young Bashaw, and these again reinforced by some of the stontest hlood of the racecourse, could not fail to produce excellence. Throngh the snccessive etages of Andrew Jackeon, Henry Clay and Cassins M. Clay there was a joint inheritance for the Moors and Patchens. Long Island Black Hawk, and throngh him the Green's Bashaws, the Mohawks, the Elmos, Buccaneers, etc., diverged a generation sooner, thongh they are of the trihe, and it wonld he an extra-hidebonnd stickler who did not acknowledge the high

occupied by the members of the clan. In this instance it will be sufficient to commence with the son of Cassius M. Clay, Geo. M. Patcben. His right to the stallion championship of the United States was unquestioned. He was not only the fastest, but was also endowed with other qualities that added to tbe luster of his name. Grand size, high form, splendid actiou, endnrance, stylish, etc., he united nearly all the desirable characteristics for a harness horse. His record of 2:23½ made August 2, 1860, is equivalent to much faster time at tbe present day, aud when his daugbter Lucy made 2:18¼ at Buffalo iu 1872, there is scarcely a question of her ability to bave gone several seconds faster.

Through the sou of George M. Patcben, best known by the title of Califoruia Patchen, Poscora ohtains a strain of blood which has mixed very kindly with that of Ahdallah. This was imported Bellfouuder, and we never could understand why the pedigree of that horse as given by Mr. Boots, at one time an owner of Bellfounder, and a geutleman of intelligence, should not be received, only under the assumption that the viruleut hostility in relation to the blood of the thoroughbred in the trotter bliuded tbe vision. At all events Rysdyk's Hambletonian has so completely overshadowed any other son of Ahdallah tbat credit must he given the daughter of Bellfonnder for having a sou of such high renown, and the blood of her sire a potent factor in the result.

In the "Breeder's Trotting Stud Book," tbe dam of Geo. M. Patchen Jr. (California Patchen) is giveu as by Top Bellfounder, second dam unknown. Wheu he was bronght here in 1862 by Wm. M. Heudrickson, the pedigree was extended in the advertisement to "grandam hy Messenger Eclipse," and the statement was also made that sworn certificates "to prove the correctness of his pedigree can he seeu at tbe stahle."

This horse judged by the usual standard has been more successful than his sire. Six of his get are iu tbe 2:30 list, viz.: Sam Purdy (2:20½), Vanderlynn (2:22), Starr King (2:22), San Brnno (2:25¼), Susie (2:26½) and James D. McMann (2:28¾). Starr King aud Vanderlyun are likely to reduce their records, last season being Vanderlynn's first trotting, aud hoth he and Starr King having shown a flight of speed that will warrant an expectation that the teens will he conquered.

As Poscora has always heen a prime favorite with us, his sire Billy Hayward has not been without claims to consideration. An honest, game horse, willing to do his best under all circumstances, and to exceed expectatious in nearly every instance. He could rattle as many heats "close to thirty" as the daylight would give opportunity for, and when the heats were lengthened to twice the distance he was still hetter snited. Of higher quality than a majority of his sire's get, with a magnificent set of legs, and a general wiriness of frame which Poscora has fallen heir to. Tbough the pedigree of the dam of Billy Hayward, Peauuts, is unkuown, there is not a doubt of there being plenty of racing blood. Her form, that of her son, and still more palpably that of her grandson show the inheritance.

Now, cattle do not have a striking resemblance to some well-known and long-estahlished strain without they possess some of the blood, and it is not likely that there is a marked resemblance to the thoroughbred without auy of the lineage.

The whole of the family of Peauut show the resemblance. Sweetbriar from a sister of Billy Hayward is a mare of a deal of quality and the brothers of Poscora are of the same class. Dr. E. H. Pardee has a "full brother" that is one of the finest roadhorses in the State. He is the largest of the lot, being sixteen hands, and very rangy. He is a dark chestnnt, the color of weather-stained bronze, and ae he has hauled the Doctor, who is on the heavy weight order, and his not very light roadwagon in thirty-seven seconds through the stretcb, it is beyond dispute that proper training would result iu a very fast animal.

There is another promising brother of Poscora, hut the the "talent" in the Billy Haywards is not limited to this one family. Alonzo Hayward ohtained a record of 2:30 and Hayward Chief 2:31, and both have shown a much faster rate. There are other valuable qualities hesides speed and endnrance, as we never saw one that had not a good temper, and Poscora is one of the "hest disposed" horses in the world.

He commenced his trotting career when young, winning several stakes, and gaiuing a four-year-old record of 2:30. Since that age there has been a cbapter of accidents. The serious accident to his then owner, A. Newland, by which he was rendered totally blind, threw him out of training or, at least, so disarranged matters that this strong stable of trotters was rendered of little avail. The season of 1881 opened auspiciously for him. After he was brought to the Oakland Trotting Park ho improved very rapidly, showing trials in 2:23, and making tbat fast time with such appareut ease and trotting so steadily that it was thought noue stood a better show in the classes he was engaged in.

Tbcn came the bano of fast borses. He etruck or straiued his leg so badly tbat he becamo lame, and, although he was entered throughout tbe circuit, he could not he started. Last year was ouly different in tbe disahility happeuing after he had trotted in a few races. His first race was on the Bay District Course, August 12, aud a description of that, which we wrote at the time, will give some idea of what sort of a trotter be was, though palpably lacking condition:

The 2:30 race was called after two of tbe heats in tbe 2:25 had been decided, hut owing to tho delay in scoring, the horses were sent to the barn until tbe tbird beat of that was decided. Tbis was regarded so sure a thing for Sweetness that sho was an immonso favorite; and tbe injury to Albert W, wbich necessitated bis withdrawal, was thought to take away the only cbance of defeating her. Poscora Hayward was not supposed to be in proper condition, and that it would require a race or two hefore he could show his capacity; and Blackmore was not credited with the speed he exhibited iu tbe latter part of tbe race. Sweetuess sold for $100 in the pools to $25 on hoth the others, aud after the first heat there were none to venture at even these odds; and when the second was scored to her credit, it appeared that it was a "tau-yard to a ehoe-string" that she would prove the victor.

For the first heat a very good start was effected at the third score; Blsckmore had the pole, Poscora second, Sweetness on the outside. Poscora went off rapidly, and though he made a hreak soou after the word was given, he led at the quarter in 0:36¾; Sweetness second, Blackmore several lengths in the rear. Going down the back stretch Poscora again broke, and tbe mare passed him and opened a wide gap at the half-mile in 1:12½. From that point home she had it all her own way, for, though tbe two greys closed the gap somewbat ou the bomestretcb, they could never reach her, and she won in 2:26; Poscora second.

The secoud heat, another good start was given them, on the fifth score, the mare going away with the lead, reacbing the quarter in 37½ seconds. Poscora drew np a llttle closer on the hackstretch, and his nose was on her wheel as the half-mile was made in 1:13, but he hroke on the further turn, fell hack, aud the mare came in a "handy winner" in 2:26, Poscora ahout as far hehind her as Blackmore was in tbe rear of him, a little more than an open length markiug the difference between each of tbem.

The third beat was one of those startling episodes which add so much to the pleasure and excitement of turf and track sports. There was scarcely a man who had any knowledge of trotting affairs who did not think tbe race was over, unless the driver of Poscora Hayward cherished the hope. The owner certainly considered it the most forlorn kind of an expectation, as he knew that his horse was uot in the proper condition, aud though he showed a fair degree of speed at times, he could not hold without hreaking. There were numerous false starts. Thirteen times they came up for the word withont avail. Blackmore on tbe outside would break into a mad run despite the efforts of his driver to restrain him. Then Poscora would follow, tbough his tantrums were more after the dancing order, while Sweetness, acting as though tbe trot were her fastest gait, came steadily and last every time, and, when all were trotting, generally in the lead. For this the judges fiued Goldsmith $10, and at the fourteenth effort the gong sounded, Sweetness having rather the hest of the start. It was evident that Goldsmith was determined to "go for a record." The mare has a had leg which may incapacitate her at any time, and she is the dam of a fine colt by Santa Claus, which will be greatly increased in value hy his mother's record being very fast. She bas speed enough to trot in the teens, and with sire and dam below 2:20, the youngster would fall heir to an estate well worthy of a severe trial to obtain. Laudahle as the intention was, there is scarcely a doubt that it was the cause of the loss of the heat, and, worse than that, led to a bitter end, as the sequel will show. Sweetness was first at the quarter in 37 secouds, and after leaving that point and when the curve merged into the straight, she was showing a grand flight of speed. Thirty-fonr seconds was the time for the second quarter, and the half-mile in 1:11, left the others far in the rear. Poscora had broken about midway of the first turn, though after that he trotted steadily and without a mistake until a short distance beyond the three-quarter pole. Some of the space between him aud the leader had been closed, and wheu he recovered he came again with great resolution, while the fast work had told on the mare. He was surely gaining very rapidly when the seven-furlong pole was passed, and at the long distance he was almost level with her. There was excitement among the spectators, aud the ringing cheers appeared to animate him, while the mare, who had gamely struggled until the brain could not endure further strain, and the muscles were without elasticity, could not respond to the punishment—fagged, dispirited, beaten—as the successfnl horse passed uuder the wire iu 2:25, Blackmore a fair third.

The tiring of the mare was so evideut that there was a rush for the pool-stand to "get out." The first pool sold it was $70 on Poscora to $20 on tbe other two; the next it was $60 to $27, and after there was time to cousider that her driver would not again make the mistake he had in tbis heat, and the desire to hedge by those who stood to win on the horse from the start, the odds were reduced to $60 on Poscora to $40 on the others. There was a large amount of money went into the pool-box between the close of the third heat and the start for the fourth. Had the scoring been prolonged the pools and bar would have shown a hetter dividend. But as it was, the signal was given the first time the horses came up, and a capital start it was. Blackmore broke at the farther end of the stables, Poscora trotted fast, and when within one hundred yards of the quarter-pole had obtained a good lead of Sweetness. He broke and she closed some of the intervening distance. About the same uumber of yards heyond the quarter-pole he broke again, and she rauged alongside. A hundred yards farther there was another break, and she passed him, and there was open daylight between them. He regained some of the lost ground, though she still led at the half-mile. His nose was on her wheel as he steadily gained, when half way round the upper tnrn he broke again. She drew away; Blackmore gained on him. The fractional timers had left the reporters' staud, and the time at qnarter, half and three-quarters was Jackiug. Soon after getting into the homestretch the whip of Goldsmith could be heard, and the whish through the air and the thud as it struck was evidcnce that Sweetness was again succumhing. At the ⅞ mark they were abreast. At the two-mile distauce Poscora was three lengths in the lead and his driver apparently more intent to keep him from hreaking than desirous of increasing the gap. He was on the outward side of tbe track nearly as far away as he could get to escape the irritating sound of the lash, hut just before coming to the score Poscora hroke, lost at least a length, recovered and came in two leugths in the lead; the time 2:29½.

There were complaints entered hy Green, the driver of Poscora, that Goldsmith had placed the hut of his whip iu the spokes of the wheel so as to canse Poscora to hreak when they were going down the backstretch. This was corroborated by McConn, the driver of Blackmore, aud Green was confident that the sulky spokes would show the abrasure. Goldsmith denied the charge, and countered tbat Poscora bad run. There was some consultation betweeu the judges, the bell was rung, Sweetness declared the winner of the heat and race and Poscora given second place. The announcement was received with tbe applause of those who had unexpectedly won, the groans and hisses of others. The reporter's stand on the Bay District Course is not favorable for an uninterrupted view as if it were on the outside of the course, hut this disadvantage is also shared hy the judges. When the horses first come ou the homestretcb it is troublesome to tell their positions or to notice a skip, and the going around the tunnel which incloses the stairs which lead to the upper story is a serioue obstruction. It is one of the hardest jobs, however, to get the people out of the old-time ruts when horses or race tracks are the questions at issne, and it will prohahly he another generation which will see the judges' staud universally on the right side of the course. Tbe followiug is the

SUMMARY.

Same Day—Two-thirty class; purse $500; mile heats, 3 in 5, in harness; $350 to first, $100 to second, $50 to third horse.

J. A. Goldsmith names s m Sweetness	1	1	2	1
W. D. Hammond names g h Poscora Hayward	2	2	1	2
Hy. McConn names g g Blackmore	3	3	3	3
A. Waldstein names b s Alhert W	drawn			

Time—2:26, 2:26, 2:25, 2:29½.

After this race he was taken to Santa Cruz where he beat Frank Moscow and Blackmore, and then went to Santa Rosa. Pinkeye sized him, and still he trotted a game race, making a dead heat with Alhert W in the fourth, secoud to that great colt in the fifth and sixth heats. He was second to Alhert W at Petaluma, beating Inca and Blackmore, and the next week at the Golden Gate Fair iu the first heat of the 2:30 his leg gave way, an d be had to he pulled up.

The supreme test for a stallion is the colts which he shows. And though the oldest of the get of Poscora in trainiug are foals of 1881, they already show so well as to give promise of high excellence. Alcazar, hy him and from A. Rosl, by The Moor, is said to have trotted quarters when a yearling in forty seconds, and as be has been selected from among all of the fine colts at Rancho del Paso to represent that great hreeding farm in the Stockton Stake, nothing more is required to fix the standing. We saw this colt a few months ago, and can unqualifiedly give bim the credit of fine form and good size. This is a characteristic of his progeny, so we hear from reliahle sonrces.

There is little to add in the way of description as the engraving produces his form with almost exact fidelity. It even gives his color, which is nearly white, and the "pose" is lifelike, though those who are not acquainted with the horse thiuk that the artist has drawn him ratber too airily.

He is very much after Arab Model, excepting that he is a hand higher than a majority of Arabs, heing 15¾ hands.

He was bred hy H. A. Mayhew, Washington Corners, California, foaled in the spring of 1874. By Billy Hayward, his dam Poscora Maid, hy Learned's Poscora, grandam hy Homer's Black Hawk.

YACHTING.

Death of a Famous Yachtsman.

Captain Robert Fish, the well-known yacht designer, died on Jannary 17th at his residence in Pamrapo, N. J., at th age of seventy years. Captain Fish was born in New York city, and served his time as an apprentice with Mr. Francis, who was the inveutor of the metallic life-boat. He hegan husiness for himself as a boat-huilder in Front, near Chambers street, and in 1840 removed to No. 104 Water street. The firm was successively Fish & Clark, Fish & Morton and Fish & Fletcher. Captain Fish's great success in the way of modeling of small open race-hoats induced Mr. Pierre Lorillard and other well-known yachtsmen to employ him in designing larger vessels, and, dissolving his firm in New York, he estahlished himself at Pamrapo, N. J. The sloop Eva, which he designed for Mr. George Lorillard, was a great success. She was afterwards altered to a schooner and won many races. In 1867 the Messrs. Poillon, of Brooklyn, built the schooner-yacht Sappho aud seut her to England, where she raced and was beaten. On her return she was purchased hy Mr. W. C. Douglass, and was placed in the hands of Captain Fish for alteration. He recommended "hipping" her—that is, adding to her beam at the water-line. The plan was opposed by her original builders, and there was much newspaper controversy at the time in relation to the matter, Captain Fish staking his reputation on the plan which he proposed. The alteration was made under his supervision, and the resnlt is well known. Captain Fish went in the yacht to England, where she won three successive races around the Isle of Wight. On her return she was one of the four schooners chosen by the New York Yacht Clnb to compete with Mr. Ashbury's schooner the Livonia for the America's Cup, the other three being the Palmer, Columbia and Dauntless. In the one race which she sailed with that schooner she was successful, and won the reputation of being the fastest schooner-yacht in the world. Captain Fish also designed the schooner-yacht Meteor for Mr. George Lorillard and the schooners Wanderer and Enchantress for Messrs. Pierre and George Lorillard, which were built side by side at Greenpoint hy Mr. Samuel Pine. All three of these yachts proved very fast. The number of open race-boats designed by Captain Fish is very great aud all of them have been successful. Captain Fish was social and genial in his habits and was liked and respected by all with whom he came in contact.

The amateur who huilt the yawl Chiquita last year has nearly completed a very handsome little yawl 10 feet long, on a model which has been tried. She will he used to row or sail.

Farmer of Oakland has jnst finished a 24-foot plunger for Carquinez straits. She draws very little water and has great deck room forward. She is of haudsome model.

The new 40-foot yacht being built up by Stoue is planked up and the cabin nearly completed. The cabin arrangements are similar to those ou the Rambler.

This wiuter we have had good weather for catamarans. There has been no wind at all and consequently very smooth water.

On Mr. Tevis' new yacht there will be 107 blocks, all of which are being made of fancy wood iu Boston.

Commodore Harrison is talking of taking the Frolic up to Puget sound next summer.

Mr. Bowie, formerly owner of the Nellie, has gone East for a while.

The Spreckels yacht is very nearly completed.

Mist is at moorings in Oakland creek.

Tbe Clara is still iu commission.

Bessie is now on Oakland beach.

Lolita is still up river.

BASE BALL.

Pitching.

Tha delivery of tha ball to the bat—technically termed "pitchiug"—dnring tha season of 1SS2 was characterized by a greater degree of strategic skill than ever before kuown in the annals of professional play. Tbe pitchers of tbe professional teams hava heen taught by experience that, whila mere speed and the curve may ba effective against weak batsmen, tbesa featnres of pitchiug are of secondary importance to strategic play, or "headwork," in tbe dalivary of tha ball. Tha old plan of sendiug in swift curved balls, without any idea in tbeir delivery sava tbat of pitching as swiftly as possible, and as near tbe plata as tba strictness of tha umpira may require, has seen its best day, and now mere speed in pitching bas been replaced by effectiva strategic combinations, bymeans of whicb a competent "beadwork" pitcber contrives to out-manenver the most axperienced batsman. Tbe pitchers of 1SS2, in a majority of instances, were materially obstructed in their strategic plans in pitchiug by the want of catcbers to suit tbeir special method of delivery. Pitching by signal has come to be a brauch of the art, and unless the catcher is in perfect *rapport* with tbe pitcher in this respect tha fnll advantage of the latter's strategic play cannot be obtained. It is almost impossible for a catcher to back up his pitcher with the best effect unless he is thoroughly posted in the signaling, so as to know what kind of ball to be prepared for; whethar an in-curve or an out-curve, a swift hall or one dropped short, or for a ball to throw to bases, or one to be qnickly returned. In fact, the catcber should be perfectly familiar with all the poiuts of play of the pitcber, or it is next to impossible for the latter to deliver the ball with his best effect. Team-work for pitchers and catchers has come to be a necessity of tha game in a thoroughly well-managed professional nine; and by "team-work" we mean that combination of all tha elements of successful play embraced in a nine which is worked so harmoniously together as to be run almost with the perfection of well-constructed machinery. In such a team playing for tbe side is a special featnre, while working solely for a record is not permitted for a moment. Pitchars play for their record whenever they pitch without due regard for their catchers. That is, in their striving to strika out batsmen by great speed, without due regard to the work the catcher is able to do in supporting their swift delivery, they are looking not to the success of tbeir team; but to ruuning up a high ratio of assistanca on etrikes. A pitcher who trusts mostly to making a record of this kind to achieve notoriety is not of mnch accouut as a team-worker, the cost of his record-style of pitchiug in nsed-up catchers mora than offsetting all ha may gain in striking ont batsman. Basides which, this striking-ont method in pitching has a damaging effect in lessening the attractive features of tbe gama. Of what interest is it to a general crowd of spectators to see two opposing pitchers hard at work sending in balls of "lightning force," with the result of striking ont eighteen or twenty players of the twenty-seven in a game, while seven of tha nine players stand in their respectiva positions almost as idle lookers-on, and while the beauties of baseball as exhibited in splendid pick-ups and hard-hit balls, fly-balls finely taken on the run, swift and accurate throwing to bases, plncky base-play, and the strategic points shown in the infield in the endeavors made to frustrate the efforts of daring base-runners, are all sacrificed to the monopoly of work hy the pitcher and catcher. To strike out batsmen by the mere forca of the speed of the ball is merely machina work in pitching, requiring no real skill or judgment, such as is needed in ordinary strategic play in the position. All tha pitcher and catcher have to do in snch a method of delivering the ball as to strika batsmen out by speed is for oue to throw in tba ball as swift and straight as he can, and the other to pass it back to the pitcher as it rebounds from the fence. Such work as this yields tha dullest kind of a game, wbile a style of pitching which brings into play all tha fielding skill of the whole team imparts an interest to tha match which makes a baseball contest the most attractive of all field-sports.

A featnre of the pitching of 1SS2 which we witnessed was the strategic point of a qnick return of the ball, by which batsmen were canght nnprepared for an effective hit. This was the stroug poiut of Lynch's pitching in the Metropolitan Clnb team. To work it with effect it is necessary that the catcher shonld be very prompt in his return of tbe ball, especially when he notices that tha batsman is temporarily out of form for hitting. In snch quick returns the ball sent in mnst inavariably be over the plate and at the right height, or the retnrn will not be of use. Clapp was very strong in his support of Lynch's play in making prompt retnrns of the ball to the pitcher. Considerable nerve was showu by some pitchers of 1SS2 in bearing pnnishment well. A pitcher who cannot stand tha punishment of a few extra base-hits made on him in an inning's play, without losing confidence in himself and becoming demoralized, is not au effectiva player in tbe positiou. Tha most effective pitching ever known will, at times, be badly punished, and as batsmen learn more of the real art of batting this punishment mnst be more frequantly administered. There was one thing wa greatly enjoyed in tha season's play at the Polo Gronnds in 1SS2, and that was to see the heavy hitters of a team outmanenvered by skillful, strategic pitcbers. Yonr heavy hitter, as a rule, is always one of the easiest victims to a well-trained pitcher. He never loses sight of his record, and, in his eagerness to make his favorite "three-bagger" or home run hit, he does not see any of the little traps the strategic pitcher sets for him.—*N. Y. Clipper.*

More college players will enter the professional arena in 1SS3 than ever before. The latest acqnisitiou is Humphreys, the catcher of the Cornell College nine of '82, who will become one of the New York League Clnb's team after he gradnates, next June. He excels in throwing to bases, and is a fine catcher in othcr respects. He is over six feet in height and ie powerfully bnilt.

Sportsmen's Club.—Pursuant to notice a meating was held at the City Hall last evening, to organize a aportsmen's club, having for its object the enforcement of the game and fish laws. Warren Jones was callad to tbe chair and J. M. Malendy chosen secretary. On motion a committee on by-lawa was appointad, consisting of E. W. Wilson, Warren Jonea and J. T. Kellehar. On organization, Peter Belcher, J. E. Barnard, W. S. Kapple, W. L. Mercer and C. Schroedar. Adjourned to meet Wedneaday evening.—*Eureka (N. B.) Times-Telephone.*

The Reno *Gazette* notes the shipment by Wm. Smiley, of Daeth, of fifteen car loads of baaf cattle for San Francisco and adds: "This closes out the last lot of baef cattle on the Humboldt above Elko and above Winnemncca except Dunphy's at Battle Mountain."

TURF AND TRACK.

Horses in Arizona.

Six years ago a pleasant turn in tha wbeel of fortuna carried me into tbe valleys and monntains of that rich mineral and graziug country, where my field of observation has been wide aud my experiences in breeding considerahle. From my early boyhood the horse has been my almost constant companion and my truest friend, aud it is with pleasure that my thoughts turn upon him in whatever field ha is fcund.

A few months of carefnl observation and the statements of raliabla men, residents of the Territory from its earliest settlemeut, fully convinced me tbat tbere was not anotber such a favorable country under tba sun (not even excepting the wonderful blue-grass region of Kentucky) for pleasant and profitabla breeding of the horse. Arabia, from whence came tba hot blood tbat now courses through tbe veins of tbe wonderfnl and unequaled trotting and running horses of America, witb her dry and arid plains and clear electric atmosphere, in those and otber respects is so much like the Arizona country as to jnstify me in speaking of my adopted home in the horse-breeding sense as tbe Arabia of America.

Tbe elevation being several thousand feet above tbe level of the sea, it gives ns a clear, dry and electric atmosphere, at once giving health of body and strangth of spirit to tbe borse. Tha soil is dry and sandy in general, and in many places covered with gravel and broken ledges of rock, tbe grazing and running upon which by the young and growing colt, gives him a hoof at maturity so firm and solid as to withstand the wear and tear of the rough aud rapid road and turf nses to a wonderful degree. Our horses raised, as they are, from the first day of their colthood ruuning in bands or herds with other horses, gathering their own provender from mouth to month and year to year, unhaudled and unfed by the hand of mau, acqnire a stoutness of bone and muscle, a soundness aud security of hoof, a strength of will and courage that make them stroug competitiva horses in tha market of tha world when bred with care from the better strains of blood. Tha native horses of Arizona are a small and almost useless Indian pony. At different times and placas, crosses have been made upon the native mares by better stock and thns a race of animals has been produced quite snitable for ordinary use in handling herds of cattle. From time to tima, from the earlier days of settlement, mares of better breeding in harness aud in herds have beeu driven into the territory from the Easten States, and the Pacific Coast. These mares and their produce, having beeu crossed with selected stallions from year to yaar by a few judicious breeders, have laid the foundation for grand and profitable results in the problem of advanced breeding. Speaking more to the point and specifically, I will proceed to state a few facts of a local and general bearing npon this snbject. About three years ago, Henry Herbert, of Prescott, Arizona, purchased in California a band of well-bred mares, with two stallions of approved breediug, which he drove into the territory, and placed on a ranch in the vicinity of Prescott. These mares bave produced some exceedingly promisiug colts, from the stallions accompauying them. One of the stallions is knowu as George Patchen and was sired by George M. Patchen Jr., commonly called California Patcheu, and he by old Geo. M. Patchen.

The dam of Herbert's George Patchen was a very fast and game trotting mare taken from the State of California for tha pnrpose of being used on the turf. The other stallion brought in with this band of mares was a yonng thoroughbred who reached an untimely death, the result of a fearfnl struggle for mastery with the Patchen stallion, from an accidental getting together, dnring the night, when no one was around to separate them.

Col. C. P. Head, a wealthy merchant of Prescott, interesting himself with Dr. O. Lincoln of the same city in the Herbert band of mares, purchased within the past year in tha California market a magnificent and royally bred two-year-old stnd colt, sired by A. W. Richmond, the sire of Romero. I think this half brother to that wonderfnl young horse Romero has been given tha name of Ben Bolt. This fina colt of Col. Head's ie large and stontly bnilt, and will grow into a grand and popular horse. Already he has shown his owner, who bas broken him to harness, evidances of speed akin to that already exhibited by his brother, Romero. The Colonel also has a large and fine looking thoronghbred stallion with Bolt and Patcben in tha above stud of mares. Jerry Snllivan and other breeders in tha vicinity of Prescott have cansed to be taken into that section of the country other expensive and well bred stallions with the names and breeding of which I am not familiar.

It will not be immodest in this connection for your subscriber to say that ha has himself gotten together a goodly number of the choicest bred mares he could find in the Territory, from most of which ha has beeu raising colts sired by a well-bred stallion which ha pnrchased in Nebraska at a high price when it was hut a colt. When this colt was but fiva years of aga he was riddeu from the Missouri river country over prairie, plain aud desert, into the monntains of Arizona, a distance of over 1,500 miles. The colts from the loius of this horsa are attracting a good daal of attention aud command high prices. They ara universally large aud spirited, and in a very marked degree show the style, color, poiuts and trotting action of their sire. This stallion is a large, bright bay, with dark points, 16½ hands high. When two and threa years of age, he was awarded first premium at the State fair in Nebraska, as being the best in his class of roadster stallions. He is registered in the "American Trotting Stud Book" as Hambletonian (Gosper's), b h, foaled 1873, bred by William Montgomery, Marshalltown, Iowa, owned by Johu J. Gosper, Prescott, Arizona; by New York Boy (son of the Barber Horse, by Milliman's Bell Founder), dam Beauty, by Jackson's Black Hawk Messenger (son of Hill's Black Hawk), second dam a fast road mare, said to be of Messenger's descent. Traced to tbeir legitimate sources, we find two strong currents of blood running in the veins of this borse, known as the Meseenger and Morgan. Something over a year ago, tha writer purcbased of Gaueral Withers of Lexingtou, Keutucky, a choicely bred young stallion, aud had him shipped to Arizona to ba usad in the stnd, in connection with and to cross upon tha produce of Hambletonian. This colt will ba threa yaars of age naxt Jnna, and is registered in the "Standard Trotting Stnd Books" as Exemplar, b h, foaled 1SS0, brad by William T. Withers of Laxington, Kentucky; by Almout, son of Alexander Abdallah; dam Viella, by Strader's Cassius M. Clay Jr, son of Cassius M. Clay; second dam by Alexander Abdallah, sou of Rysdyk'a Hambletonian. Iu Arizona Exemplar is known as Gosper's Almont, and we desire to bave the last name given to him in the trotting stud books of the country. Gosper's Almont is a bay, and wbeu matured will make a horse full aixtean hands higb. Lika the royal family of Almont trottars he ia fnll of promisa as a sire of trotters, and of becoming a very fast trotter himself. To thosa familiar with tba present popular familiea of trotting borses, it is a well-known fact that Gen. Withers' Almont is the sire of some of tha fastest and higbest-priced trotting borses in tba country, prominent amoug them being Piedmout with stallion record of 2:17¼, recently purchased by ex-Governor Stanford, of California, at the euormous price of $30,000; Early Rose and Aldine, owned by W. H. Vanderhilt, tbe great railroad man of New York City, and for wbich it is understood ba paid $35,000. These mares each of them have a public record in the select and charmed circle under 2:20. During tbe past summer they were driven togetber in doubla harness on a mile track in tbe nnequaled double team time of 2:16¼. Fanny Witherspoon, also, with a public record under 2:20, owned by Commodore Kittsou, of Minnesota. With such strains of blood as are herein indicated, judiciously bred upou and crossed witb the best mares of the country, and the get of one of eitber of the above stallions bred upon by the other, will not fail to prodnce favorable and startling results in tbe field of breeding. I think I can predict with almost the certainty of ancient prophecies that the conutry about Prescott, Arizoua, will become in tbe near future a center from which will be shipped richly bred colts and fillies for the road and turf, and for the pnrpose of improviug tba cold strains of horse blood throughout tha western country. Certain enterprising citizens of Prescott bave organized into a propar association and bave within tbe past six months completed a good mila track, and provided other conveniences for training and testing the running aud trottiug qualities of the high bred horses of that section, and dnring the fall a series of spirited races was had upon tha track. Other facts of interest to the horse breeding world centering in the abova named locality might be added hereto, but presuming thesa lines hava already reached a number greater than you will care to publish, I will bolt the track and possibly start again.—*J. J. Gosper in Dunton's Spirit of the Turf.*

The Logic of the Turf.

An interesting bit of tnrf law was pnblished in ona of the Chicago sporting papers last week. As tbe construction of the law emanates from the clear-headed secretary of the National Trotting Association, for preventing fraudnlent practices and purifying the turf, the article possessed nnusual interest.

In answer to the qnestion if Kittie Fisher was suspended for trotting under a false nama (Nettie C,) last season, tbe secretary replies that, as sha trotted over the tracks of non-members, the National Association has no jurisdiction over her frandnlent performances. He also informs her owner, or owners, that if they wish to trot Kittie Fisher, Nellie C, or what other name she may be known by, over tracks of the National Association hereafter, all they have to do is to walk up to the Captain's office, pay their littla fifty dollars for a change of name, aud trot wben and whera they please as long as they please and find it profitable. When, however, tbey see more money in a Jessie James raid, all thay have to do is to change the name of the little joker and fleece the countrymau. "We will take you into full communion again as soon as you will send in your littla fifty for chauge of name, and you can once more grace tha qnarter-stretch of the Circuit tracks."

Such is the status of the ringer when trottiug over non-Association tracks, but the same fraudulent practice over a member's track brands the perpetrator as an outlaw forever "over onr tracks."

We also fiud it stated as good turf law that Mr. Brown, who is an extensive breeder and honest citizen, by permitting his colt to make an exhibition at his conuty fair, where no time is giveu from the judges' staud, makes an outlaw of himself and his colt is debarred the privileges of National Association tracks, while the Artfnl Dodger, in full communion, is "one of ns," and he can enter his nag over tha Natioual Associatiou tracks and pnll her to his heart's content.

If tnrning a lot of ringers loose upon the countrymen at their conntry fairs wonld have the effect (which is undoutedly intended) of making the rural brothers take ont membership in the National Association, I should be deligbtad, for "it is a consummation devontly to be wished," bnt I fear no such good results will obtain.

The rule applying to "no time" races, I also heartily indorse; but hera is the point I would make: If the National Association has no jurisdiction over outlaws ou non-member tracks, what control has it over "no time" races? I thiuk it has the same jurisdictiou over the one as the other, aud regret tbat it does not assume the same powers in one instance as in the other. I know full well that there is a specific rule of the National Association that applies to "no time" races "on auy track." A broad and libersl construction of tha fraudulent entry rula night also be construed to cover "auy track." If not; why not? Tbe turf code is very elastic and seeme to bend to meet all emergencies.—*Breeder's Gazette.*

Pen Portrait of Fred Archer.—Tima is np, however, and hera comes "Freddy," the pilot of Dutch Oven. Tall in stature, and supple as a whip, with a good tempered smile on his faca when accosted by Matthew Dawson, who has so well grouuded him in his calling and conduct that it is well knowu ha has long ago acqnired a comfortabla iudependence by uever deviating from a straight course in tha exercise of his profession. Ha is, I think, tha tallest jockey of his weight uow in practice, and while he is cast in the mold of a horseman, his leugth of leg gives him an extraordinary grip on the saddle. Active as a monkey, with an eye like a hawk, he steps up to his splendid-lookiug mount and takes up his reins in the style of a cavalry soldier rather thau in tbe orthodox fashion of an ordinary jockey. When the ribbons are secured, he rests the bridle-hand on tbe withers of tbe mare, and with his right placed on the cantle of the saddle he qnickly raises his left foot, and Matthew Dawson placing his hand under the instep as a purchase, the jockey springs into the tiny saddle like a flash of lightning, while his feet are mechanically passed into the stirrups. All these motions, though distinct in thamsalves, are, as in the case of our cavalry soldiers, so qnickly performad that they daceive even the aya of tba initiatad, aud appaar as one effort. Steadily and stately tha bonny brown mare walks from the paddock, and, when she bas cleared tha crowd at the Turu of the Lands, canters gracafully to the starting-post for the Great Foal Stakes, near to the far-famed embankment, better known as the "Ditch."—*London Sportsman.*

Daniel Lambert has twenty-two of his get in the 2:30 list and although twenty-fiva years old is still vigorous. He is owned by Daniel Snow of Boston and is kept at North Andover, Mass.

Foals.—At Santa Anita on January 30, E. J. [illegible] mare Jennie D dropped a colt foal, bay with black [illegible] a few wbite hairs in forcbead, by Rutherford.

Louisville Jockey Club.

After a delay somewhat longer than customary the Louisville Jockey Club last week made public the entries to the stakes which closed on the 1st inst. Considering the large number of stakes announced, the total entry is not as large as was expected, yet on a whole it is a magnificent showing, the nineteen stakes obtaining 575 entries, as against 566 made for thirteen stakes opened for the spring meeting in 1882. The most interesting features of the publication are, of course, the two-year-old stakes, showing as, they do, the average class of youngsters that may be expected to come up during the current year. Nearly all the prominent Southwestern stables made entries. Mr. Pate who, it will be remembered, purchased Milton Young's stable last September, makes the largest entry, he putting six in the Alexander and three in the Louisville Ladies, while the average of the other nominators is about two. For some of the other two-year-old stakes Megibben shows up strong as also do Charley Reed, Bowen & Co., Captain Cottrill and W. Preston. For the three-year-old stakes there are a number of familiar names, including the promising Lord Raglan, Henlopen, Ascender and Bondholder. Among the Eastern-bred three-year-olds are Mr. Cassidy's Campanini, bred by Mr. Belmont, and the Canadian-bred Rody Pringle, by Helmbold. For the all-aged stakes there are a number that have time and time again reached the winning post first, including Monarch, Harry Gilmore, Ada Glen, Sannterer, Pearl Jennings, Fellowplay, Mediator, Freeland, Boatman, Monogram and many others. But perhaps a fair representation of the all-aged lot is shown by the entries for the Cup at two miles and a quarter, which is the fixture for the fourth day of the meeting. They are as follows:

C. Bell's Harry Gilmore (4), by Buckden.
C. Bell's Dave Tandell (4), by Buckden.
W. L. Cassidy's Blazes (5), by Leamington.
F. B. Harper's Freeland (4), by Longfellow.
C. L. Hunt's John Davis (aged), by Harry O'Fallon.
J. W. Lond's Lida Stanhope (5), by Waverley.
D. La Masney's Wildmoor (5), by Longfellow.
Morris & Co.'s Creosote (5), by Creedmoor.
Morris & Co.'s Apollo (4), by Ashstead.
McGavock & Co.'s Boulevard, (6), by Bonnie Scotland.
C. Reed's Thora (5), by Longfellow.
Stevens & Co.'s Farragut (5), by Wanderer.
Stemple & Co.'s Highflyer (4), by Hiawatha.
Stockland Farm's Mistral (4), by Virgil.
J. T. Williams' Checkmate (aged), by Glen Athol.
R. C. Pate's Boatman (4), by Bonnie Scotland.

The above is certainly a very representative lot, and they promise an excellent race, and if Mr. Reed's Thora should come out in anything like the form she did last spring, the race ought to be one of the betting events of the meeting. The total entry for the several stakes opened both in 1882 and 1883 are as follows:

	1882.	1883.
For two-year-olds:		
Louisville Ladies—five furlongs	45	40
Alexander—five furlongs	36	40
Tennessee—three-quarters of a mile	41	30
Runnymede—three-quarters of a mile	—	49
McGrathiana—five furlongs	—	40
For three-year-olds:		
Tobacco—mile heats	51	25
Fleetwood—mile heats	46	21
Richards Memorial—mile and a quarter	—	24
Woodburn—mile and a furlong	—	31
For all ages:		
Dixiana—mile and half a furlong	51	36
Cup—two miles and a quarter	26	16
Merchants—mile and a furlong	48	35
Magnolia—three-quarters heats	30	20
Swigert—one mile	42	34
Turf—mile and a quarter	60	39
Kennesaw—one mile	—	28
Nantura—mile and a furlong	—	25
Minnehaha—one mile	—	20
Macauley—steeplechase	—	22

—*New York World.*

Entries to the Stockton Stake.

Nominations for the two-year-old trotting stake of the San Joaquin Valley Association closed on the 1st inst. The subjoined list of the entries we clip from a Stockton paper but feel assured that it is incomplete. In the absence of any report from the secretary we give it as being to the "best of our knowledge and belief."

John Mackey of Sacramento, Alcazar; L. M. Morse of Lodi, Ida; J. C. Simpson of San Francisco, Antevolo; J. F. McIntosh of Chico, Sallie M; G. W. Trahern, Stockton, Voucher and Bracelet; A. A. Yeager of Vallejo, Nona Y; J. A. McCloud of Stockton, Monnt Veruon; L. J. Rose of San Gabriel, Bedonin and an unnamed colt; J. E. Dunham of Pacheco, Oscar Steinway; D. E. Knight of Marysville, Nighthawk; Charles Sherman of Chico, Chevalier; J. B. Tennent of Pinole, Pinole Jr.; E. Giddings, of Lemoore, Bay Rose; J. P. Burns of Pinole, Alert; F. L. Smith of Sacramento, Cora; A. L. Frost of Sacramento, Roscoe; Sargeant Brothers of Woodbridge, unnamed colt by Priam; Charles David of San Francisco, Mambrino Belmont; L. U. Shippee of Stockton, a sister to Honesty; also a colt by Nutwood; Palo Alto stock farm of San Francisco, Argo, Gypsum, Chiquita, Edos and Alban.

THE GRAND PRIX DE PARIS.—The grand Prix de Paris had a very narrow escape of not being run for the next season, as the Municipal Council of Paris has only by a very small majority agreed to vote the sum of £2,000 hitherto contributed each year toward the endowment of this race, and the other £2,000 being given by the great railway companies. The vote, which came before the Council on Wednesday, was strongly opposed by the extreme Radicals, who declared that racing was only an amusement for aristocrats and idle people, and that race courses were hotbeds of debauch; one member launching into a long discussion upon the doctrines of the late Mr. Darwin, whose name one would scarcely expect to find mixed up with racing questions. "Racing," the representative of Belleville observed, "was all very well during the Empire; but the Republic should not give any encouragement to one of the worst survivals of Roman corruption." Some of the most practical members of the Council, however, were of the opinion that the race for the Grand Prix attracted many strangers to Paris whose expenditure more than counterbalanced the grant of £2,000; after the exchange of some complimentary epithets between the two sections of Republican opinions represented in the Council, the vote was carried, though by a majority so small that the next is very likely to be the last contest for the race founded in 1864 at the instance of Duc de Morny.—*St. James Gazette.*

SIMPSON'S BLACKBIRD.—It is said on apparently good authority Simpson's Blackbird had at least a dozen colts with records, and well authenticated trials, of better than 2:40, one having a record of 2:22. This in his day and generation, with his surroundings, was certainly a remarkable showing, and the fact that he has had two grandsons, Romero and Little Fred, with records respectively of 2:19½ and 2:20, indicates that his blood breeds on well. While he was not strictly thoroughbred, he was substantially so, and we know of no running blood that we would as soon risk as a trotting cross. The advocates of running blood in the trotter might well experiment with and utilize this cross. It could hardly fail to impart good qualities and actual results indicate that it may be a factor in even great qualities. There is considerable activity in Iowa at present in picking up mares with Blackbird crosses.—*Davenport (Ia.) Democrat.*

ADIRONDACK.—This trotting stallion lately imported from the East to Portland, Oregon, to fill the vacancy caused by the death of Kisber, is black with tan flanks, white strip in his face, and both hind ankles white. He is by Bona Fide (son of Rysdyk's Hambletonian from Kate, by Belaire). First dam, Madge by Volunteer; second dam, Nelly by Alexander's Abdallah; third dam by Sherman Morgan. He was never trained and has a strong disposition to pace, but trots with a fine, open stride. He will be a valuable addition to the stock of Oregon and Washington.

James D. Snowden's gray mare Blue Bonnet by Tom Atchison—Hattie Bay, by Billy Cheatham, died at the ranch of J. T. McIntosh, near Chico, last Monday, of virulent pink-eye. She was successfully bred to Joe Hooker last spring and was due to foal about March 1.

BICYCLING.

An important meeting of the racing board of the League of American Wheelmen took place Jan. 10, at the Metropolitan Hotel, New York. The following members were present: S. A. Marsden, New Haven; Geo. E. Gideon, Philadelphia; and Fred Jenkins, New York. After an informal discussion of the prominent questions, the meeting was called to order at 8 p. m., and Mr. S. A. Marsden was chosen chairman, and Mr. Fred Jenkins elected secretary. The rules of the racing board were taken up one by one, and the following changes were suggested, and will be presented at the next meeting of the board of officers for approval:

Rule 1. The word "not," was stricken out from the sentence "whose games have not received the written sanction and indorsement of the League Racing Committee," as it destroys the sence of the rule. It now reads as follows:

1. Entries and awards will be confined strictly to amateurs; and persons entering for these races, who are not members of bicycle or other athletic clubs whose rules of membership exclude professionals, must satisfy the judges that they are not professionals, either by their own statements in writing, or otherwise. Any wheelman competing in races other than those held under the auspices of the league, or of a league club in good standing, or of an organization whose games have received the written sanction and indorsement of the League Racing Committee, will be disqualified from competition in future league races, unless this disqualification shall be subsequently removed by the Board of Officers of the League.

Rule 14 was amended to read as follows:

All championship races shall be held under the immediate supervision of the League or its constituent clubs, or the National Association of Amateur Athletes of America in conjunction with the league. No trotting, athletic, or other non-league organizations shall be allowed to hold State bicycle championships in which league members shall compete, without the special sanction of the Racing Board.

By this amendment it will be seen that championships must be given by the League, or the National Association of Amateur Athletics in conjunction with it. Privilege to hold State championships may be granted by League Clubs or authorized associations, when the importance of the meetings is sufficient to warrant the Racing Board's special sanction, although it is recommended that not more than one race be offered as a State championship during the year, and that meetings must be announced at least one month in advance, in order to give intending contestants ample time for preparation.

In accordance with the rules, an official handicapper remained to be appointed, whose duty it would be to frame handicaps for such clubs and associations as desired his services. Mr. Fred. Jenkins was then elected "Official Handicapper of the League," and the following fees were fixed as compensation for the service to be rendered:

A fee of one dollar for each race for which five or less contestants were entered and fifty cents for each additional five names. Employment of the Official Handicapper is, of course, not compulsory, but nevertheless recommended. After a short discussion, the following rules were adopted for those who desired the sanction of the League to their games:

Application for the sanction of the Racing Board, L. A. W., must be made to any member of the Racing Board, indorsed by a League officer or at least two League members, and a full statement of the character of the proposed races must accompany the application, which must be filed at least ten days previous to the date of the proposed meeting, in order to allow time for investigation. As it is not within the power of representatives and consuls or other League officers to sanction races, it is recommended that the *Bicycling World* and he *Wheel* publish regularly the names and addresses of the members of the Racing Board under the L. A. W. standing notice.

Should the application recieve the approval of the Board, a blank will be forwarded to the parties to whom the same is granted, which report must be filled out and returned to the secretary, accompanied by a list of field officers, or better still, a printed programme to be filed for reference. The Board is required to appoint a League member in the immediate vicinity of the races to see that the rules of the League are properly carried out.

At all race meetings, it is desired that the following officers be selected: A referee, two judges, clerk of the course, starter, and three time-keepers, who shall also act as scorers. At small race meetings, the number may be reduced according to circumstances, and it is not necessary that they be League members. But the Board requires that at least three time-keepers be on hand, one of which shall be a members of the League.

The secretary was directed to have copies of the racing rules and instructions printed and supplied to the members of the Board for distribution to any one making application for the same. Ignorance is no excuse for the violation of the League rules, and racing men are warned that if found competing in unauthorized games, they will be debarred from entering any approved races or the championship games of the League and National Association of Amateur Athletes of America.

The Racing Board recommend that the official measurement of racing tracks be the same as the English and American athletic standard, which is as follows: "The measurement of tracks shall be made eighteen inches from the inner edge, which edge shall be a solid curb raised three inches above the level of the tracks." In connection with this subject, the board wishes to state that it is their intention to recommend this standard to the Bicycle Union of England and the National Association of Amateur Athletes of America, so that the standard will be the same all over the world, and comparison of records rendered intelligent and comprehensive.

The Board recognizes all records made in the past on tracks exceeding this standard, and up to three feet, until the above amendment is adopted by the L. A. W. Board of Officers, but from what information at hand from reliable English and American authorities, they strongly recommend the eighteen inches measurement.

As the subject has met with some discussion, the matter was carefully looked into, and its advantages and disadvantages fully discussed. The board feels, however, that the appointing of an official handicapper will tend to make future handicap races satisfactory and do away with the necessary evils of the class system.

As the present rules provide that a start shall be made from a standstill (the competitor mounted on his machine, and pushed off by an attendant), they see no reason for recommending any change at present.

The Racing Board declines to sanction any race between an amateur and a professional, as tending to establish a bad precedent, and one not in accord with the N. A. A. A. A. The action of the board in the recent Prince-Frye matter was indorsed unanimously by the meeting.

In view of the fact that the two annual race meetings of the League have resulted in financial failure, it was decided to ask the Board of Officers, at the next meeting, to amend Rule 11 of the Constitution, to read, "Once a year, preferably in autumn, there shall be held a race meeting, under the anspices of the League and the National Association of Amateur Athletes, for which suitable championship medals shall be provided. These races open to all amateurs. There will also be a prize offered for the League Championship (distance, one mile), which shall remain the property of the League, until it shall be won three times by the same competitor."

There being no further business before the board, the meeting adjourned at 11:45 p. m.

FRED. JENKINS, Secretary.

BICYCLING IN BOSTON.—Three fairly interesting bicycle events occurred at the Institute Fair building, Boston, on the 20th ult. The first event was a five-mile straightaway race for the championship of the Bay State Wheel Club. There were three contestants, Frank R. Miller being an easy winner in 19:49½. The second race was five miles straight away, open to all amateurs; a gold medal to the first and silver medal to the second. E. Burnham won the gold medal; time, 16:26½; and E. A. Thompson the silver medal; time 16:26¾. The race which excited the most interest was the ten-mile straightaway professional race between John L. Prince, of Boston, and Lewis T. Frye, of Marlborough, for $600. It was won by Prince in 32:49. Frye did not complete the last lap.

The weather this winter has been exceptionally fine for bicycling, and most of the riders, especially those in Oakland, have taken advantage of it. Excursions are made by twos and threes to all the neighboring towns, extending the run to Haywards, Centerville and in some cases to San Jose.

One of the members of the Oakland Bicycle Club who was down at San Lorenzo last Sunday says the roads are in as fine condition as in Golden Gate Park. Several bicyclists will take a run down to San Leandro to-morrow.

It is thought there will be more "runs" and fewer races among the bicyclists next season. There is nothing in the racing and the boys enjoy the excursions exceedingly.

ATHLETICS.

The New York *Spirit of the Times* says that an Eastern gymnast performed the feat technically known as "chinning the bar" twenty-nine times, in an off-hand way, without previous training. Under the circumstances it was a good performance. A member of the Olympic Club of this city, under the same circumstances, has chinned the bar twenty-five times, and several others have chinned twenty-two times. We remember another feat accomplished by members of the Olympic Club that strikes us as a good one. As near as we can remember it was in the summer of 1870. The day had been extremely warm for this part of the world, and the class exercising in the evening wanted something different from the usual class exercise. About fifteen or twenty minutes past eight one proposed back somersaults, and another suggested that all should turn, and anyone falling forward on hands or face should drop out to see who would be the last to fail. An accident, or carelessness, not endurance, was really supposed to be the real test, and no one had any idea of what could be done. C. A. Bennet (deceased), W. S. Lawton, W. B. Cook and H. B. Cook, were the only ones to step forward. H. B. Cook turned something over 100 times, and carelessly, although not in the least tired, touched the mattrass with his hands and was barred. Bennet, Lawton and W. B. Cook kept on until about ten minutes past ten p. m., and were then compelled to stop (although neither of them showed signs of fatigue) because it was time to turn the lights out, having each turned 205 times. There was no hurry about the matter, and no loafing. One would step on the mattrass, turn and step off. Then another would take his place, and so on. H. B. Cook says that he does not remember whether he failed at 110 or 150. As long as four were turning each one had more rest than when there were but three, but all the time each one felt that he would be guyed by all hands if he showed signs of sinking, and was careful to take his turn without any unnecessary delay.

A wrestling match has been arranged to come off at San Jose this (Saturday) evening for $200 a side. J. H. Crawford and Thomas Fox are the contestants, each of whom have deposited $50 as an earnest that the balance of the stakes will be up on Friday. The match will be in accordance with Detroit rules.

GAME PROTECTION.

Views of Some Leading Sportsmen on the Proposed Amendments.

The proposad amendments to the game aud fish laws which have been formulated by memhers of tha State Sportsmen's Association have given rise to considerahle difference of opinion as to the ultimata results in case of their adoption. It is generally conceded that tha laws now in forca are deficient in several important particulars, and that tha license offered for the depredations of pot hunters practically nullifies the efforts of the various county associations in enforcing respect for closa seasons. In the discussion of tha features of the old law, the proposed amendments have been confounded with a bill presented on behalf of southern landowners, which provides that it shall not be unlawful to kill game on one's own land when game is so ahundant as to threaten either the vintage or tha crops. A unanimous opinion derogatory to the hill is entertained by prominent sportsmen in this city, and from statements mada to them hy visitiug sportsmen from the interior the hill is regarded as decidedly objectionable. It is contendad that its passage would virtually defeat the object of the game laws, and make it impossihle to reach even the most flagrant infractions, and with a view of opposing tha hill tha local organizations hava taken pains to he rapresented at the capital when its consideration will he taken up. The following interviews with local sportsmen plainly indicate the interest manifested in tha enforcement of salutary gama laws, and the different views advanced in connection with the contemplated changes:

Ramon E. Wilson, one of the directors of the Gun Club, believed that the hill presented on behalf of the farmers and land owners struck at tha very existence of the game laws, and shonld for that reason he defeated hy an overwhelming vote. When the question of amending the present game and fish laws was broached, the State Sportsmen's Association was actuated hy a desire to further the interest of sportsmen generally, and to this end, careful attention was paid to the wants of the respective game haunts. The conclusion was accepted as inevitahle, that unless some speedy remedy was afforded for the suppression of indiscriminate shooting in close and open season, game wonld ha eventually exterminated. In relation to the amendment of Section 3 of the act relating to the passing through inclosures for hunting purposes, ha said the word "inclosure" had been intentionally omitted, because it was hardly to he expected that lands partly suited for grazing, and frequented by deer, for example, should he fenced in so as to he freed from the presence of hunters. On the other hand it was incumhent npon owners who ohjected to hnnting npon their lands to post notices to that effect at intervals of fifty acres, and by this means an action for trespass would lie against those who disregarded the warning. The section might possibly he construed as helping hunting preserves, but only inferentially, and the association disclaimed any such intention. Ha helieved that deer wonld he more effectually protected hy this means, and some meaning given to the laws already in vogue. Statiatics for the past year show that 400,000 deer hides had heen tanned in this State, exclnsive of those received from the Alaska Fur Company and the Hudson Bay Company, forcing the conclusion that the slaughter of deer in California assumed immense proportions and seriously manaced their total extinction. He regarded the question of game protection hy the proposed amendments, on the broad hasis of food supply, to say nothing of the sporting feature. The ohject of shortening tha open and lengthening the close of the season was to give quails ample time to propagate and in this connection the testimony of sportsmen is that young qnail are unfit for food even on Septemher 15th. The section of the fish laws relative to the taking of fish by hook and line in tide waters was suggested for repeal hecause of tbe impossihility of proving, in cases of arrest for violation of tha law, that the fish were actually caught in the proscribed manner. The section referred to makes it unlawful to catch fish during the period when they are running up to the spawning grounds, and invariably passing from tide water to the source of the river or stream. The principle underlying tha law being to protect the fish while on their way to the spawning gronnds, why shonld not the fish be protected in tide water? Another amendment to the section prohihiting the having in possession of trapped quail except for purposes of show, was found necessary hecause of the easy excuse which it affords the parties arrested of claiming that tha quail in their possession was actually trapped for that purpose.

Mr. Ault, a prominent memher of the Coamopolitan Wing Shooting Clnh, stated that the contemplated change in tbe game laws would entirely destroy their efficacy and usefulneas, and that the present law answered the requirements much hetter than the proposed changes. The Farmers' hill, so called for hrevity, destroyed the very object sought to be accomphished hy the game laws, and its paasage wonld practically settle the qnestion, as under its protecting sanction pot hunters would rapidly exterminate every species of game. He inclined to the belief that if at any time quail should ba so ahnndant as to threaten the grapes in any locality an amendment might be made allowing owners of orchards or vineyards in such localities to trap the qnail, and which if ahipped to this city would he purchased hy local clnhs and used to stock other sections of the country. Tbe amendments were likewise objectionable hecanse they favored hunting preserves, doing much more injury than good. In his opinion, the intereats of aportsmen demanded that the present game law he retained in fnll force and effect, without modification, or at least auch as is contemplated.

Crittenden Rohinson, one of the directors of the State Sportsman's Association and a memher of the California Wing Shooting Club, atates that the amendments to the present law were formulated at the request of the State arganization in accordance with tbe auggentiona of aportsmen generally. The subject of ahortening the close aeason for quail waa deemed of the utmoet importance in view of the rapidly dacreasing quantity of available game. Another reason which had prompted the change was that young qnail did not attain snfficiant growth in the present limit of the close period to anahle them to protect or take cara of themeelves. Still another reason assigued is that, September being invariably a hot month, a large quantity of game which has either been ahot for market purposea or for private uee becomea spoiled and must necessarily be thrown away. One of the direct resnlts of extending the closa season is that it gives quail ampla time to propagate, providing at the eame time against any lack of sport. The special provision regarding tha killing of deer in Lassen, Plumae, Sierra and other mountain countiea hetween the 1st day of January and the 1at day of Auguat had been proposed for the reason that in tha lower counties deer begin to run early in November, while in the other counties they only begin to run hefora January, and moreover during the rutting seaeon the flesh is hy no means tootbsome. The further amendment which calculates upon taking the game laws out of the hands of our various Supervisors had been drafted with a view of placing the laws in tha hands of persone whose interest it would be to protect game interests.

John Stack, formerly vice-president of the Cosmopolitan Club, was opposed to any tampering with tha game laws as they stand at present. He favored a furtber shortening of tha open quail season, believing that such a courae would ha productiva of good results, as in case of a wet season qnail are not full grown wben shooting commences. He was also opposed to the proposed amendment to Section 626, making it a misdemeanor to have in one's possession a deer or a portion of a deer, the evidence of sex haviug heen removed. He believed that the amendment if adopted would cause much annoyance and would not unfrequently ba the cause of direct injury to huntsman. In support of this theory, he cited an exampla ao follows: Supposing that a party of ten had returned to camp after a successful hunt, and that one of the nnmber for some reason or other decided to leave for home. If he desired to take a portion of tha deer with him, say a portion of the breast, and had taken the precaution to skin it, and in so doing failed to preserve any of the marks which wonld distinguish the sex of the deer, under the provisions of the amendment he would he liable to arrest. He also objected strenuously to the amendment requiring the posting of notices, on the ground that it favored hunting preserves. Discriminations in hunting privileges were improper or else a clean cut should he made at once by incorporating in the statute hooks all the English game laws relativa to hunting preserves. The law should rightfully be expected to protect valuable fields from the invasions of vandals, hut such lands as were uninclosed and served merely for grazing purposes, should be excluded from the rigor of preserves.

Horace D. Dunn was in favor of so amending the fish laws as to prevent the catching of salmon tront with nets, and also making it unlawful to catch them by hook and line during the months of Decemher to March incluaive in brakish or salt water. The young of this fish are what is commonly known as trout in the majority of the coast streams. The netting of the adult fish in salt or brakish water prevents spawning, and if continued for any length of time will eventually deplete the streams. Paper Mill creek, which was formerly one of the choicest fishing grounds, was now almost destroyed for that purpose by continnal netting, which was carried on at its mouth. Rnssian river was also seriously threatened, and unless some energetic measures were taken to prevent netting it would soon he harren of fish. Tbe repeated infractions of the law relative to leaving one-third of the channel of a river open when using nets is another fruitful source of depletion. The provisions of the law are practically valneless, inasmuch as they could not he enforced by private individnals. He helieved the only way out of the difficnlty is to empower the Fish Commissioners to appoint a Fish Warden invested with full police authority to arrest persons for infractions of the law, and whose whola duty should be to see that the laws were respected, and to attend to prosecutions for violations. The Warden would find ample employment by visiting different portions of the State dnring the various seasons.

THE STAGE.

Madame Ellmenreich as "Camille."

The first appearance of Madame Ellmenreich in English, at the California Theater last Monday, was at the same time a source of disappointment as well as a presage of future success. "Camille," the drama chosen for the debut of the artiste, has been produced in this city with some of the hest exponents of the modern drama in the East, and the result must necessarily invite comparisons that might he detrimental to the future success of this talented lady in other parts far more suited to her methods, style and foreign enunciation. It is a curious anomaly in dramatic history that this play, that, with trifling exceptions, has for years been shelved in Paris, and only produced once in a very mild and goody form in England, sbould be such a favorite play for our so-called stars in the United States. Not all the brilliant art and talented casuistry of onc of the best dramatic authors of the day can divest the story on its original of its realistic and revolting elements, and it may be safely averred that nothing but the superb acting of Fechter and Madame Doche saved the piece in its first presentation in Paris, when the lights and shades of the life of a lorette were supposed to be subjects that were scarcely fit to advance the hest interests of the drama. The lady with the camelias was a well-known celebrity in Paris during the latter days of the Orleans dynasty as one of the leading courtesans of the day, who had graduated successfully from the dancing gardeus of tbe Students' haunts to the full glare of the Parisian Boulevards. Like a grub from the gutter developed at once into a butterfly of brilliant colors, the pretty, deliceate girl plunged into a series of dissipations that a robust constitution could scarcely withstand, and when once, at the full warning of her physicians, she retires to the country for a short respite, she tries in her own mind to gild the romance of a poor young man's ardent affection, and to seek the refinements of a whole-souled attachment with a heart whose affections had been cast leaflet hy leaflet for years before. The story is as old as the hills and if this *liaison* had lasted without any parental interference the denoument would been the same as in the "Marhle Heart," the lady of the camelias would have tired of her lover and have speedily relinquisbed him for the devouring pleasurcs of Parisian life. Such is the true motive of the drama, and it would be just as well to mask the admirable, full delineation of the road to ruin with soft lines and tender effects and call it Hogarth's masterpiece as to invest this soiled dove with the attributes wc most esteem in pure and devoted womanhood.

Madame Ellmenreich, like a great many of her sister artistes, either could not or would not accept this as the key note of the impersonation and consequently the whole picture was thrown into a distorted light. There was a good deal of analogy under very different views of life between "Frou Frou" and "Camille," in so far as to show how a bright, heedless, vivacious character merges into the gloom of after life through crime or misfortune, and it is in tbis apt and delicate delineation that Doche and Bernhardt so excel, as does also Adelini Patti in her best character, "La Traviata" which, by the way, in English means "The Lost One."

But if Madame Ellmenreich commences on too high a plane it is but right to acknowledge the exquisite grace and skill with which she leads to the sad denouement, the scenes with Monsieur Duval and with Armand in the last act forming gems of histrionic art, that with time and ample study of the language foretell a great future for her on the American stage. It ie idle and injurious adulation to state that her enunciation is either flowing or distinct, especially in the rapid and vehement passages. Wheu Rachael oast to the winds tha idea of yielding her elocutionary powers to the see-saw monotony of the French dramatic verse, and as "Phedre" carried the house with her, in her clearly articulated outbursts of passion or despair, her success was ga ined at the cost of lengthened and serious study and practice, so that if Madame Ellmenreich has not as yet succeeded in overcoming similar difficnlties in a foreign tongue, sha mnst in no ways feel disheartened at the resnlt. If her impersonation of "Camilla" cannot he classed as an artistic success, there are far hetter opportunities for her in "Marie Stuart" and "Adrienna Lecouvreur" and nowhere will tha future success of thie talented artiste be more favorahly received than in San Francisco.

The support was fairly good, except in tha case of J. R. Grismer, who, as Armand, made a cold and unsympathetic lover, but he was far better appreciated in the scenes that reqnire force and passion; and then, he never, for a moment, looked the part of a young French exquisite, who is as different as the English swell is from the American gildad youth in manners as in the slighter details of costume. The piece appeared to hava heen shorn of one or two of its powerful scenes, with a view, perhaps, of hringing out in stronger relief the merits of the star. This was a great mistake, and should not be repeated if Madame Ellmenreich sbould continue "Camille" in her repertoire.

The Baldwin.

With to-day's performances, the presentation of "Esmeralda" is hronght to its close, and on Monday will he produced Bronson Howard's new drama, "Young Mrs. Winthrop," that has just completed its hundredth representation at the Madison Square Theater, New York, its success heing so great that it will probably run throughout summer, although other novelties are ready to follow on its withdrawal. The story is very interesting and at times pathetic in the extreme, but the chief charm of the play is its crisp, hright, and pungent dialogue, in which point the author is nnrivaled on the American stage. Miss Carrie Tnrner will take her orginal part of Young Mrs. Winthrop, and Mr. Buckley will have an ample opportunity as the husband to show the great improvement he has made in method and treatment of difficult characters since he last trod the Baldwin hoards. The demand for seats for the first night shows that the play will be received by a critical, appreciative and fashionahle audience.

The Bush Street Theater.

These are the last nights of the Rice Snrprise Party at the Bush Street Theater, and pleasant memories will for a long time be evoked regarding "Pop" and tha excellent troupa engaged in its presentation. The engagement has heen a great success, the houses heing crowded to the last, and the company will he assured a warm greeting whenever they raturn to this city. On Monday we are promised a novelty in the way of Miss Minnie Palmer who appears with a specially-engaged company in her play of "My Sweetheart," that has been well received wherever it has heen prodnced. From the reports it would appear that the youthful star is second only to Lotta in grace, talent and vivacity, and if this should prove to be true, she will at once he received in popular favor. Mr. Hayman is a close observer of the drawing powers of entertainments offered at the Bnsh Street Theater and, backed hy Mr. Leavitt's capital and enterprise, the establishment is bound to continue on its career of prosperity.

The Tivoli.

At the Tivoli, Offenbach's opera "The Bridge of Sighs" was producad on Thursday evening and met with quite an enthusiastic reception. Of its merits as a lyric work, we shall make fnller mention in tha next issue, and for the present shall merely mention that in regard to the full cast, the handsome costumes, the fine scenic effects and the general presentation the work stands unrivaled in the annals of the Kreling management. It is said that Harry Gates and Misa Hattie Moore will soon return to the scene of their former success and that they will go East after a six months' engagement. We shall be glad to see the first statememt verified as thay are hoth great favorites in San Francisco.

Emerson's.

The programma at the Standard is ever hrimful of new songs, comic interludes and all the varieties of negro minstrelsy. These attractions, combined with moderate prices, insure a large attendance, a great many visitors dropping in, time and again, to witness soma special act of the performance. The troupe is a very strong one, and all are shown to advantage.

Dramatic Notes.

Miss Fanny Davenport is said to have given $10,000 for the American right to Sardon's new drama "Fedora," with a royalty, so that a succeesful play is now quite a honauza.

The largest royalty ever paid in a tbeater was on the occasion of the reappearance of Bernhardt at Paria after her American tour. It waa in aid of the family of a well-known scenic artist who died very poor, and tha receipts were 67,000 francs, of which 6,700 went to Alexander Dumas for his play of "Camille," thus nettiug him nearly $1,800 for one performance.

By the way, that celebrated artist has lost $75,000 in a bad commercial invastment, almost the entire fruit of her tour through Amarica, and the salesrooms of the Hotel Dronot are now thronged with ladice intent on viewing her magnificent collection of jewela and curiosities that are sbortly to he offared at public auction—a costly way of advertising her new play that haa achieved a phenomenal euccess. There are rumors of another visit to America in the fall of next year.

Tha last advertising dodge is tha case of an actresa placing her diamonds in her back hair and leaving the *chevelure* on her toilet table when sbe went to breakfast. Both the adoruments were lost hut the artist did not lose her head entirely as was the case with a Miss Dinelli at the Palais Royal recently, wbo in the midst of a quiet acene suddenly exclaimed: "Listen, how they are hissing me," and maddened with the supposition, she went in hysterics and had to be removed to a hospital for the insane. Tbe acene was very dis[illegible] the young lady was a great favorite witb the audien[illegible]

HERD AND SWINE.

Cause of Disease Among Hogs.

When hogs are fed almost exclusively on corn or corn meal, their blood becomes overloaded with carbonaceous excretory matter, at a more rapid rate than happens with cows that are supplied with less oily feed. And hogs in the great corn districts where hog cholera chiefly prevails are so fed in nearly all cases.

From huddling together in crowds, hogs, in contact with one another incidentally breathe much of the expired breath, with its containing carbonic acid, and other poison. In this way many hogs together become affected with blood poison, at the same time and in the same herd. So the blood of a whole herd of hogs may thus become loaded with an excess of excretory matter; for, though not tied up, the overfat hogs on very many leading corn farms are inactive, breathing but little during three-fourths to nine-tenths of their lives, after they are ten weeks old. From the carbonaceous quality of their food, their inactive habits, and their inhaling already poisoned air, the blood of the hogs becomes over-charged with poison, and too deficient in oxygen to form healthy growth, or to renew even the small extent of living muscle which remains from the much-reduced exercise.

There are peculiarities in the bodily condition of hogs that account for their intestines being much more affected than their lungs by the fever of hog cholera, while the lungs appear less injured than those of lung diseased cows or rather cattle. Over-fat hogs have a wall of fat extending around their bowels and surrounding the entire alimentary canal. Within this wall of fat much heat is closely imprisoned, as it were.

Huddled together in crowds hogs share their skin heat to a great extent, this position also intensifying the internal heat, particularly in the intestines, where the high degree of heat probably induces fermentation in the fecal matters. So the higher degree of heat in the intestines of over-fat hogs accounts for the lesser degree of injury in their lungs compared with cows that are affected with lung fever.

This fermentation in the fecal matter in swine affected with cholera also explains the lacerated condition and sloughing or detachment of the epithelial lining of the intestines in some cases of hog cholera.

The blood of affected hogs becoming very poisonous from the excess of excretory matter retained, the bacteria appear and begin to multiply in number. But why do bacteria multiply and grow in poisoned blood while parasites feed on sound or unpoisoned blood? The consistent answer is: Because the bacteria are scavenger organisms, whose mission and function is to organize blood poison—and to grow and multiply by organizing poisoned blood material. The parasite feeds on sound blood, the scavenger bacteria organize poisoned blood. Such is the evident difference and distinction between the two and what each feeds and grows with.—*Clark's Cattle Problems Explained.*

Keeping Butter.

EDITOR OF THE AMERICAN CULTIVATOR: In your issue of Dec. 9 occurs a communication from Z. E. Jameson upon the best method of keeping butter sweet, which in his judgment is to keep it immersed at all times in brine. My experience leads me to differ from that opinion and I prefer as my text the words of Prof. Sheldon: "Butter intelligently made, well washed, and set in a proper place will keep for many a long day." Butter will keep without being immersed in brine. The principal essentials in butter-making are neatness and temperature.

Vermont butter makers practice two methods of packing butter for keeping. One is salt, work and pack the product directly after churning, by which method the butter will shrink away from the sides of the tub, and the vacancy thus created to be filled with brine. Mr. Jameson would add more brine if necessary, and then weight the butter down to prevent it from floating in the tub. I once had a neighbor who would pack his butter as soon as he made it, cover it with brine and then put a block of wood under the cover of each tub to keep the butter from floating, but he soon changed his practice. I knew another dairyman who claimed to have made a grand discovery; he filled large cisterns with brine, and put his butter into them as he made it, and in the fall packed into tubs and sent it to market, but he practiced this method only one year. Butter that has been kept in brine, when exposed to the air very soon becomes more or less rancid. The tubs cannot be sent to market filled with brine. The buyer is obliged to turn off the brine to find the amount of tare. The commission-man will not be at the trouble of brining the butter a second time. The consumers do not wish to be at the trouble of keeping a pickle for the little packages of butter they purchase from time to time. The fancy rolls or prints that are covered with muslin or tissue paper would not be improved in appearance by being thrust into a pickle of brine before going on the table.

The second method of packing butter to keep is as follows: After churning and well working the salt into the butter with as little handling as possible, then set the butter away in a proper place for twelve or twenty-four hours. The salt becomes dissolved, the butter changes color and condition, and then a very little pressure will bring it into a dry, solid, waxy texture. Next pack the butter solid into tubs, properly prepared, putting a cloth over the top and over that spreading a paste of salt. There being but little moisture the salt on the surface does not dissolve but crystallizes, and will remain almost intact through the season. Place a close-fitting cover on to the tub and set it in a proper place for keeping, and it need not be opened until it reaches the consumer.

For nearly twenty years I made butter for one firm and have shipped hundreds of packages prepared as above without opening them at the time of shipment. Since there was little or no brine in the tubs and the packages being of a uniform size there was no difficulty in estimating the tare. Invariably I sold my butter before its shipment, weighed it and made my own estimate of the tare. Sometimes my figures were doctored a little, but not often. I confess that in my method of making and selling butter I never had much experience in keeping it on my own hands; in fact, I cannot recollect of ever keeping a tub for a full year, yet the old gentleman who purchased my butter during so many years frequently informed me that he sent packages to California, to St. Louis, and to Washington, D. C., and that it always kept well and without complaint. Rolls or prints of butter, so popular in market now, are not made for long keeping, but yet will not deteriorate much if "intelligently made, well washed and set in a proper place." E. W. B.

Moretown, Vt.

The blackleg has broken out among the cattle in Sierra valley, having worked its way down from Oregon.

The "Special-Purpose Cow."

If it would be worth while, and no doubt it is, to attempt to forecast "the cow of the future," one important element in the horoscope that should not be left out is the farmer of the future. If there is reason to believe that he will be a "general-purpose" farmer, he will require "general-purpose" animals. Only a generation ago he was such, and got directly out of his own acres almost everything that he ate, drank or wore. Each one kept a few cattle, a few sheep, and at least one horse. He slaughtered his own meats, brewed his own drinks, and his family manufactured out of the fleeces of his sheep their wearing apparel. He was a "general-purpose" farmer, and his domestic animals were moderately good for all sorts of purposes, without being particularly good for any.

The great philosophers of evolution teach us that progress is a process of differentiation. Civilization, as it advances, separates men more and more into distinct occupations, and tends necessarily to a more and more minute division of labor. The business of farming is no exception to this general rule. We can see, in looking back merely a single lifetime, how competition has been forcing our farmers gradually to devote their energies to certain chosen departments of agriculture, according as each one found his external conditions to be favorable to one kind of husbandry rather than another. Nearness of city markets has made it profitable in some places to raise vegetables for sale, or to sell milk, instead of following general farming. Large districts in New England have been found, on account of the richness of their grasses and excellence of water, to favor the making of butter. Orange County butter and Herkimer cheese have enriched the dairy sections of New York State. The same modifications of agricultural industry are now being rapidly made in several of the Western States, while the grazing of cattle for beef has been carried with great profit to remote and sparsely settled frontiers. Farmers everywhere are finding out that success is best attained by limiting their purposes; by raising a principal money crop, and making their other crops secondary and subsidiary to it; by devoting all their means and all their faculties to one or more specialties, rather than to "general-purpose" farming. Instead of being a Jack-at-all-trades, every intelligent and enterprising agriculturist is learning to confine himself mainly to a selected branch of labor, according as his conditions invite him, and then aim to turn out the best possible products of their kind, in order not to be left behind in the race of competitors. He finds that he must consent to be, not exclusively, but in the main, a "special-purpose" farmer.

Hence it is easy to foresee that in the future the farmers' animals will be, on the whole, "special-purpose" animals. The horse of the future is not to be a horse of all work. There will always be room for all the varieties we have now, and we shall continue to breed racers, trotters and draft-horses. So with cows. They will be needed for specialties, according to special conditions of locality and capabilities. We shall go on finding out more and more regions particularly adapted to making butter and cheese, as the English, for example, found out the districts in which they have kept to cheese-making for many generations. The growth of great towns will make great markets for milk and cream in their localities. Our immense plains and mountain sides will be utilized for grazing beef cattle. And to make the most money in any one of these occupations we shall want the very best cows adapted to each different one. Competition is going to be greater and greater. Only the best cows of their kind will be in the highest sense profitable. Only the best cows, kept to the work for which they are best adapted, will pay the best.

It would not be well for the country, therefore, for farmers and breeders to give over their efforts to develop the different races of thoroughbred cattle they are now so deeply interested in. To stop short in this career of cattle improvement, and unite on any supposed "general-purpose" cow that we now have, however good, would be taking a long stride backwards, and involve a great national calamity.—*J. Milton Mackie in Breeder's Gazette.*

THE JERSEY COW.—Willis P. Hazard, in his description of the Channel Islands and what he saw there, says of the Jersey cattle: "The cattle of these islands are now famous for their beauty and their merit, and are of late being widely scattered over our whole country. In the comparatively short time that they have assumed prominence there must be some great value in the breed to assert itself. The origin of the Jersey breed has been by most writers traced back to the neighboring coast of France, and more particularly to that part of it called Brittany. To this day cattle very similar in size and appearance, and which might be sold as inferior Jerseys, and have been largely sold in England, are to be seen there. Professor Gamgee wrote a special treatise on Brittany cattle, advocating their merits. But the Brittany cows are not so well developed in their udders, have not as deep barrels or, as we say, have more daylight under them, nor are their horns as fine and crumpled as the Jerseys. But this inferiority is much owing to the ignorant management by the Brittany peasants and their careless breeding."

TO SCARE DOGS FROM SHEEP.—Sheep men are growling all the time about dogs worrying their flocks and frequently killing valuable stock animals. A chime of bells—that is bells of different tones—attached to a dozen or more sheep in a flock will scare off dogs and coyotes. When the sheep start to run these bells set up a din that causes marauding curs to think a nigger side-show has broken loose, and they are inclined to make off in an opposite direction. The experiment is not a costly one, and those who have tried it say it works to a charm.

In the fall of 1880 G. S. Bingham of East Randolph, Vt., purchased a Berkshire pig. In the month of August, 1881, she had her first litter, consisting of seven pigs. Six of these pigs were kept until March, 1882, and were then sold for $115 15. In March, 1882, the same pig had a second litter, consisting of eleven pigs, four of which were sold when quite young for $11. Last fall he sold five of the remaining seven for $86, making a total of sales for the period above mentioned of $212 15. Mr. Bingham still has on hand two pigs of the second litter and a nice brood of eight pigs comprising a third litter in November last.

Lambs should be castrated as soon as strong enough to bear the operation. The weather should be favorable, at least pleasant. The better way is to have an attendant hold the lamb in his arm with the lamb's back against his breast and hold a fore foot and a hind foot in each hand. The operator should cut off say one-third to one-half of the sack with any sharp knife. The testicles will be easily pulled out with the thumb and fingers. If the lamb is a few weeks old cut the side of the testicles a little so the membranes surrounding may be released.

The Jersey Future.

In this great United States we find a great variety of climate, soil, and various conditions which affect the rearing and breeding of cattle. In addition to this we find as great variety in the demands of the people of the different countries of the earth; so that although meat producing is, and always will be, a very important branch of farming and stock raising, we find the product of the milch cow in fully as great demand as beef, but not in such great number of pounds.

As long as there is demand for choice butter, cheese, cream and milk, is there not a great inducement for breeders of dairy cows to prove their stock for the production of these articles, both in quality and quantity? There may be families of good milkers and butter-makers in nearly all of the different breeds of cattle, but when farmers are intending to improve their stock it is to their own advantage to select breeders from breeds longest and most thoroughly established for the purpose which they are intending to breed for.

Dairy farming is at present of such importance that figures are not necessary to convince readers that there is great need of improved stock; but the most important question for both the dairymen and the ordinary farmers is, what bull shall I use in order to make the most improvement in my herd and thereby increase my profits? If a farmer intends to ignore entirely the dairy qualities of his herd and depend on production of beef alone he of course would not care to have the blood of any but well-known and tried beef breeds. But I think I may safely say that the majority of owners of cows in the world wish to improve, to a certain extent at least, the dairy qualities of their cows, and the question, to what bull shall I breed my cows? is of the greatest importance to them.

Each of the leading breeds of cattle has been bred especially for some particular purpose, and as long as beef, milk, butter and cheese are demanded by the people, just so long will there be thoroughbred stock which is intended, and has been bred for its own particular uses.

But as a great many farmers do not care to raise thoroughbred stock of any kind and carry on what is called mixed farming, there will be a demand for breeding bulls of all good breeds to suit the ideas of each. A plan which is adopted by some, and should be by more, is to use bulls from the different breeds as they want a change of blood. Any careful farmer who will select bulls from the best families of Shorthorns, Jerseys or Holsteins in rotation will certainly produce a herd of cattle which will be as near what the average farmer wants as can be found. Each farmer must be his own judge, of course, as to which bull he shall use; but it is well to take the experience of others when we can get it free. A certain dairyman in Northern Indiana, who keeps 175 cows, has used Shorthorn, Holstein and Jersey bulls, and the best milkers he had were out of his native cows, and by the Jersey bull. From our own experience the Jersey has been the most successful in grading up good average cows, both for milk and butter; and when quality of beef is considered, as well as quantity, Jerseys hold their own every time. But as Jerseys are usually so much better for milk and butter, and more particularly cream, very few people have had an opportunity to test the beef of this valuable breed. After the common farmer has a chance to ascertain the quality of Jersey beef he will not sell his grade Jersey calves at a less price because the butcher tells him they are no account for beef; but he will fatten such calves for his own use and have finer beef on his table than if he buys the average beef in the market.—*Frank L. Gaston in Breeder's Gazette.*

Rules for Sheep Keepers.

1. Keep sheep dry under foot with litter. This is even more necessary than roofing them. Never let them stand in mud or water.
2. Take up lamb bucks early in the summer, and keep them until December following, when they may be turned out.
3. Count every day.
4. Begin graining with the greatest care, and use small quantities at first.
5. If a ewe loses her lamb, milk her daily for a few days, and mix a little alum with her salt.
6. Let no hogs eat with the sheep in the spring by any means.
7. Give the lambs a little mill feed in time of weaning.
8. Never frighten sheep if possible to avoid it.
9. Sow rye for weak ones in cold weather, if you can.
10. Separate all weak, thin or sick from those strong in the fall, and give them special care.
11. If any sheep is hurt, catch it at once and wash the wound, and if it is flytime, apply spirits of turpentine daily, and always wash with something healing. If a limb is broken, bind it with splinters tightly, loosening as the limb swells.
12. Keep a number of good bells on the sheep.
13. Never let sheep spoil wool with chaff or burs.
14. Cut tag-locks in early spring.
15. For scours give pulverized alum in wheat bran; prevent by taking care in changing dry for green feed.
16. If one is lame examine the foot, clean out between the hoofs, pare the hoofs if unsound, and apply tobacco with blue vitriol, boiled in a little water.
17. Shear at once any sheep commencing to shed its wool, unless the weather is too severe, and shave carefully the pelts of any that die.
18. Have at least one good work by you to refer you to.

BEEF AND WOOL IN NEVADA.—The *Silver State* gives the following statement of stock business in Humboldt county, Nevada, as shown by the books of the railroad company: In 1882 there were shipped from Winnemucca to San Francisco 13,679 fat beeves; to Oakland stock yards, 3,711; to Sacramento, 998; to Ogden, 531; to all other points, 2,056, making the total shipments of cattle for the year, 20,975. In addition to this there were 37 cars of dressed beef sent to San Francisco. These cars averaged about 38 bullocks, making about 1,200 head, which increases the total shipments of beeves from that section in 1882 to 22,175 head. In 1880 the shipments of beef cattle aggregated 21,302, and in 1881 29,382, exclusive of some 2,000 calves. Over 5,000 head of stock cattle, which were shipped East, are included in the shipments of 1881, so that the shipments of beef cattle in 1882 were up to the average. The wool shipments in 1881 aggregated 227,127 pounds, of which 155,827 pounds were shipped to San Francisco and the rest East. In 1882 the wool shipments aggregated 349,585 pounds, of which only 24,940 were shipped to San Francisco. One of the causes of the falling off in shipments to San Francisco in 1882 was the purchase of the greater part of the wool crop by E. Reinhart & Co., who shipped it direct to manufacturers in the East.

The mohair industry is a successful one in Shasta county. Fred Michael recently made a shipment of 3,000 pounds of fine grade mohair to New York.

THE STABLE.

The Perfect Foot.

When I wrote the preceding chapters of the appendix, abont two years ago, I then thought I had a fair knowledge of weight on the feet of horses. Now after that length of time of stady, observation, and the tests of many experiments. I am in donht, and in place of offering rules for the guidance of others, am forced to admit a want of confidence to make statements with any degree of authority. Further than tha I have the same lack of confidence in the opinions of others, and incline to helieve that the future must he depended upon for satisfactory elucidation. There has been a wonderful improvement in the manner of applying weights from the rude contrivances at first in vogue; there has been a great increase in the intelligence which has led to a more rational use, snd yet there is a void as annoying as it is puzzling.

That fast trotters have been made by the nse of weights ie beyond even the cavilings of the hypercritical; that many promising horses have heen ruined by the abuse of them is equally true. For a time there was a mania, an infatuation which became epidemic, and from Maine to the Pacific every track had a majority of horses encumbered with these appendages. Prohahly Indiana, for the number of trotters in training, gave them the greatest prominence. Saddle horses had heen prized there ever since the settlement of the conntry, and the popular saddle gaits were cultivated. Kentucky and others of the Sonthern States were equally as anxions to improve the horses that played so important a part in daily life, but with the exception of a portion of Tennessee, and some sections of Missonri, Kentucky was the most indefatigable in perfectiug aud breeding the trotter. The pacer and those so often confounded with the pacer, viz.: the rackers, were more readily "converted" by the nse of weights than hy any other method.

This was also the case with the broken-gaited trotters, and hence whenever a horse was of these kinds he was soon entered iuto a course in which the most poteut educator was weight on the feet.

I have stated in the previous chapters that my belief was that the mental effects were greater than the mechanical, and a few illustratious were given to snstain the argument. I still think that position is correct, and though the mechanical is the first effect, after that comes the henefit derived from the reasoning faculties heing made subservient. The animal has been compelled into action that is more favorable for speed; his intelligence then comes to his aid, and cognizant of having mastered the difficnlty, he repeats the method of handling his feet and legs when the monitor is removed.

There is another phase of the toe-weight problem that adds greatly to the tronble in arriving at a correct soln tion. While broken-gaited horses are generally amenahle to the good effects of weight, in a few instances it has heen found impossible to correct the fanlty action with weights, and then, perhaps some other contrivance may work a cure. Again there are two horses apparently identical in their gait. Weight aids one of them, the other it makes worse. Twelve onncee may he required to accomplish in one what fonr onnces may do in another, and so the paradoxes apparently come into notice at every stride in the journey, and loth though we are to acknowledge the ignorance it is so palpable that it cannot be denied.

With all this ignorance there rests the information that certain valnahle reenlts have followed the use of weights, and though I cannot go so far as my friend H. D. McKinney, of Janesville, Wisconsin, in saying that "I wonld uever try to develop a colt if I could uot avail myself of the nse of toe-weights if I needed them," I should be at a loss what to do in many instauoes if debarred from their aid. And, hy the way, I have alwaye considered that Mr. McKinney wae "better posted" on weights, the various kinds, nses and ahnses than any other person in the country. He invented some of the best patterns of their time, and was largely engaged in the mannfacture. Being a practical horseman, skillful in breeding, rearing aud driving trotters, and a man of education and intelligence, it could not be otherwise than that he must obtain an esoteric knowledge valnable as it was complete. He wrote for the New York *Sportsman* an essay which was puhlished in that paper April 30, 1881. That essay contained a good deal of sound logic, and yet I imagine that he was troubled somewhat as I am, and did not feel very positive in giving reasons why the resnlts he instanced followed the use. For instance: he credits weight with giving a tendency to "sharper folding of the knee," aud reasons that St. Julien's manner of progressiou iudicated that weight would increase his speed, and Maud S wonld do better without them, the reaeoning, of course, being from a theoretical point of view. He also states that "many horses that cut their elbows when ehod with an ordinary pound ehoe have heen prevented from doing eo by nsing an eight-ounce shoe and four-ounce weight." Now, as weight on the wall, especially if placed high, ie credited with giving sharper knee-action, in that caee the elbow should he etruck etill harder. But practice proves that this is not the case and we are all aware how euperior are the teachinge of that over the most plansibly constructed theory in the world. People, however, are hecoming convinced that much bendiug of the knee is not so esseutial as it was deemed a few years ago, and hence there is not the necessity for appliances to give that excese of motion. Then, ae in the case of the "knee-knocker" it has been found that thie exuberanee may he modified with the application of weight, and recently John A. Goldsmith informed me that he intended to apply them on tho Santa Clans-Sweetness two-year-old to "carry him out." This young trainer has heen remarkably euccessful hoth in the nse of weights and also in discarding them when the proper time came. Director is an instance of the latter, and after having been deemed one of the sort that required heavy weights to halance him, he can now trot very fast harefooted. Iu a conversatiou with O. A. Hickok a few days ago, he told me that he saw Director move around the first turn of the Bay District Course in 30½ seconds without anything on his feet, and he went with great ease and fine action.

Iu the essay alluded to Mr. McKinney gives many instances of the efficacy of toe and side-weights, and, donbtless, in the two seasons since he wrote many others have oome under his ohservation. It is not proper to take the views that were expressed even so short a time ago as two years, when the snhject is so provokingly mutatious as that under consideration. First, it was thought that masses of steel iu the shoe and correspondingly huge appendages in the weight were an ahsolute requirement. Then there have heen changes in everything pertaining, and from the crude fastener of a spike between the shoe and the foot to the latest patent there is no wider divergence than in the reasoning all have heen instrumental in workiug. I looked for a key in the instantaneons photographs of horses in motion, and as these gave the first correct knowledge of the action of a racehorse, was sauguine enough to think that with their aid the problem would no longer mystify. I pored over and studied the first cards that were published, and when Mr. Muyhridge sent me a set arranged for the zoetrope I was so eager to go at the lessone that I made an instrument which proved as good as need he to reprodnce the exact motions of life. There has scarcely been a night that I have not set the wheel revolving, intent on discovery. The gallop, trot, pace, single footing, gave plenty of chauce for comparison, and still, so far, I am in a labyrinth with one thread, perhaps, to drop in the journey. In a fast, sqnare trot there is more danger from the fore and hind feet coming together in what is called scalping than at any other gait. It may be the only gait in which this can occnr, as trotters and gallopers are the only horses in training I have had for a nnmher of years, at least twenty, and the representations are my only guide. When a colt commences to hitch it so oftentimes is the canse that there will he almost a certainty of finding that to be the trouble. Scalping-boots and speedy-cnts do not always correct the difficulty, as a touch on the leather is a reminder of the pain of previous blows. Being aware that the injury is not done in a gallop an approximation to that gait is depended npon for relief, and it takes a long time before the fear is overcome. The toe-weights give an accelerated movement, and when the hind foot passes nnder the front it is so far elevated as to give room without danger of collision. By referring to the cuts of the trotter on pages 18 and 19 it will he noticed that the two feet are very close together when the last impulse is given to eend the body through the air, and when the hind foot gives the last nervons push and is elevated a trifle, the toe of the forefoot on the same side is in close proximity to the hind foot, which is thrust partly nnder it if even they go clear.

The sharp hend in the knee, as shown on page XXI, is when the supporting legs are nearly vertical. This part of the stride is when the legs are so far apart that injnry is impossihle excepting to the elbow, and the scalping wound is given when the forefoot has just left the ground. To overcome the inertia of the toe-weight there is a quicker motion, a sort of a snatch which takes it out of the way before the hind feet come under the front. It may reqnire quite a heavy weight at first to call forth the mnscnlar energy necessary, and as the animal becomes accnstomed to this action, the weights are reduced and perhaps, finally abandoned. As has been stated, Director is an instance, and Mr. McKinney presents another, and I give it in his own words: "Last season I purchased a yonng mare at a ronud price. She was wearing pound shoes and six-onnce toe-weights. I though her fast and paid for speed when I hought her. I sent her to the track; fonr weeks did not improve her epeed. I hronght her home and took her in hand myself. First time I speeded her I saw the toe-weights were not wanted, made her fold too much and caused her to dwell, and they were dispensed with. Next day I concluded the shoes, instead of weighing a pound, shonld weigh no more thau twelve onnces. In fact, removed eleven ouncee from her feet, and in ten days I improved her epeed ten seconds. Now the man I bought her of was all right in weighting her at first, as she lacked aotion when he bought her, and the weights made her quite a trotter, but he did not kuow when to hegin to unload."

There are so many illustrations of the same kind that it would require chapters to give a small portion of them, and any person who has the least acquaintance with horsee that have worn weights ie aware of the fact Now if it were a mero mechanical effect akin to the counterbalauce on a wheel to which a crank and piston is attached the weight would be an imperative necessity at all times. If even the effect were dne to the position the weight bore to the extensors, as has been claimed, there it would have to stay. But granting that the pupil realizes that it has learned a better method of handling its limbe to progresc according to the wishes of the driver, then it is easily nnderstood why the weight can he thrown aside when the habit has beeu learned. Eveu with the larger intelligence of the human family mechanical contrivancos are resorted to to correct faults in the "style" of the athlete, the dancer aud the soldier. The proper swing, as it may be termed, cannot be mastered without using methods that compel the proper action, and these have to le persisted in until habit overcomes the dilatoriuess of natural gifts. When the jerk was first given to overcome the nnusual weight the animal discovered that the usual injury did not follow. Thonsands of times repeated, confidence was established, and by that time it became much easier to make the proper motions. With that result the weights have accomplished the purpose, and further than that, there is the drawhack of carrying the "ounce on the heel."

Iu the first chapter of this appendix I wrote that weight ie a drawback to the racehorse, an advantage to the trotter. I will have to modify that statement after the lapse of two years, and change it so as to read that weight is advantageons in the education of mauy trotters, but I am greatly in donbt of any benefit accrning after the schooling has progressed to a certain stage. Further than that I have faith that the trotter of the future will be relieved from the incumhrance of heavy masses of metal on the feet, whether in the shape of shoes or weights, though the latter may always prove one of the main resources for the correction of wroug movements. It is rather mortifying, however, to snrrender a position thought to he so well fortified that the fort could be held for any length of time, and in place of an essay replete with erudition admit an ignorance that I am well aware exists. To be candid, I mnst confess that to reconcile the conflicting testimony is heyond my capacity at present, so far as an explanatory elucidation of the reasons for well-established effects, and in lien of such a dissertation will give a description of some of the kinds that have come under my observation, the reasons I have for a preference for some of the patterns, and the difference reqnired in those that are worn with tips. This will include some novelties confined to my individual practice, and which, so far ss tested, are more satisfactory. It will, of course, he unnecessary to occupy space with those patterns which have been generally discarded and scarcely proper to select favorites further than to indorse what I consider the most correct plan of applying the weights, and the principles underlying a safe nse.—*Advance Sheets Appendix to "Tips and Toe-Weights."*

BILLIARDS.

The Vignaux Challenge—A Question of Etiquette.

Since it was announced that Mr. Vignanx, the billiard expert, would leave France for this country on or about February 1st, and that he would take part in the proposed tonrnament to he held at Chicago and New York, the American hilliard players have all annonnced their willingness, and many their anxiety, to arrange matches with him. So many challenges have been issned that a reporter of the *World* yesterday called on several of the experts to determine, if possible, jnst who was entitled to a game with Vignaux. Manrice Daly said: "Well, it is hard to keep up with the doings of the billiard world at present. All hands seem to have lost their heads, aud with them the control of their tongues, aud I fear hefore long they will he qnarreling and calling each other hard names. Vignaux' position is not a hard one to define. He is coming to this country uuder a contract, and those who are bringing him out are the persons who will dictate to him who to play and where to play. There is no snch a thing as precedence; he holds no championship that cau be played for, and is therefore in a position to play whom he chooses. The idea that Slosson has a right to a first match is all wrong. When Slosson beat Vignanx in Paris, Viguanx begged—mind, I say begged, for it is absolutely true—for a return match: but he replied: 'No, come to America and play me,' and hy this answer he forfeited his right to a new match. Besides, anyone knows that in the event of a match between the two men Vignaux and not Slosson should be the challenger, as Slosson last defeated Vignaux. Now, as to the question of precedeuce, let Slosson look at it this way: Sexton, Schaefer and I went to Paris to play Vignaux, and spent money, for which, as we did not get a game, we received no return, while every time Slosson went there he made money. The first time he made over $900, and the second time he made $1,250. The plea that he lost money is all trash. Now, you see, if Vignaux held a championship emblem that could he played for he would he compelled to play the first challenger or forfeit the trophy, but as he does not he can play whom and where he sees fit."

Slosson said to the reporter: "After I defeated Vignaux in Paris he asked for a return game, and I replied that I would play him if he came to New York. Now he is coming, I shall expect him to play me. Two others have challenged Vignaux, and I, to show that I am right in offering to play Vignaux, have challenged them, so that when I defeat them there can be no dispute as to who is entitled to play him. I kuow Vignaux well enough to know that he would rather play me than tho other challengers, inasmuch as I have already defeated him and he wants satisfaction. I made four trips to Paris before I finally succeeded in defeating him, and I think it only fair that he should come to America to play me a return matcn.

William Sexton, who was challenged hy Slosson to play a 500-point game of cushion caroms for $500 a side, was seen during the day hy the *World* reporter, and he said: "Well, I am considering Slosson's challenge, you know; he kindly gave me fifteen days to answer it, and I think he will find me ready with an answer at any time. Slosson dilates on his many journeys to France and the conntless hundreds of dollars expended in getting a match with Vignaux; but he don't tell anything of the gratuities he received on his return to this city from those who thought that he had lost money on those games. Nor does he say anything of the profits arising out of the gate-money games he played there. I never had a chance to reimhurse myself for the money I lost hy going to Paris, and have never looked for a benefit on that account. But as I am now the champion of America I feel that I have a right to challeuge Vignaux, no matter how it hurts Slosson.—*N. Y. World.*

A stir has been made in hilliard circles by the announcement that Vignaux, the French champion, will sail for this country on February 1. Slosson and Schaeffer claim [illegible] should play them before he enters the tournament. [illegible] Dionsays that he will not play in the continuous [illegible] tournament.

SACRAMENTO AGENCY.

Residents of Sacramento and vicinity, desiring to subscribe, or advertise in the *Breeder and Sportsman*, can do so through our agent, Mr. M. J. Henley, Russ House, 1009 J street.

A CARELESS CRITIC.

The New York *Spirit of the Times* puhlishes the following editorial, about California athletics, which is so full of errors as to make correction imperative:

Several months ago two amateur athletes of San Francisco were reported to have run 100 yards in less than ten seconds. We positively refused to credit such nonsense, and hy this contnmacy aronsed the ire of Californian editors, who threatened all sorts of vengeance, and finally organized a match between these alleged flyers, with the avowed dnal purpose of wiping ont all existing records, and humbling New York critics. The preliminary arrangements were eqnally elahorate and eccentric. The proprietor of the grounds promised to provide a prize valued at $100, to prepare a perfectly level 100-yard path, and to furnish five reliahle fifth-second watches; the contestants appointed one referee, one starter, two jndges, three timekeepers, and six committeemen, while the sporting jonrnals of San Francisco selected two additional timekeepers.

The race was run January 13, and won easily in 10 2-5 seconds. The varions incidents and accompaniments of the affair—the pretended misnnderstanding of the articles, the qnarrela between the contestants, the impugning of the official decision, and the ohtrusive prominence of the pool-hox—were all snch as are commonly found at professional, not at amateur races.

In the details of this fiasco we find hut one valnahle snggestion—namely, that possibly the wonderfnl times periodically wafted to ns on Californian hreezes may owe their origin to the fact that the athletic anthorities of San Francisco are evidently in total ignorance of the first principles of timing sprint-races. Any man of ordinary intelligence can time a six-day race with an eight-day clock or a ship's chronometer; but the timing of a 100-yard run, in fractions of a second, is a work requiring skill, practice, and familiar tools. Each watch has its pecnliar touch and movement, which reqnire time to master; and it is as impossible for a timekeeper to accurately time the fractions of a second in a short race, with a strange watch, as for a marksman to make a clean score of hnlls eyes with a strange rifle, or a sculler to eqnal hia fastest record in a strange boat. And yet we find that in San Francisco the contestants and the newspapers provide the timekeepers, while the track-proprietor furnishes the watches. Most certainly there is still much to he desired in the management of athletic meetings at the Golden Gate.

In the first place the recent match referred to was not organized hy California editors. It was not run especially to wipe out records and humble New York critics, hut to give Masterson a chance to retrieve his former defeat hy Haley.

Secondly, the proprietor of the grounds never entered into a contract to provide "five reliable watches," or any watches at all, and as a fact did not provide any watches. The details of the match were all left to the Olympic Clnh, from which organization all the officers came except the timers named by the sporting press of this city at the particular request of the contestants. Hiram Cook, one of the timers, used a fine watch he has had for years. Melville, another timer, used his own watch and one he has timed with for over a season. D. Eisenman also used his own watch, an old friend. The representative of this paper was not indehted to the keeper of the grounds for a timepiece. The one he used was an old friend with whose movement he was familiar and which had been specially cleaned and overhauled for use on that day. The other newspaper man also used a watch he had had for some years. The *Spirit* should be more careful of its sources of information or it will soon find that its opinions concerning California athletics carry no weight.

"THE COLD WAVE."

Our good friend H. B., of the *Turf, Field and Farm*, suggests that the mingling of snow and roses on the last day of the old year was sent as a punishment of our fervent eulogies on the California climate. We mnst admit that it is not in the best of taste to be hoasting of advantages, and showing the bright side of the cloud that is in our sky when our friends have the dreariest kind of a pall in their firmament. It is something akin to descanting in the presence of a hungry man at the grand banquet participated in just before his arrival, and now that the hurgundy and champagne have vanished, and the roasts and delicacies given place to stale beer and some scraps of crackers and cheese, with a smoked herring for a relish, he cannot be expected to hear the vivid details with any sort of equanimity. But the snow and the slush and the discomforts of the 31st of December, A. D., 1882, are not the only trihulations. There have been severe frosts subsequent to that visitation, and air which was nipping and eager. There were frozen rosebuds, yellow and scarlet roselets which would jingle when knocked together, and the pump was frozen fast, and the cow rubhing her nose on the ice of the watering trough as though she were trying to make out what sort of a freak Dame Nature had indulged in. And worse than frozen rosehuds and coatings of ice and congealed water in the pump were the anathemas and growlings, ohjurgations and faultfindings. No matter how hrightly the sun shone at noonday the drivers on the track would be muffled to their eyes, and the horses could not be "worked," all on account of the arctic weather.

Man has been defined to be a gamhling animal by an anthor who had witnessed the universal propensity to "speculate" in all quarters of the earth. Another has called him a hiped without feathers, and there have been many other changes rung on his peculiarities, notions and conceits. That he is a grumhling animal we are ready to concede, and when put on the confessional will have to admit that we too have sinned and heen ready to growl at the unusual ahstraction of caloric from our usually hland January. We are ready to do penance when we read of the hlizzards that have overwhelmed the country that was our former home, and recall the January days of the past.

A flurry of snow whitening the ground for a few hours; a terrihle coating of ice, at least a quarter of an inch in thickness; an Eastern wind that carried a rememhrance of the snow-clad Sierras, these were the grievances that elicited the animadversions and gave rise to phrases more forcihle than just. The truth is that a few years residence, in some cases a few months, make ingrates of us all, and in place of appreciating the good we are prone to magnify the little trouhles, and in striking a halance pay no attention to credits.

A few years ago there was an old acquaintance who came to California. He ventured into the whirlpool of the stock market, and sank nearly all of his means in a short time. He was gloomy, despondent, and mourned continually over the folly that tempted him to leave the "City on the Lake." It was one of the cheeriest of California winters. There had been rarely a coating of rime on the sidewalks, never frost enough to hlacken the leaves of the most tender plants. We enticed him to pay us a visit, and on one of the halmiest of days in February drove through Alameda and Oakland to show him the marvels of the winter climate. We stopped in front of one of the finest places. There was an expanse of lawn, green as an Iowa prairie in June, with heds of flowers in full hloom, and shruhbery covered with masses of hlossom. There were roses in profusion, and violets and mignonette perfuming the air. Enthusiastically we descanted on the heauties, determined to kindle a spark of feeling and drive away the hlues that had ohtained such a firm hold. It was no use. Pausing in the eulogy to give him a chance to respond, his answer came curt and forcihle: "I would not give a ——— for a country where the roses hlossom all the year round."

THE STOCKTON STAKE.

Elsewhere are printed the nominations, so far as received, in the stake for two-year-olds, to he trotted at the next fair of the San Joaquin Agricultural Association. We feel assured that it is not complete, as we have heard of others heing named, and will therefore defer remarks until fuller intelligence is received. The meager account is copied from a Stockton paper of last Monday, and we trust the secretary will send us the official announcement in time for the next issue.

We will be ohliged if he will give the pedigrees as well as the names of the colts, as this is one of the most interesting features to hreeders, and they are anxious to see what strains are thought worthy of the engagement.

OFFICERS OF THE CALIFORNIA STATE AGRICULTURAL SOCIETY.

We are decidedly pleased with the selection which the Board of Directors of the State Agricultural Society have made to fill the important offices of President and Superintendents of the Park and Pavilion.

The gentlemen chosen are more than well qnalified for the positions, as, in addition to the advantages which years of experience afford, there is zeal, enthusiastic and untiring, to make the work a lahor of love. The presidential chair will he ahly filled hy P. A. Finigan. He has an intimate knowledge of all kinds of domestic animals and is especially well versed in all matters pertaining to the horse. The stock department of a fair is invariahly the most difficult to manage satisfactorily, and when that runs smoothly the halance of the machinery will give comparatively little trouhle.

The speed department in one sense is hy far the most important. It is that which induces the largest share of the attendance and attracts thousands who would otherwise stay at home. Properly handled there can be no valid ohjeotions to the prominent position which is awarded, and only those who are higoted to a degree of intolerance can take exceptions. In all of our acquaintance there is not an individual who is better fitted to take the leading part in the stand than Mr. Finigan. We speak advisedly, having in many instances been "clerk of the course" when he occupied the position. Fearless in the discharge of the duties, prompt to discover any deviations from the rules, firm and at the same time urhane, he impresses jockeys and drivers with a full understanding of the course of conduct which will be compulsory for them to follow, and the consequence is that a straightforward path is taken from choice. It is unnecessary, however, to enter at all elaborately into the peculiar fitness of the incumbent, as we consider him capahle from every point of view. The only possihle ohjection that can be offered is that of residence, and that living at some distance he will not be ahle to give the close attention that is so essential. Fortunately Mr. Finigan's husiness will permit him to make frequent visits to Sacramento and as long a time as is necessary to give for the dispatch of husiness. With Mr. Green in charge of the Park, Mr. Coleman at the helm of the pavilion, and the efficient Secretary, Edwin F. Smith, in the office, the President has such ahle assistance on the ground that there is little risk of auything heing neglected. The superintendency of the grounds is an onerous office, as important as it is trying, and again we have to state as emphatically as we can find language to express our views that Mr. Green is the man for the place. Though unahle to attend the fair of last year, everyone we heard speak of the management was lavish in the expression of encomiums and when the trainers of horses give praise, it may safely be premised that it was well deserved. One wants the track harrowed, another insists that it is altogether too soft, while a third is just as sure that the watering cart is necessary. Then the quarters assigned are fruitful sources of contention, and whoever has this annoying duty to attend to requires a fund of patience to get through with it without an amount of trihulation that is enough to spoil the best temper. Any hesitating, vascillating man in the position would he tossed about like a hand-ball. There must be firmness or the tyrants of the tracks will not give him a moment's peace, and now that they are thoroughly impressed with the idea that Mr. Green cannot be hullied from the stand he takes and has a hetter knowledge of what his duties are than they can inform him, the trouhle is ended.

The knowledge necessary to properly arrange the multitude of articles which constitute the pavilion show only comes after a great deal of practice, and it also requires a peculiar tact which few men possess. Whoever will take the trouhle to study a premium list of the State Society will understand the magnitude of the joh, and those who attend the fair of 1883 will see how well this duty has heen done hy Mr. Coleman.

Altogether the prospects for the next exhihition are very flattering, and should there he no drawhack in the way of a "poor crop," or some unforeseen calamity, there is as hright an outlook as can he desired. While the late election has resulted so satisfactorily we would be derelict in our duty were we to fail in awarding Mr. La Rue the credit he has so thoroughly earned. He has done the Society, the State and himself honor hy his ahle management. His services in the directory will be of the greatest value, and whenever extra work is required it is sure that he will not shirk the task. The same can be said of the other members of the Board and altogether there is an active, working force of immense benefit to the people of California.

THE HORSE BREEDER'S GUIDE AND HAND BOOK.

The above is a title of a neat volume of 205 pages octavo. The following is a circular letter from the author, and we can heartily indorse the views expressed. Col. Bruce has such an intimate knowledge of the genealogy of racehorses and trotters that he is peculiarly well adapted for the task he has brought to such a successful termination:

New York, Jan. 15, 1883.

Dear Sir: To supply a long-felt want by breeders and turf patrons in America, where the science of intelligent production of the race-horse is, comparatively speaking, in its infancy, the author of the above entitled work has condensed the results of his association with the most prominent breeders, and years of study of the pedigrees of the most famous horses the world has produced, and endeavored to shape his ideas in such form as will inure to the benefit of the turf, trotting as well as running. The labor of a lifetime devoted to the study of the thoroughbred horse, and the conclusions arrived at after a full digestion of the subject, will warrant the author in stating that the views embodied in the "Guide and Hand Book" are fully established by the experience of ages, and are sifted from the immense amount of rubbish incident to a want of judgment in making the proper crosses. In the work above mentioned, the tabulated pedigrees of the most prominent sires of this country, of the present age and of years past, are given fully, showing in each instance all the crosses which have produced the best race-horses. In addition, there is an introductory treatise on the subject of breeding, giving an exhaustive review of the racing families of England and America, and pointing out with great perspicuity the causes of the happy results so well known to all turf men. As a book of reference for all interested in the thoroughbred horse, turf men as well as breeders, the author has endeavored to make the work complete, and with due deference to the opinions of others, hopes he has succeeded in his efforts. The book contains over 6,000 pedigrees in the collateral branches. Price $2 50, postpaid. Most respectfully,

S. D. Bruce,
Author of the American Stud Book.

The plan followed is the most comprehensive system of recording pedigrees, and enables the student of breeding to understand the lives and descent with a small portion of the labor that would be otherwise required. In fact it is almost impossible to obtain full knowledge in any other way, and whenever one desires to learn the full particulars of the genealogy of an animal the pedigree is tabulated, if that labor has not been performed by some one else. There is no turning over leaves, searching through several volumes, or strain on the memory to carry the information until the desired link is found. Here it is on one page, and the ancestry of one hundred notables spread before the inquirer in a plain chart. In these one hundred tables are many thousands of names, practically answering the purpose of a stud book, American and English, to those who have kindred strains.

In addition to the pedigrees there are descriptions, in most instances giving size, color, shape, performances and the most notable of their sons and daughters.

Every part of the work has been edited with the utmost care, and it is safe to say that the pedigrees and records can be relied upon.

The mail brought the book Monday, and we carried it home in order to study it more leisurely than the duties of the office would permit. We became so interested in it, however, that it was difficult to lay it aside in order to accomplish the work we compass in these long evenings, and we could only make amends by curtailing the hours of refreshment and repose. That a work of this class should be absolutely free from errors is not to be expected, though so far as we can determine it is wonderfully clear from mistakes of any kind. About all we have been able to discover is in the short sketch of Bonnie Scotland. He was not sold by A. E. Smith to the Messrs. Parks, but was hypothecated with all his other horses to Mr. Stevens of Cincinnati, of whom we purchased him in 1868. That winter we sold a half interest to D. A. Gage, and the season of 1869 he made at Riverside, Ill. That fall we sold our interest to Messrs. Parks, who afterwards became sole owners. In addition to Malcolm, Dangerous and Ontario there was bred in Ohio Surprise, Scotland, Regent, Lady Fairfield, Columbine, Wananita, Liverpool, W. H. Johnson, Nelly Gwinne, Lobelia, and several other winners. Nathan Oaks and Experience Oaks were bred in Kentucky, and purchased by Messrs. Parks when one and two years old. Papermaker and Joe Howell were bred at Glen Flora. M. S. Patrick sent Magenta to Ohio, and Blinkiron was the result, one of the best racehorses we ever owned.

At the price this book is marked it should meet with an extensive sale, and it may in a measure remunerate Colonel Bruce for the labor he has given the "American Stud Book." That this should prove correct we sincerely hope.

AUCTION SALE OF TROTTING STOCK.

On the 28th inst. there will be offered at "public outcry" by Killip & Co. at the Oakland Trotting Park a very valuable lot of trotting-bred stock, belonging to the estate of the late Daniel Cook. There are 107 lots in the sale catalogue. Thirty-six brood mares, six trotting geldings, twelve which are classed as trotting stallions, being colts of 1881 and 1882, thirteen trotting mares and fillies and twenty-six classed as roadsters. There are four saddle horses, several work horses and mules and a lot of miscellaneous articles which are always such a prime necessity in a stable where trotters are trained.

It is certainly very rare when the opportunity is offered to obtain such a number of highly bred trotting stock at an auction sale. There are many of them as fashionably bred as can be found in any country.

First on the list of brood mares we place Nourmahal, but this favoritism may arise from having owned her, and being impressed with too high an opinion of her merits. There is not an untried mare that we would rather risk, and if the owner of her colts we would not hesitate to engage them in any company. There is an error in the catalogue in giving her age, as she was foaled in 1863. Her sire died the fall of 1862, and she is one of his youngest colts. Lady Slasher should be a grand brood mare, not only highly bred, as we have seen her trot fast. Then there is a mare by Nutwood from a dam by the sire of Abe Edington, and Carrie Clay by Coaster from Calypso by Mambrino Chief, and mares by John Nelson, Speculation, imported Mango, Whipple's Hambletonian, Niagara, Woodford Mambrino, Electioneer, Rifleman, Norwood, Signal, Swigert, Thorndale, Elmo, Norfolk, Echo, Belmont, the dam of Gibraltar, a daughter of Minnehaha, etc. Here is a chance for a purchaser to select his favorite strains, and so far as the blood goes he can scarcely go amiss. When the breeding is right the form is apt to be superior, and judging from those we have seen due attention has been paid to secure this desirable combination. A majority of the youngsters offered are by Steinway and it will certainly be an anomaly if this stallion does not prove a capital producer of fast trotters. Speed he has in his own right, as an inheritance from his sire, and as a member of the tribe that stands at the head of the list.

There should be several years' trotting in Graves, as his age is that when trotters usually display their best powers, or, as in very many instances, when several years older than Graves. He is a very pleasant horse to drive, and single or double of the right type for the road.

There is scarcely a question that this stock will sell at prices which will be greatly in favor of the buyers. So many are offered, and with such a uniformity of desirable qualities, that there will be a chance for all.

For catalogues address Killip & Co., San Francisco.

REPLY TO COLUMBUS.

We cheerfully give room to the answer of H. T. White to the charges which our correspondent made in a late number of this paper. It is evident that a strict construction of the language used by Columbus justified Mr. White in repelling the charge in strong terms although the intention may have been different, and the meaning to be conveyed not that which would imply prompting on the part of the biographer.

That some drivers are prone to accuse themselves of rascality we are well aware, and in a great many instances the Eastern papers have contained communications of that kind. The case of Saunders was not the first one we have called attention to, and years ago we suggested the propriety of a rule that would put a stop to the practice. Such a law is imperatively demanded, and before the meeting of the National Trotting Association next February we will do our utmost to have it placed in the code.

Mr. White has succeeded admirably in putting these sketches of Western drivers in an attractive shape and it is a pity that they should be marred by episodes of the sort interpolated by Saunders.

But as Fielding justified writing the life of Jonathan Wild to show the hideousness of a career of vice, it may be that giving the wrongdoings of a driver the publicity of a widely circulated journal, the grievance will be corrected.

We feel assured that the strictures of Columbus were unwarranted so far as Mr. White being an accessory to originating the statement about the driving of Newburn is concerned, and that Saunders is entitled to the odium that rests on the degrading public confession, and, from the air of bravado accompanying confession, without repentance.

GOODWIN'S TURF GUIDE.

There is no question that the work of compiling the turf statistics for 1882 has been faithfully done by the compilers of the volume which bears the above title. It is complete and skillfully arranged, and is well worthy of support. Still we must admit that we are sorry that any other work should come in the way of H. G. Crickmore securing the reward his arduous labor for so many years has given him the right to enjoy, and it may be that competition may stimulate those who are interested in the sports of the turf to remunerate all parties engaged in the business. This has been the case with the multiplication of the journals that make the sports of the turf and track one of the main features, and readers increase in greater proportion than the papers. Thirty years ago there was only one paper of the class in the United States, and the "leading dailies" paid little or no attention to the topic. At the present day there are so many that we are unable to tell the number, and every daily paper in the larger cities that makes any pretensions to a front position has a "turf editor" in its regular corps. Now it may be that the duplication of the Guides will have the same effect, and both parties secure patronage to which they are so clearly entitled. Both works are well worthy of support, and it seems incredible that so many patrons of the turf should be without them. That of Messrs. Goodwin is very neatly gotten up, and is offered at the extremely low price of $1.50.

EDITORIAL NOTES.

It is not necessary to add much to the synopsis of the able report of the secretary of the California State Agricultural Society, as he has presented the statement so clearly that it cannot be misunderstood, yet there will be texts that will be used hereafter, as the copy came too late for proper comments this week. In the meantime we call attention to the report which will be found in another column.

Gov. Stoneman has appointed A. B. Dibble of Grass Valley and R. W. Buckingham of Benicia to be Fish Commissioners, vice W. W. Traylor, deceased, and J. D. Redding, not confirmed by the Senate. Both these appointments have been confirmed. The third member of the Board is S. R. Throckmorton of Marin.

Answers to Correspondents.

Questions answered only through these columns. No replies by mail or telegraph.

C. A. C., Ranchito:

Alexander is not dead but alive, well and vigorous. He made the season of 1879 in San Luis Obispo at $50.

Interested, Chico:

The Ralston mare is by Easton's David Hill, her dam, Dolly McNeil, by Hoagland's Grey Messenger.

Reply of H. T. White to Columbus' Strictures

I notice in a recent issue of your paper a communication from the pen of some person in Tiskilwa, Ill., signing himself Columbus, in which my name is frequently mentioned, and my fairness as a writer impugned.

Not being, to my knowledge, personally acquainted with the person who seeks refuge behind a nom de plume before venturing to attack by name one with whom he sees fit to differ, and never having had much respect anyway for the wait-till-you-are-going-past-our-barn-some-day-when-I-am-hidden-in-the-hay-mow-with-a-big-rock style of adversaries, I shall dismiss Columbus from this letter at once.

What I desire to say to the readers of your paper is that any statement that the articles which recently appeared in the *Breeder's Gazette* of this city, relative to the experiences of Messrs. George Saunders and Peter V. Johnson with the various trotters they have driven, "emanated largely from the brain of Mr. White" is wholly and unqualifiedly false. The gentlemen under whose names those articles appeared in the *Breeder's Gazette* furnished of their own free will and accord every fact that is therein stated, and not in one solitary instance was there a statement of fact made in those articles that did not come direct from Mr. Johnson or Mr. Saunders. I say this without any reservation whatever, and in the full belief that no attempt to contradict it will be made by either of the gentlemen who are most directly interested in the matter.

H. T. White.

Chicago, Jan. 30, 1882.

Foals.

At J. B. Chase's farm, Sonoma county:

Folly, by Planet—Miranda; dropped a chestnut colt, February 1st; star in forehead, one hind foot white half way up to hock; by Wheatley.

Rebecca, by Hubbard—Electra, by imported Eclipse, dropped a bay filly foal February 4th; strip on face, right hind foot white half way up to hock; by Wheatley.

Mr. Robert Liddle was at Duncan's Mills on Russian river last week and brought home two fine salmon trout one of which weighed ten pounds and the other ten pounds and four ounces. Mr. L. hooked four of these fish but two broke the line and escaped. Another gentleman hooked on eight but all got away. We hear that thousands of salmon are being taken by Italian fishermen with their seines.

At a meeting of the Golden Gate Boat Club held last Sunday the following officers were elected for the ensuing term: President, John F. Waltham; vice-president, John F. Flynn; secretary, James Finn; treasurer, John D. Griffin; captain, James Clark; vice-captain, Dennis Griffin.

The San Francisco Yacht Club has been canvassing the prospects of the coming season. Measures are being taken to liven matters up a little more this year. If all the differences among the members are settled, affairs will run more smoothly.

Only one of the present Fish Commissioners is a resident of San Francisco, and that one is incapacitated by ill health from any longer taking any interest in fish or game.

Albert Pell, a noted Englishman, says after extensive study that England has little to fear from the importation of American beef cattle. As this country settles up, prices will be so high that they cannot be shipped at a profit.

Random Sketches.

No. 4. "Henry the Ham."

[Written for the BREEDER AND SPORTSMAN.]

Among the many amusing incidents of my sporting memories, none recur so often as the pedestrian mania which struck San Francisco about '63, when Jimmy Kenovan gave the five mile belt, and all the boys were runners, and the whole community were on the lookout for fun in that line. Each fire company had its fast runner, and would back him too, for any reasonable amount.

Knickerbocker No. 5 on Sacramento street could put a couple into any race. One would hardly credit it, to look at him now, but Jim Riley, our present assistant engineer, could get out and run his five miles close on to thirty minutes, Hen Derrick, also of No. 5, could pull a sulky with a man in it, and beat a good mile runner at that. Monumental No. 6, on Brenham Place, had Jim Dyer, on whom the boys would invest all their loose change in the event of a foot race. And young Charley Dexter, strange as it may now appear, could, and did, in those days, run at the head of the hose carriage rope, and carried the fox tail many a day.

Johnny McGreavy, now on the police force, represented No. 10 Engine, and was the champion five miler for a number of years. Barney Cosgrove was his competitor, and ran with No. 4 Engine.

Every engine company had a fleet-footed representative, and many a race took place, upon which large amounts of money changed hands, and in which the community were much interested.

Every man in each company of the fire department was keenly alive to the importance of securing the best talent and so every new comer to town, who seemed at all fleet of foot, was taken in hand by the boys.

Knickerbocker Engine Company always were more enthusiastic to obtain the best. A fleet runner found by Five's "fellers," had everything offered him to run under Five's badge. And money for expenses was freely furnished.

When the Mechanic's Fair closed, leaving the pavilion standing on the square bounded by Stockton, Powell, Post and Geary, a circus company rented the building and fitted up a track, upon which hurdle races, etc., were run and when the circus company closed business, the different hose companies ran many races on it. All the pedestrians of the day had the privilege of using the track to train, and each day all the noted "peds" could be found there taking their regular exercise.

The tendency to practical joking was great, and one can readily tell an "old timer" nowadays by the alacrity he shows in "catching on" to a practical joke.

The "Ham Guard" was a regularly organized society, and Alex. McKenzie, Chris. Tracy "Cockney," Ed Cleveland, Joe Stevens, Bill Ladd, Ned Stewart, Phil McGovern, Old Bill Clark, Senator McCarthy, Jim Molloy and several more kept up the reputation of the "guard" by many a good turn.

The pedestrain mania afforded them good opportunities for encouraging the objects of the "guard."

About the time that the racing was at its height among the firemen, there came to the city a most extraordinary man who was first noticed in company with Five's fellers. He was six feet and one inch in height, weighing about 180 pounds, had a wild eye, and very high cheek bones. He could run like a deer, as the boys soon found out, to their cost. Many matches were made, and every match was won by Five's man.

Riley had him in great fix and condition, for besides the run every night with the engine he was put though a regular course of exercise. He of course "bunked" in Five's house and every morning was walked to Fort Point, and run back, and when he returned to the house and stripped it was "great joy" to stand him in the yard and turn on a full head from the hydrant through fifty feet of hose and the blunderbuss, and wash him off. The stream would knock him down often, but he demostrated his pluck by jumping up and facing it again. With pleuty of good food, which the boys furnished freely, and all this exercise, Henry—for so he announced himself—became the picture of health and condition. He was like iron, but in the course of association it was developed that Henry was a "little off," what nowadays we should call a "crank." To the boys he now became known as "Big Henry, the Ham." His "crankiness" was physical exercise and athletics. He walked, he rowed, he ran, and it was only necessary to assert that Henry could not do either of the above athletic feats to gain his consent to try it. But he would not attempt any of his feats unless he was assured by some of Five's fellers that there was money upon the result.

So when the boys wanted some fun with Henry they had to get up an argument, and then put up a bogus bet, when Henry would tackle the proposition with a vim entirely his own. At the launching of the ironclad at the foot of Third street, sent out here in pieces in a ship, a controversy arose as to Henry's rowing abilities and a bet was made that Henry could not row from the foot of Third street, around Mission Rock, and back in twenty minutes. Henry agreed to row, and a plate of boiler iron four feet long by two feet wide having been fastened to the keel of the boat—of course unknown to Henry—he was given the word, Go! It only serves to give one an idea of his immense strength and stupidity to state that he rowed the boat around the course and never knew what made him so slow. It took him one hour and a quarter to accomplish the feat.

But his "hobby" really was running, and when Riley informed him that there were no other men to run him a race, that he was the champion, Henry was too delighted. Shortly afterward, when it was proposed to match Henry to run a race against Jack McGuire's greyhound, Henry fell in very readily. One thousand dollars a side was announced as the stake, and Henry went each evening to see the different installments put up, never dreaming that it was the same money which did duty at each installment. The news went around the town speedily—no need of posters or newspaper notices. The Pavilion was engaged, and on the night of the race was crowded by representatives from every part of this, then, fun-loving city. As many as 3,000 people were present. A hose-cart race between Monumental No. 6 Hose Company and No. 4 Hose came off first, and then the race of the evening, "Henry versus the greyhound." Oscar Lewis was appointed referee. The dog was brought on the track in heavy clothing and an attendant walked him around the track, preliminary to the start. Henry shortly came on the track, accompanied by his mentor, Riley, and attendants with buckets of water, lemons, etc.

It was a study to see Henry's examination of his opponent, the greyhound. But whatever doubt he might have had in his mind as to his ability to cope with a four-legged antagonist was dispelled by the stentorian offer of Riley to bet $500 that Henry would win the race. The final arrangements were now made, and the competitors were called to the referee's stand—Henry in his running gear, looking a perfect model, and the dog, looking as apathetic as greyhounds generally do. The referee announced the terms and conditions of the race to Henry and the backers of the dog, the race to be a race of five miles around the ring, it requiring thirteen times around to make one mile—therefore the whole race would be sixty-five times around the ring. Henry was cautioned not to touch or tread on the dog, under penalty of losing the race and money. Here Phil McGovern cried out that he would wager $1,000 that the man won the race, and Henry's grateful eyes sought out the speaker, and with a nod of his head, said that he'd be d——— if he wouldn't.

The track being cleaned the word was given, and away went Henry like a flash, the dog simply following him around and enjoying it amazingly. By this time the whole crowd had become aware of the "ham" and such a scene of confusion as ensued is seldom witnessed at any kind of a race.

"Go it Henry!"

"Hurrah for the dog!"

"A thousand the dog wins!"

"Ten thousand Henry wins!" All this time Henry was running like mad.

At the two-mile mark Bob Tucker handed Henry a sponge filled with strong vinegar to wash his mouth with. This set him to choking and the dog, called by his master, ran ahead. But as soon as Henry recovered from his effects of the vinegar he redoubled his efforts, and soon the dog finding that he again had company fell to the rear.

As Henry came round now, each time he passed the referee's stand, an attendant met him and threw a bucket of water full in his face. Henry would shake his head and go on as strong as ever. Then Senator McCarty gave him a handkerchief to wipe his face with which was filled with burnt cork, and his appearance after using it was most indecive to renewed laughter and cheers and more bets that Henry would win.

About three miles out, Henry being ahead, of course, the attendants caught the dog and took him out of the ring. Then they yelled out at Henry to "go it," and go it he did. The crowd closed in behind, and Henry, urged beyond his speed, tripped in the soft track and fell. Then the yelling redoubled and the evident fear of being lynched for losing the race induced Henry to allow himself to be led into the dressing room where he was rubbed down with gunny sacks until he bled.

The shame of losing the race, the mortification of losing hundreds of dollars for his friends, must have affected Henry, for after the night of the race, he went away as mysteriously as he came, and the places that knew him so well have known him no more since.

Swimming Club.

A London correspondent of the New York *Spirit of the Times* presents an idea that is well worth the careful digestion of our American amateurs whose predilections are aquatic:

So far as your own journal—with all the information it supplies—is concerned, I do not find that amount of pleasant reading which I should like to have in regard to swimming. I am interested in, and curious with respect to, feats of natation. Certainly you give an account of performances in England. That is all very well. You only have to follow and chronicle events. Why not go further, and originate them? With the great associations you have in America there should be little trouble. I should be delighted to find that every association in America connected with rowing, of course had its own swimming club—not like local affairs, but on the principle of my own club, the London Ilex. Let me give you an account of this club. What I am going to say may not be generally known.

Twenty-three years ago a magnificent idea, so far as we on the London river are concerned, entered into the head of the late Mr. Harvey, a member of the Ilex Rowing Club. It was to start a swimming club, which should only be open to members of gentlemen-amateur rowing clubs, and the governing body was chosen pretty evenly from the various societies belonging to the new club. That such a club as the Ilex was greatly wanted can easily be understood, when it is taken into consideration that many men who row light boats, and are constantly in danger of an upset, cannot swim. The club undertook to teach its members free of charge (I well recollect, I was one of the first); there was no entrance fee, and only a nominal subscription of five shillings, or a guinea for life. Races took place in public baths, afterwards in the River Thames, and, in fact, in many different localities; but these were for a long time confined to the clubs in the amalgamation.

The new idea took largely, and the club became a great success. While benefiting those who were entitled to belong to it in a swimming capacity, it also did wonders for the social position of the river. Men of different clubs, who formerly used to "bite their thumbs" at each other, fraternized in a most cordial manner, and the acerbity of temper, which otherwise would have shown itself frequently at regattas, was molified, from the fact that the men had become, to a great extent, friendly, the one with the other. In after years the club got on a great deal better. Races were originated, a great annual swimming entertainment took place, where all the various rowing clubs mixed together in a friendly manner, and the club has proved to be the most admirable conception that could have been devised to bring about a homogeneity of London amateur oarsmen.

CONDITION OF A BREEDING STALLION—The stallion requires regular exercise for weeks before he stands for mares, says the *National Live Stock Journal*. The soft, relaxed muscles, from indolence or improper exercise, and the obstruction of the organs of locomotion, from over-loaded flesh, are unfit to be entailed, and will produce nothing of any value. The art of conditioning the stallion for the stud consists in suitable exercise, to harden the muscles, sweating out the surplus fat to clear the wind, rubbing down the pores of the skin, so that the insensible perspiration will improve the health, and cleansing out the whole system, so as to prepare for the free circulation of the blood that stimulates the organs of locomotion. The stallion is generally pampered in idleness, which destroys his ambition; overloaded with flesh, which obstructs his action; and overtasked in the stud, which causes him to get lank, leggy, ill-formed, worthless colts. To avoid these degenerating effects, the sire must be trained up to the highest state of constitutional vigor, so as to generate the same health and vigor in his offspring. It is a truism in animal physiology, that the most active organs will reproduce their own activity. It is the great muscular activity of the sire, and nervous energy of the dam, that stamps the impress of speed and bottom upon their colts.

Miller & Lux ship an average of fifteen car loads of cattle per week from Merced.

A mile race track is being built at Shasta.

The Home of the Horse.

There is no doubt that the original home of the horse is not Europe, but Central Asia; for since the horse in its natural state depends upon grass for its nourishment and fleetness for its weapon, it could not in the beginning have thriven and multiplied in the thick forest-grown territory of Europe. Much rather should its place of propagation be sought in those steppes where it still roams in a wild state. Here, too, arose the first nations of riders of which we have historic knowledge, the Mongolians and the Turks, whose existence even at this day is as it were combined with that of the horse. From these regions the horse spread in all directions, especially into the steppes of Southern and Southeastern Russia and into Thrace, until it finally found entrance into the other parts of Europe, but not until after the immigration of the people. This assumption is strongly favored by the fact that the farther a district of Europe is from those Asiatic Steppes, i. e. from the orignal home of the horse, the later does the tamed horse seem to have made its historic appearance in it. The supposition is further confirmed by the fact that horse raising by almost every tribe appears as an art derived from neighboring tribes in the East or Northeast. Even in Homer the ox appears exclusively as the draft animal in land operations at home and in the field, while the horse was used for purposes of war only. Its employment in military operations was determined by swiftness alone. That the value of the horse must originally have depended upon the fleetness, can easily be inferred from the name which is repeated in all branches of the Indo-European language, and signifies nearly "hastening," "quick." The same fact is exemplified by the description of the oldest poets, who, next to its courage, speak most of its swiftness.—*Popular Science Monthly.*

Three Hundred Lost Dogs.

A few weeks ago, while X. Beidler was at Junction, which is on the Northern Pacific road, about a mile and a half west of the Big Horn tunnel, a lot of X.'s people, the Crow Indians, took it into their heads that they would like to have a railroad excursion to visit some of their relatives down near Mandau. So X. and two or three other near friends of the Crows went to work and by liberal use of the telegraph soon effected arrangements for railroad transportation of the Indians, and two box cars were put at their disposal. Into these cars about thirty families were crowded, and the excursion moved off. Each family had an average of ten dogs, and as no means were provided for the transportation of the canines, those faithful servants of the Crow tribe (about three hundred of them) were compelled to walk. They managed to keep up with the procession until Big Horn tunnel was reached, and when the "fire wagon" darted into the tunnel, the canines struck over the hill with the purpose of heading the train off on the other side. When they reached the opposite end of the tunnel, however, the Indian excursion had already passed and gone out of sight like an odoriferous dream. But the dogs, supposing their masters were still in the big hole, remained there for several days, patiently peering into the tunnel opening. A week or so after the Crows came back, but found their dogs had disappeared. Some had died of too much lead in their blood; some had passed broken-hearted down the ringing grooves of change, and others had kerflummuxed on general principles. The Indians had stayed away until the last dog had died—or nearly so.—*Helena (Montana) Independent.*

GLANDERS IN SAN JOAQUIN COUNTY.—A Stockton horse doctor reports that that most dreaded disease, glanders, is prevalent in various parts of this county, and that several animals have been killed which, it is averred, were afflicted with this disease. According to the current reports, it has appeared near Atlanta, in the vicinity of Waterloo and on the lower Sacramento road. Mr. J. W. Gibbs, whose farm is a few miles west of Lodi, had a sick mule which he doctored for a month and then killed, having been advised to do so by parties who professed to see symptoms of glanders in the animal. Mr. Gibbs became so much alarmed that he buried his stable and its contents over the carcass of the mule. Another veterinary surgeon, hailing from San Jose, has arrived in Stockton and pronounces that there is not a case of glanders in the State. It is very easy to imagine the symptoms of the glanders in a horse when it is only afflicted by a bad cold. Col. L. O. Gillispie informs us that some weeks ago he saw a mule on Mr. Barnhardt's place, which he was told had the glanders. All that ailed the animal, however, was that it had been exposed during the early rains after being overheated by dragging a scraper in the tules. While not placing much confidence in this alarming report, we would advise the utmost vigilance among farmers to prevent even the possibility of this dreadful and incurable disease breaking out among their stock.—*Lodi Sentinel.*

BIG DEAL IN BEEF.—A cattle transfer has recently been made in the territory of Wyoming which is a little ahead of anything previously done in that line. The herds of three great firms, aggregating 87,000 head of cattle, and with the ranches, buildings and grazing privileges, have been sold to a syndicate of Scotch capitalists, the consideration being $2,550,000, to be paid within sixty days. The papers were all signed on the 11th day of November, and have been taken to Scotland by the agent of the syndicate. Mr. A. Swan, who was the leading member of each of the three firms, still retains an interest in the new firm, and will have the general management of the stock.

JOCKO.—The bay colt Jocko, four years old, by Caribou—Reply, bred in Montana, has been named in the Autumn Cup and the Great Long Island Stakes, to be run at Couey Island this fall. Jocko was here at the last meeting of the Blood Horse Association, but did not start in the four-mile event as expected.

Our enterprising contemporary the BREEDER AND SPORTSMAN, published in San Francisco, Cal., presents its readers, in the New Years number, with a splendid oil lithograph in colors, of the four-year-old stallion Albert W, by Electioneer. Albert W, as his picture represents, is a fine bay stallion with black points, possessing both size and substance.—*Maine Horse Breeder's Monthly.*

The Fresno Fair Ground Association have changed the location of their grounds from the tract that it was at first proposed to purchase for that purpose and have bought a quarter section from Thos. E. Hughes & Sons immediately adjoining that tract on the south.

A few days ago Nels. Hammond drove his bay horse Dave 80 miles between 4:30 in the morning and 6 o'clock at night. He went from Reno to Al. Evan's ranch in Long Valley, and back.—*Reno Gazette.*

FISH.

"No Rest for the Wicked" Fish.

The disregard that some people have for laws and the unsurpassed coolness with which tbey break the same has again been brought to our notice. Notwithstanding the many suits, and some convictions that should be a warning, the game and fish laws are still openly defied. Time and time again we have spoken of instances where deer and other game have been destroyed out of season, but this time we would call attention to an outrageous distruction of salmon trout at no great distance from this city. Fishing in fresh water has been prohibited by our Legislature after tbe first day of November and to do so before the first of April is a misdemeanor.

We understand from good authority that salmon trout have been and are being caught in the fresh water of the Lagunitas creek and its tributaries. Several gentlemen were over in Marin county last Saturday and Sunday and state that they saw three or four persons fishing above the dam of Taylor's paper mill, and the fishers did not attempt to conceal what they were doing. As we hear, it is only a few of the bolder ones that fish in the day time but after dark angling is carried on with impunity.

Another case can be meutioned in which the avenging sword of Justice is looked upon with the greatest indifference. A few weeks ago Taylor was convicted for not having a fish ladder or runway that fish might reach the waters above his dam at the paper mills. The suit was brought by the Fish Commissioners and after the conviction Taylor was ordered by the court to have a fish ladder placed over the obstruction immediately, that trout coming in could ascend the stream to spawn. Though this order from the court was issued several weeks ago there is not even the sign of a runway there yet and innumerable beautiful salmon trout, heavy-laden with spawn, are in the stream and slough below the dam trying to proceed up the water-course, but which are, of course, prevented by Taylor's obstruction. Nor is this all: A great many persons, mostly Italians, though several Americans, are aware of this state of affairs and they, with pitchforks and garden rakes, clubs and poles, are killing and no doubt selling hundreds of these beautiful fish, many of which measure from ten to upwards of twenty inches. All the fish that escape the pitchfork and rake fall victims of a sure destroyer—the Italian fishermau's night seines and nets. On several occasions fishermen have been seen after dark manipulating their seines and the number of salmon trout taken in these waters and by these means lately is simply incalculable. The Italians have also made a combined attack with pitchforks and rakes on all fish that try to ascend the stream at Point Pedro and from what we hear they have succeeded pretty well in conquering the enemy. No doubt there are a great many more beside those above spoken of who are robbing our streams on the sly and it is time that the Fish Commissioner and the State Sportsman's Association were taking the matter in hand. Is it that the commissioners and sportsmen are ignorant of the state of affairs? Or are they aware of wbat is going on but unable to catch the lawbreakers? If the latter is the case it would do them no harm to turn their watchful eyes to the places that we have mentioned and they might be rewarded by capturing a fish catcher some of these days—or ratber nights.

Salmon Canneries.—Black's salmon cannery at Martinez is rapidly being put in order, according to the *Gazette*, for the spring work. Twenty or more Chinaman were put to work this week preparing cans. The salmou run will commence abont the middle of March, bnt few fish will be caught until a month later. The cannery on the wharf, formerly owned by Kendall & Shields, has changed hands, and will be run this season nnder the management of Mr. Weatherbee, one of the principal owners. It is to be hoped that the proper officials in this and adjoiming counties will this year pay some attention to the open and wanton violatiou of the laws by many of the fishermen in catching salmon out of season. Last year hundreds of thousands of salmon were destroyed through the criminality of the fishermen.

A total of 654,677 pounds of salmon was the work of the two canneries at Humboldt bay during the year 1882.

THE RIFLE.

A Fifty-Shot Match.

Last Saturday on the 12:30 ferry boat there were three aspirants for fame as marksmen, Col. Beaver, Mr. H. Carr and P. D. Linville. The match was twenty-five each with pistol and rifle. On arriving at Shell Mound the sharpshooters proceeded at once to the range and in so doing they had to pass through Capt. Siebe's saloon. The Captain's barkeeper cast a reproachful look after the men as they only gave him a nod instead of "standing 'em up all round." And it was well; many a man makes a failure, not only in shooting bnt in other undertakings, by an untimely indulgence of his appetite. Rifiemen may think that a drop of the "creature" steadies the nerves before a contest but it never pays in the long run to fill up on Dutch courage. But as this is a shooting match instead of a temperance lecture it is best to proceed. It was decided to shoot off the twenty-five-shot pistol match first, so they went to the 33⅓-yard range. The day was disagreeable and a biting cold wind came in through the Golden Gate freighted with the essence of an Arctic climate that made the dignified Colonel, the massive Linville and the lengthy Carr perform strange war-dances and clap tbeir hands together to keep the blood in circulation. Owing to the unfavorable surroundings the scores made as below shown are very good:

Col. H. S. Beaver	5 5 5 5 5 5 5 5 5. 4	
	5 4 5 5 5 5 5 5 5 4	
	5 4 5- 5 5	
Total		121
P. D. Linville	5 4 4 5 5 5 4 5 4 5	
	4 5 5 5 4 5 5 5 5 5	
	5 5 5 5 5	
Total		119
Howard Carr	5 4 4 4 5 5 5 5 4 4	
	5 5 5 5 5 5 5 5 5 5	
	5 5 5 5 4	
Total		119

Linville and Carr tied in the number of points but Carr making a four on his last shot, put the first-named far ahead according to Creedmoor. The marksmen then took their rifles in hand and tried their luck on the 200-yard range. The sky being partly covered with clouds made just shade enough to show the bullseye with remarkable distinctness in its white background. Beaver and Linville led off with a five and laughed at Carr for beginning with a four, but ere tbe close of the day the laugh was on the other side. Mr. Carr and Mr. Beaver sbot a Hotchkiss military rifle and Mr. Linville the Sharps Borchard. Several times Linville's cartridges missed fire but these defective cartridges bronght out bullseyes whenever they were tried the second time. In this match Mr. Carr wore the eagle's feather and the following score shows how promiscnously he scattered in the fives:

H. Carr	4 5 5 5 4 5 5 4 5 5	
	5 4 5 4 5 5 4 5 5 5	
	5 5 4 5 4	
Total		117
Col. Beaver	5 4 5 4 5 4 4 4 5 4	
	4 4 4 4 5 4 5 5 5 5	
	4 5 4 5 5	
Total		112
P. D. Linville	5 4 5 4 5 5 4 4 4 4	
	5 5 4 5 3 4 4 5 4 4	
	4 4 4 4 4	
Total		107

As will be seen by adding the scores made with the rifle to those made with the pistol, Howard Carr took the first honors with 236 of a possible 250 points; Colonel Beaver second with 233 points and Officer Linville third with 226 points. After this match was finished there were two small matches shot off of five shots each, one for the lemonade and the other for cigars. Talk abont men shooting for money or glory, why, their best scores would be small compared to the scores made by B., L. and C., as they held their eyes on the target and their thoughts on Capt. Siebe's refreshment stand. After getting their lemonade (?) and cigars the marksmen started for the city by the sun-down sea.

The 100-Yard Target.

Riflemen will no donbt be pleased to learn that a new target will be pnt up at the Shell Mound Park range. This target will be at a range of 100 yards, thus enabling those who desire to become experts as rifle shots to begin at the foot of the ladder and gradually work up. There are some who have an idea that one who can hit the bullseye at 100 yards can do as well at 200 yards. They argue that a bullet that hits the bullseye at 100 yards will just as well hit the bullseye at 200 yards. They do not stop to reason that the bullseye is either six or eight inches in diameter, and a bullet that hits three inches from the center of an eight-inch bullseye at 100 yards will miss the black disc by two inches at the 200-yard range. Shooting, like any other accomplishment, requires not only practice, but that the aspirant should begin by creeping before he can walk the path of a first-class rifle shot. It is at the request of Companies C and G, First Regiment, N. G. C., that Capt. Sieby will lay out the range and arrange this target. These companies have divided their numbers into four classes, the first and second classes to shoot at 200 and 500 yards, the third class at 200 and the fourth class at 100 yards. To-morrow C and G hold their regular monthly meeting, and there will be no excnse for the non-attendance of their members, as they can use any range they wish, from 100 to 500 yards, and as competent judges will place each man in the class he is best fitted to fill, it will do away with embarrassment a third or fourth-class marksman feels when he is shooting with the first-class men. Few men like to feel like a little dog among large ones, and few—there are exceptions—like to consider themselves mastiffs among small pups. This new addition will be a valnable one to our none too elaborate facilities for rifle practice.

Shell Mound, February 1.

On the first day of February there was a rifle match between the veteran Nic Williams and the recently-fledged sharpshooter Mr. Ed Hovey, both of Oakland, in which the vet. was beaten seven points. Each nsed the weapon of his choice, Nic Williams his old Sharps and Ed Hovey a Winchester. The following are the scores.

Ed Hovey	5 4 5 4 4 5 4 4 5 4—44	
	4 4 4 5 4 4 5 5 5 4—44	
	5 4 5 5 5 5 5 4 4 3—45	
	4 4 4 4 4 4 4 4 4 5—41	
	4 5 5 5 5 4 5 5 4 5—47	
Total		221
Nic Williams	4 4 4 4 5 4 4 4 4 4—41	
	4 4 4 4 4 4 4 4 5 4—41	
	5 5 5 4 5 5 4 4 4 4—45	
	4 4 5 5 5 4 4 4 4 5—44	
	4 4 4 5 4 5 5 4 4 4—43	
Total		214

The shooting was over the 200 yard range.

Another Match.—The spirit of friendly competition seems to have taken a greater hold on some of the members of the San Francisco Fusileers, Company C, tban is manifested by any other company of the National Guard. No sooner is one match decided than another is arranged. To-morrow there will be a match shot at Shell Mound Park among H. J. Mangels, L. Haake, Chas. Thierbach and O. Lemke. The conditions of the match are 40 shots at 200 yards. There is a small purse also in the conditions, but is only just large enough to make it interesting.

For Glory.—On the 22d of this month there will be a 100-shot rifle match between Col. Beaver and Howard Carr. It is only a friendly match, and they are also going to try and beat the best score made in this State by Fred Kuhnle only a few weeks ago at Petaluma. Kuhnle's score was 457 points of a possible 500 on the 200-yard range. Mr. Carr has already made 456 points, which was followed very close by several good scores made by Col. Beaver. Mr. Kuhnle may well look to his laurels, for he has first-class shots close up to his best efforts.

The Schuetzen Club.—The California Schuetzen Club held their regular monthly competition meeting last Sunday at Schuetzen Park, Alameda. The following are the winners of medals and their scores: Champion goblet, won by Philo Jacoby, with 412 rings; tbe first-class medal, F. Kuhls, 403; second-class medal, F. Krahman, 376; third-class medal, Mr. Eckmann, 349; fourth-class medal, J. F. Sarcander, 268.

The San Francisco Schuetzen Verien.—At Schuetzen Park last Sunday the above named rifle club beld their regular monthly shooting festival. Tbe winner of the first prize was Philo Jacoby with 27 points out of a possible 30; second, F. Krahman, 24; third, K. Wertheimer, 24; fourth, F. Boeckman, 23; fifth, F. Freese, 22; sixth, Mr. Zecher, 22; seventh, J. C. Waller, 21; eighth, John Horstman, 21; ninth, D. Waller, 20; tenth, C. C. Rholfs, 19.

The Target at Sonoma.

Tbe Sonoma Rifle Club shot a match on Thursday of last week for a championship medal and two cash prizes. The day was unfavorable for fine work, gusts of wind and snow squalls interfering unpleasantly. The following is the score at two hundred yards in a possible 105:

F. Sutton	91	A. Graham	86
H. Nelson	91	M. B. Moody	82
B. L. Radovich	88	E. A. Rodgers	66
H. H. Rowell	88	A. M. Divoll	64
S. S. Bradford	87	Ed Parsons	59

In the contest between Sutton and Nelson for the medal Sutton was victorious.

To-morrow—There will probably be a lively time among the riflemen at Shell Mound to-morrow if the weather is fair. The 100 shot match at 200 yards between P. D. Linville and Geo. H. Brown will come off to decide, if our information is correct, who is the best sharpshooter of the two and also who will become the possessor of a purse of $200. The Mangels-Lemke-Haake and Thierback match will interest a great many of the riflemen who have closely watcbed the shooting of these men on former occasions. The monthly shoot, elsewhere mentioned, of Companies C and G, will be of much interest to all connected or in any way interested in military affairs. The first-class shots of these companies have always been at the head of all military shooting on this Coast. It might be well to stir them up a little for neglecting this practice, by whispering to them that they may again lose the Pacific Coast trophy of the California Rifle Association if they continue to neglect practice. Several small matches are expected to come off beside those already mentioned.

THE GUN.

Trap Shooting at Stockton.

We take from the Stockton *Herald* the following notes of trap shooting in that city last Thursday. The shooting was at the grounds of the O'Neal Gun Club at the Hohenshell ranch:

The first match was at 6 birds each, 21 yards rise. L. Leffler, C. A. Merrill, C. J. Haas and F. Lastreto were handicapped by a rise of 26 yards. The entrance was $2 50 each, the money to be divided into four prizes. The result was as follows:

L. Leffler	1	1	1	1	1	1—5
C. A. Merrill	1	1	1	1	1	1—5
C. J. Haas	1	0	w			
F. Lastreto	0	w				
John Swain	1	1	1	1	1	1—6
F. White	1	0	w			
B. Hohenshell	1	0	w			
E. Leffler	1	1	1	1	1	0—5
F. Post	1	0	1	1	1	1—5
Frank Post	1	1	1	1	1	1—5
L. Journeay	0	w				
H. Grattan	1	1	1	1	0	w
Geo. Smith	0	0	w			

The money was divided between those having perfect scores.

The next was a similar match, Mr. Burnett being also handicapped, and resulted as follows:

B. Hohenshell	1	0	w			
J. Swain	1	1	1	0	w	
Frank Post	1	1	0	w		
H. Grattan	1	0	w			
E. Leffler	1	1	1	1	1	1—6
F. White	1	1	1	1	1	0—5
L. Journeay	1	1	1	1	1	1—6
C. J. Haas	1	0	w			
F. Lastreto	1	1	1	1	1	0—5
J. Burnett	1	1	1	1	0	w
F. Post	1	1	1	1	1	1—5
C. W. Yolland	1	0	w			
L. Stevenson	1	1	1	1	1	0—5
F. Leffler	0	w				
C. A. Merrill	1	1	1	1	1	1—6
J. Williams	0	w				

The money was divided as before.

The next match was at six birds, 26 yards, the bandicappers being compelled to take 30 yards rise. Both barrels were used with the following result:

Frank Post	1	1	1	1	1	1—5
B Hohenshell	1	0	w			
J. Swain	1	0	w			
G. Smith	0	w				
E. Leffler	1	1	1	1	1	1—6
J. Burnett	0	w				
F. Leffler	1	1	1	1	1	1—6
L. Journeay	1	0	w			
H. Grattan	1	1	1	1	1	1—6
F. Lastreto	1	1	1	1	1	1—6
J. Williams	1	0	w			
F. White	1	1	1	1	1	1—5
C. A. Merrill	1	1	1	1	1	0—5
Fred Post	1	1	0	0		

There were so many sixes in the score that triggers were tried again between those having killed all their birds and tbe result was as follows:

Post	1	1	1	0—3
E. Leffler	1	1	1	1—4
F. Leffler	1	1	1	0—3
F. Lastreto	1	1	1	1—4
F. White	1	1	1	1—4

The three fours divided the first three prizes, the threes the fourth.

Then came a match at five double birds, $10 entrance, 18 yards rise, one pot of the money. It resulted as follows:

Frank Leffler	11	10	11	11	10— 8
C. A. Merrill	11	11	11	11	01— 9
C. J. Haas	11	11	11	11	11—10
F. Lastreto	11	01	10	11	w

Lastreto killed the bird indicated by the first goose-egg in his score, but it was decided that it was sitting on the trap and he lost it in his score. Haas pocketed tbo coin.

Then came the closing match, which was similar to the first one. Following is the score:

B. Hohenshell	0	1	1	0	w	
F. Post	1	1	1	0	0	1—4
L. Journeay	1	0	1	1	1	1—5
J. Williams	1	1	1	1	1	1—6
Frank Post	1	1	1	1	0	0—4
J. Swain	1	1	1	1	0	1—5
C. W. Yolland	0	1	1	0	w	
F. White	0	1	0	w		
H. Grattan	0	1	1	1	1	1—5
A. E. Mayer	1	0	1	1	1	—5
F. Lastreto	1	1	1			
C. J. Haas	1	0				
F. Leffler	1	0				—5

C. A. Merrill.....1 0 1 1 1 1—5
J. Stevenson.....1 0 0 w

There not being birds enough to shoot off the ties Williams and Lastreto divided the first and second moneys, and the six with scores of five each divided the balance.

During the earlier part of the day the birds moved dull and would not fly well, but at the later trials the birds were strong and tried hard to get away.

The Game Preserve System—Cause and Cure.

In the annual report of the Trustees of the Cuvier Club of Cincinnati, Ohio, the following discussion of the preserve system and how it may be avoided occurs:

The proper legislation in regard to the game of the country and its strict enforcement is not only becoming of more consequence daily, but it is likely to be beset with a complication which has not heretofore arisen, and which now arises because, principally, of the absence of such legislation heretofore, or the lack of its enforcement.

The need of outdoor relaxations and pastimes is becoming recognized in all our business circles, and among these pastimes none stand in higher repute as a health-giving occupation than field sports. So that, in addition to the question of food supply, we have now the question of health supply. The pot-hunter and the merciless depredator have to a large extent so depopulated the country of game, in many sections, as to render its pursuit a futile undertaking. They have defeated the passage of laws when they were able, and unfortunately in too many instances they have proved themselves to be entirely able. They have disregarded laws whenever they could be sure they would not be prosecuted, of which, unfortunately, they were too often assured, and have slaughtered indiscriminately, either from motives of gain or mere recklessness. A public sentiment supported them generally up to the time when the influence of clubs like this produced a better sentiment; and the feeling prevailed that the enactment and enforcement of game laws was an invasion of their private, personal rights and liberty, up to the time when this and similar clubs made it manifest that the license accorded to them was an invasion of the rights of the general public.

The game which the clubs have purchased at their own expense and turned out to restock the depleted country has, in many instances, shared the fate of its predecessors, and been ruthlessly destroyed. And added to all this, the landowner has constantly asserted his rights of ownership in a manner so wholly repugnant to the rights of sportsmen that bitter hostility has ensued between them.

Out of this state of affairs, and from the increasing desire to enjoy field sports uninterruptedly, and backed by the increasing wealth of the country—together with the feeling that the sportsman can also become a landed proprietor, and as such deny to others those rights and privileges which were denied to him—has come the new aspect to which we referred. It is the formation of game clubs by sportsmen who purchase the land, and establish the strictest proprietary rulee, which they enforce by a private police. Such clubs are multiplying at an astonishing rate. They are established in the East, in the West, and along the whole line of our sea coast, as well as upon our inland lakes. They have bought immense tracts of land for such purposes, and are buying and consolidating wherever practicable.

These parties, by purchase, become the proprietors of the soil. They become the absolute owners of all game which is reduced to possession by them on their soil. They forbid all unauthorized entrance upon their grounds, and prosecute for all infringements of their rules.

Exclusive possessory rights have been announced and sustained by several of the highest judicial tribunals, with the Supreme Court of Ohio among the number. The doctrine of exclusive possession upon one's own land, and also upon the waters which cover the land, has thus been fully affirmed.

It is evident, therefore, that so far as the features and consequences of such organizations extend we are rapidly drifting into the English theory and system of ownership and preservation of game. In fact, one of the leading sporting newspapers has not hesitated openly to advocate that system.

The English system, with all the obnoxious laws necessary to maintain it, is not in consonance with the spirit of our institutions, and we do not desire to see it engrafted upon our country if it can be avoided. There is one way in which its further spread can be prevented, and probably only one way. And that is for all the people at large to become earnest assistants of the clubs and aid by personal and moral support, and with pecuniary assistance if needed.

If through such clubs game laws can be strictly enforced, game will again be plenty, and all who will, rich or poor, may enjoy the pursuit of it. If through such clubs the landowner can be brought to acknowledge and permit the qualified right of entry of the sportsman, and the sportsman can be brought to conform to the proprietary rights of the landlord, the pursuit of the game will cease to be attended with the controversies which now already ensue.

The result will be that, with a land teeming with game, and with its proper pursuit made pleasant and successful, the markets will soon be filled with game food at the cheapest prices.

If, however, this cannot be brought about the reverse will follow. The proprietary system will soon become universal and permanent. The preservation of game will become a private affair, the pursuit of it will be a special and costly privilege, and its supply and price will be at the caprice of a few, to the detriment of the many.

As an illustration of the excess that may be produced by careful preservation, we copy the following statement from an English paper: "The great bag of the year has been made at Croxteth, where the proprietor and his friends killed 7,674 head in five days, averaging 1,279 head for each of the six guns. Of these there were 5,543 pheasants and 1,250 hares. The wildfowl made no small item in this enormous bag—140 wild ducks, besides snipe."

When the money value alone of this yield is considered, and the fact that if it had been in this country it would have been distributed among the people, it furnishes an irrefutable argument for preservation, which landholders would do well to remember.

California Lion Killed.—Billy Boness, a well-known rancher and hunter of Chico canyon, is in town to-day exhibiting a large California lion which he killed Tuesday afternoon. His dogs treed the beast. Boness tried to kill the lion with a revolver, but his aim was not very good, and he had to go to his house, a distance of several miles, and get his trusty rifle. During his absence the dogs kept the big cat in the branches of the tree. The animal measures seven feet and seven inches from the tip of the tail to the nose.—*Chico Record.*

A Gilroy Hunt.

The Gilroy *Advocate* of January 27th contains the following account of the Rod and Gun Club hunt, which took place January 25th under the leadership of Judge Leavesley and John Holloway: The millions of ducks at Soap lake and the flocks of smaller game birds in the covers of the valley and foothills received a regular fusilade from the gunners engaged in the contest. Each man brought in his kit at night, making the rear premises of the Southern Pacific Hotel look like a poultry market. Of the two teams engaged that under Leavesley, according to the score annexed, made the best average. The club supper or game feast took place Saturday night at George Seaman's hotel. The following score is reported:

THE LEAVESLEY TEAM.

A. B. Tryon, 7 teal	35 points
Geo. Seaman, 16 teal, 1 pigeon	90 "
Judge Leavesley, 4 rabbits, 24 quail, 2 sparrow-hawks	240 "
Harry Frutig, 76 ducks, 1 mallard, 1 honker	425 "
J. R. Payne, 5 quail, 2 robins, 2 ducks, 1 rabbit	68 "
Dave Dunham, 35 quail, 2 cottontails, 2 jacks	330 "
Dr. Lubbock, 1 jack, 1 cottontail, 6 quail	73 "
Sue Short, 2 jacks, 1 cottontail, 3 quail	64 "
Total	1,325 "
Average	165.62

THE HOLLOWAY TEAM.

E. H. Farmer, 15 quail, 1 jack	135 points
John Paine, 1 quail-hawk, 1 curlew, 1 gray goose, 2 spoonbills, 3 widgeons, 1 teal	61 "
Elmer Rea, 9 teal, 10 widgeons, 2 canvasbacks 3 sprigs	130 "
Chas. Burgess, 9 teal, 1 duck, 1 red-head	55 "
Wm. Phegley, 12 quail, 1 jack, 1 cottontail, 1 canvasback, 1 hawk, 4 robins, 1 sprig	205 "
Geo. Holloway, 21 quail	168 "
Henry Holloway, 13 snipe	104 "
L. Loupe, 1 hawk, 1 mallard, 9 ducks	61 "
E. R. Wright, 1 mallard, 1 snipe, 16 ducks	98 "
John Holloway, 3 canvasbacks, 51 ducks, 1 curlew, 1 sparrow-hawk	304 "
Adam Herold, 18 ducks, 1 snipe, 1 sparrow-hawk, 5 teal	127 "
D. C. Whitney, 15 ducks	75 "
Total	1,523 "
Average	127 "

Martin Briggs, of the Leavesley team, failed to report.

Alviso and Alvarado.—With the hunters on the Alviso and Alvarado marshes last Sunday it was a cold day in both meanings of the term. Usually a strong cold wind keeps the flight of water fowl moving, but on that day it seemed to have the opposite effect, to drive them to protected sloughs and tules out of the way of the wind and also unapproachable for the hunters. The number of gunners was not so great as usually go down on Sunday nor was the size of the game bags as corpulent as they sometimes are. Instead of the afternoon and evening trains bringing home jolly faced, laughing hunters, fighting dogs and the usual amount of hunting yarns, they brought home a handful of benumbed, silent hunters, minus the game, who, instead of laughing and telling interesting or humorous anecdotes or adventures, only gave vent to their feelings by cursing a lot of cold, shivering dogs, who were fighting for the possession of the hunting bag on which they could curl up and shake to their hearts' delight. Not till they reached the steamer did they begin to thaw out and even the inquiry of "what luck have you had?" would make the gunner as silent as the Man in the Iron Mask. Take it all in all, those who went down for sport and recreation returned very much disappointed.

Deer in Lassen.—The Board of Supervisors recently adopted the following regulations for the protection of deer in Lassen county: Every person who, between the first day of January and the first day of July, in any year, hunts, takes, kills or destroys any antelope or deer, is guilty of a misdemeanor. Every person who at any time hunts, takes, kills or destroys any antelope or deer, except the same is used or sold for food in Lassen county, is guilty of a misdemeanor. Every person having in his possession any of the game mentioned in the foregoing sections, at a time when it is unlawful to kill the same, is guilty of a misdemeanor. These regulations change the game season from November 1st to January 1st, and make it a misdemeanor to kill deer and take them out of the county, and also punishes the killing of deer except they are actually used for food. A Sportsman's Club is being formed, the object of which is to enforce the law, and anyone detected in its violation will be prosecuted.

San Bruno Marshes.—These marshes last Sunday presented a much different appearance from those just across the bay. The heavy wind that drove the ducks to shelter at Alviso only kept them moving on the wing at San Bruno. One hunter said he never saw so many canvasbacks flying in that vicinity as he saw that day. There were not many hunters down and what there were, so we have been told, could not be classed as first-class shots, but they all had as much sport as they could desire, and as much game as they could get with the amount of ammunition that they carried down. There were at least a dozen persons who bagged from ten to twenty ducks, the majority of which were cans.

How to kill Squirrels.—Samuel Eldridge, who cultivates the soil in the vicinity of Woodbridge, has discovered a way to kill squirrels, which he thinks is worthy of trial by all farmers who are troubled by these pests. He saturates a small piece of burlap with coal oil, after which he sprinkles it with sulphur. Then he rolls it up, wraps a paper around it, sets it on fire and sticks it in the hole. The burning sulphur suffocates all the animals in the hole, often killing cottontail rabbits as well as squirrels. Mr. Eldridge regards this as the best squirrel exterminator he has ever tried, and he has tried many.—*Modesto Journal.*

Among the several good bags made at the Alviso marshes last Sunday, Mr. Buggs and Hoefling Jr. together brought down 31 ducks. Mr. L. B. Cooper scored 21; Mr. Harper and McClunia bagged upwards of 40; Mr. Drinkhouse was satisfied with shooting off considerable ammunition and getting four ducks; Mr. Stack was the most unlucky man on the marshes; he had only one duck to bring home. This is the second time this year that this usually fortunate hunter has returned with one solitary little duck. No doubt that if Mr. Spencer had not been sick there would have been a grand slaughter of innocents.

A party of hunters composed of Messrs. Wright, Higgins, Rondeau and Stackpool, which has just returned from an extended trip through the north, was out near the Mission San Jose last Sunday, but its luck was not of the best. The whole party only bagged eighteen quail.

A fifteen-year-old boy killed 108 ducks at four shots on the San Joaquin river the other day.

The Tuscarora (Nev.) *Times-Review* in an article on game laws pays its respects to Lo: In the matter of game and fish we are unable to see why the Indian should not be subjected to the same rules as a white man. The fish and game laws were made for the sole purpose of protecting and increasing those very important food products. The very same redskins who have slaughtered the 3,000 deer, as dirty pot-hunters would do, in all probability will before spring be begging around hotel kitchens for cold scraps of grub. To throw 300,000 pounds of venison away is an outrage which should not be permitted, and we could not blame the people of Calaveras county if they should adopt the rule of Indian for deer, and shoot the last one of them who were engaged in such wanton destruction of food. We must confess that we were never an admirer of "Cooper's Leather Stocking Tales," and are fast approaching the point where we shall advocate the right of the State to legislate for the Indian as well as the white man. In this matter California should unite and enact similar laws.

Mr. Bruno Gundlanch recently killed on his father's farm, near San Jose, an albino hawk, the first of which we have any knowledge in this vicinity. It is most beautifully marked, being a clear white flecked with bronze, and having a bronze ruff and tail feathers.

Mr. Putzman was down near the Bridges last Sunday and came home with a nice little bag of snipe. He shot several ducks, but they were so poor in flesh he would not shoot any more, though a great number arose near him.

THE KENNEL.

The International Bench Show.

The arrangements for the bench show that is to take place at the skating rink at Washington, D. C., from February 20 to 23, are rapidly approaching completion. Applications for entries have already been received from Massachusetts, New York, Rhode Island, Pennsylvania, Michigan, Wyoming, Maryland, Virginia, South Carolina, London and Montreal. The exhibition is to be in charge of Mr. Charles Lincoln, who has conducted nearly all the successful shows in this country, including those in New York and at the Centennial. There will be seventy-one classes and the cash premiums will amount to $1,000, besides the special prizes, which it is expected will exceed that amount. Mr. Henning has already given three hunting suits, to be compete for by owners of sporting dogs. The grand medal won at the Crystal Palace, England, by Mr. C. H. Mason is presented by him for competition by the winners of other prizes. Special prizes are to be given for dogs owned in Washington, and extra special prizes for dogs owned in New York, Philadelphia and Baltimore. A cable dispatch has been sent to the Prince of Wales, asking him to allow some of his dogs to be shown, and a special invitation will be tendered to the Marquis of Lorne. The judges will be John S. Wise of Virginia, for English and Gordon setters; C. H. Mason of Bradford, Yorkshire, England, for Irish setters, pointers, spaniels, hounds and fox-terriers; James Watson of New York, for mastiffs, St. Bernards, Newfoundlands, collies and all other non-sporting dogs. Although this, the first bench show given in Washington, promises to be a successful one. The number of dogs exhibited will be large, and as Congress is in session the attendance no doubt will be numerous.

Stockton Courses.

Last week a number of Stocktonians including James Christy, Max Magner, J. Dominico, Joe Burnside, Ben Samuels, J. Dougherty and James Squale held a coursing match at Lockford near that city.

Max Magner entered Spotter, Joe Burnside and Minnie Flood; James Christy, Smuggler; Ben Samuels, Silver; James Squale, Lucky Baldwin; Tom Dougherty, Tommy Dougherty, and Mr. Martin, Fly, Odd Fellow and a slut.

The first match was between Fly and Spotter and was won by the latter. The second was between Joe Burnside and Martin's slut and was won by the former. The third was won by Minnie Flood over Lucky Baldwin. In the fourth race Silver beat Lucky again and there was then a draw between Odd Fellow and Tommy Dougherty.

In the races between the winners, Smuggler beat Silver, and Spotter beat Joe Burnside. Smuggler then got away with Spotter and came out No. 1 in the matches.

After these races were over a match for $20 a side was made between Lucky Baldwin and a hound belonging to Tom Mead which was won by the former. Max Magner acted as judge, John Dominico as slipper and James Christy as president of the meeting.

California Coursing Club.

Last Wednesday night the members of the California Coursing Club held their regular monthly meeting at 539 California street, Dr. Sharkey presiding. The first business transacted was the selection of officers for the ensuing year. Dr. Sharkey declined a re-nomination, and ex-Senator J. C. Murphy was unanimously elected President, John Hughes Vice President, J. F. Carroll Treasurer and J. J. Murphy Secretary. Treasurer Carroll reported the financial affairs of the club in a very prosperous condition. Then came a discussion as to the holding of a spring meeting. It was finally agreed to run at Merced on March 28 and 29, the club to leave San Francisco by the 4 o'clock boat on the 27th of March. The meeting will be a stake for dogs of all ages, open to all dogs on the Pacific Coast. Judge and slipper to be chosen by the nominators. It is not known at present how many dogs the club itself can muster, but as this will be about the last match of the season a large number of entries will probably come from the outside.

F. H. Bates proposes to match his Irish setter Joe Campbell against either of the winners of the All-Aged Stakes at the national field-trials at Grand Junction, Tenn., for a three days' hunt on quail, in order to test the question of the superiority of the strains.

The Sonoma and Marin Coursing Club will hold its next match on Thursday, the 15th, at Mecham's Ranch. Many prizes will be given to winners.

Judging from the preparations being made to cultivate hops, the yield this year on the Mokelumne river will be greater than ever before.

Two gentlemen at Olema last week caught seven beautiful salmon trout that weighed from ten to seventeen pounds each.

Beaver-trapping is one of the pastimes along Feather river.

An Ostrich's Nest.

After pairing, the ostrich begins to make his nest. It is the male alone that performs this duty. To do this it squats npon the ground, and, balancing itself npon the sternnm, it scratches up the earth with its legs and throws the sand behind it. When it has dug ont enough on one side to snit it, it turns around and begins to dig on the other side, and continues this operation until it has made a hole large enongh to sit in comfortably. The nest is elliptical in shape, and is abont 0.25 meters deep, 1 meter wide and 2½ meters long. A few days after the nest is finished, the female begins to lay one egg on every alternate day for eighteen or twenty days. She then rests for a while, and then begins to lay more. A pair of ostriches yield 40 eggs. This is only the minimum number, which is always reached. It is not nnnsual for a well-fed, well-kept pair to yield fifty or sixty eggs. The eggs are placed so as to leave no space between them. They are sat npon at first for several hours each day and finally altogether. The male and the female brood alternately. At night the male is always on the nest, as it possesses greater warmth than the female. When the birds relieve each other on the nest, the new comer turns over each egg in order that the portion which has lain against the nest shall receive the warmth of the brooder. These birds perform their dnties with the greatest skill, withont any noise or breakage of eggs. They sqnat down and with their head and neck rake np and overturn every one of the eggs, one after another, without neglecting a single one. The incnbation lasts forty-five days on an average, sometimes fifty days, but never continnes beyond that. When the chicklings hatch ont they can be heard trying to break the shell of the egg. Sometimes they sncceed in doing so, bnt nsnally the father breaks the eggs nnder his breast bone, and seizing with his bill the inside skin, tears it and frees the chicklings. Upon first reaching the air the chickling remains limp and weak. Bnt the warmth of the parent soon revives it, and a few honrs afterward it begins to run about the nest, exercising its long legs, tottling over at each step, and recommencing its stnmbling jonrney. Fonr days after their hatching, the chicklings begin to eat. They run after insects and swallow small pebbles. The father and mother do not help their little ones to find food.

"I have been afflicted with an Affection of the Throat from childhood, caused by diphtheria, and have nsed various remedies, but have never fonnd anything equal to BROWN'S BRONCHIAL TROCHES."—*Rev. G. M. F. Hampton, Piketon, Ky.* Sold only in boxes.

The State Agricultural Society.

The following is a synopsis of the annual report of the State Board of Agriculture prepared by Secretery Smith and adopted by ths Board at the annual meeting last Monday.

His Excellency, George Stoneman, Governor of California, Sir: In compliance with ths law the State Board of Agriculture of California present herewith their annual report for the year 1882. In presenting this report we feel gratified at the progress mads by ths society, and ars assured that its usefulness can no longer be doubted. The demand for improved live stock, occasioned by the competitive spirit svinced at our annual exhibitions by breeders, has increased since the organization of this society from mers naught until we ars now looked upon with astonishment, and the highest encomiums ars paid to us by our Eastern brethren upon the favorable outgrowth of California's breeding establishments. The superior qualities, both as to speed and endurance, of California-bred horses, have awakened a desirs among foreign purchasera to obtain them. The demand far excesds the supply at ths prssent tims, but ws hope in the near futurs to bs able to accommodats all who desire to purchase. The outlined policy of ths agricultural societies of this State, in offering lsrgs premiums to bring out the speed and endurance of all classes of nntried horses, is having ths desired sffect in developing the most desirable and valuable qualities of this animal. We bave improved upon all classes from the Amsrican borse of twenty years ago, when that class was ths only recognized ons paramount to the common mustang. We are now abls, not only to show ths thoronghbred, but othsrs equally as valuable from a "blood" standpoint. There is the Norman and Percheron, which classes are now bred to an numsrous extent. A large per cent. of our draft horses are of these popular breeds, and the demand for them has increased so that breeders are turning their attention to the importation of this class. A glance at the entries made at the last fair by J. B. Haggin in the first department will give you some idea of the enormous classes that are now being bred in this State, nearly all of which were imported by that gentleman with a view of improving the stock and opening out a largsr field which will give California a greater variety for the purchaser to select from than any of our sister States. This interest is young, but is fast developing; tbe climate being especially adapted for this business, we may hope to see it take the lead in a very short time, when California will be looked upon, as old Kentucky was in her younger days, as the animal-prodncing State of our Union.

The demand for our improved cattle is also great, and we cannot as yet fnlly supply the home wants of our small breeders, their desire to improve their herds having grown eqnally with the snpply of the original importers. This interest is also growing, snd is aided in every conceivable way by this State Board. Many imagine that there is a great difference in premiums awarded between horses and cattle; it has been the object to as nearly equalize these great interests as the supply would warrant. Upon an examination of our premium lists, it will be seen that the totsl amount of premiums given to all classes of horses amounted in aggregate to $2,840, while those to cattle of all classes are $2,565, which is but $275 less than the horses; and taking into consideration the amount of money invested in each, the difference would result more favorably to the cattle-breeders. Many labor nnder the false impression that too much attention is given to races, while they are more than self-sustaining, and are to a great extent the "pleasure" after the "work" is done. The annual fair of this Board is looked upon as a holiday week of recrestion and sport by the gensral public, and this Board have labored to satisfy all. The entire morning and part of the afternoon are devoted to the examination of our argricultural products, our inventions, our machinsry and implements, the various breeds of cattle and horses, swine, sheep, poultry, etc., that are exhibited in the available places throughout ths grounds. Then, after this is dons, peopls naturally wonder what they will do the remainder of the day. Ths Board has looked out for this contingency, and has providsd for their entertainment a more than self-sustaining amusement and interest—an amussment to those who cars not for the breeding qualities, and an interest for those engaged in breeding. The stock raiser who desirss to combins speed and endurance with other qualities is bere enabled to judgs for himself. To sbow that no money appropriated by the Stste is used for this, ws submit our ledger account on racs No. 5, given at the Stats Fair, 1882: Trotting, 2:25 class; purse, $1,200, mils heats, best thres in five; $720 to first horse, $360 to second, $120 to third; entrance, ten per cent. on amount of purss.

Dr.	
To cash, first money	$720
To cash, second money	350
To cash, third monsy	120
	$1,200
Cr.	
By cash received from sntries made (9 at $120)	$1,080
By balancs paid by Society	120
	$1,200

Thus it will be seen that the society, after offering this $1,200 purse, is out of pocket only $120, the racing men themselves paying, in tbe way of entrancs monsy, the rsmainder. This is taken as an average case. The very next race eleven entrances were received, which more than paid ths deficit in the last race. Our detailed statement will show ths following comparison respecting the race account:

Dr.	
Added money purses	$10,650 00
Cr.	
Receipts from entries $4,895 00	
Receipts from privileges 3,126 80	—8,021 80
Balance	$2,628 20

The net amount that is actually paid ont of our receipts. Thoss of the park for the entire week, for admissions alons, amount to $11,683 50, and those of the pavilion, for the same time, $5,409 15. You will plainly ses that without this portion of our fair the premiums would have to bs materially reduced.

The annual fair is ussful and instructive, not only to the agriculturist, but to the mechanic, the artisan, the inventor and the professional man, each and all of whom are more or less benefited by sxhibits made. The Board is now endeavoring to perfect a plan of crop reports, which, if accomplished, will be valuable. The system originated with ths Department of Agriculture at Washington, and is now being rapidly pushed forward. Ths plan is to establish a correspondent in each county who has public spirit enough to report eacb month, npon blanks furnished, ths exact status of all crops. The difficulty experienced by us is that it is very hard to select a thoroughly responsible man who is willing to submit this information. In some cases ws havs succeeded, while in others we havs signally tailed. There is another proposition spoken of that we may adopt another year, to havs ths necessary blanks printed and placed in the hands of every man who rnns a thrasher, and when he shall havs completed his job, to sit down and copy from bill charged to farmer ths exact number of bushsls thrashed, and get at ths same time ths acreage upon which it was grown. Then at ths end of the year the export can bs deducted, and the remainder will sbow ths amount on hand. The Board desire the hearty co-operation of all agriculturists in this method to get the accurate statistics, so that the products of California may bs fully shown from the producers' estimates, and not the speculators'. Ths great drawback of ths Board in the past has been the indebtedness, which is now wholly wiped out, and the society is in better condition than it has been for years. The grounds are in good order, likewise the stabling and stands. The marked increase of California's industries and inventions has made it necessary for the Board to consider some plan for the erection of a desirable building, wherein the resources could be shown in a much larger sphere. The present building has proven wholly inadequate to accommodate the vast throng of exhibitors that apply each year for admission. It is contemplated to establish a permanent exhibition of California's products wherein could be placed for exhibition: First, the agricultural department—specimens of seeds, native woods, and other interesting natural products; second, a geological department; third, a mineralogical department; fourth, a zoological department; fifth, a department for antiquities. This exhibition to be open to all tourists and those interested in the products of our State. Such a plan is feasible, and can with little aid be accomplished.

The society being under the supervision of the State, the Board have thought proper to advise the location of a building to be known as the State Industrial Exhibition Pavilion, upon the grounds of the State located directly east of the Capitol. At a conference held with the Sacramento Board of Trade, it was agreed that the city and county of Sacramento should present the State with the sum of $40,000 to aid in the erection of said building, provided the State would agree to erect one. It is the earnest desire of all connected with the society throughout the State that a new building should be erected. The advantages gained and knowledge disseminated through our exhibitions is of vast importance to the State, and should be encouraged. We are no longer young, but fast approaching an age when we should be fully up in enterprises of this character as our sister states.

The object of this society being to encourage the cultivation of the soil, you will find several valuable papers herewith, pertaining to the mode and manner of cultivating the soil for various products. We also prssent herewith a map of California, with all information necessary to those wishing to migrate to this Stats. Our reports are sent to all the civilized portions of ths globe. This information will be disseminated in proper form.

FINANCIAL SUMMARY.

Amount on hand at commencement of ths year		$293 11
Totsl receipts from all sources		40,141 74
		$40,434 85
Total disbursements	$10,202 92	
Cash on band	231 93	
		$40,434 85

Market Report.

FLOUR—We quote: Best City Extra, $5 80@$6; Superfine, $5@$5 50; Interior Extra, $4 75@$5 50; Interior Superfine, $3 75@$4 50 ℔ bbl.

WHEAT—The market is strong in this grain and milling grades, choice, bring $1 90 and $1 85 and $1 87½ for good shipping qualities. Recent sales are No. 1 Whits, buysr February, $1 88½; No. 1 White do. $1 87@$1 87¾.

BARLEY—The market is strong and if any it has an upward tendency. The figures of recent sales are, No. 1 Feed, spot, $1 23½, do. March $1 22½ to $1 23¾; April $1 23¾ to $1 24; No. 1 Brewing $1 33½ offered and $1 27½ bid.

OATS—Fair Feed, $1 70@$1 75; Good, $1 76@$1 82½; Choice, $1 85@$1 95 ℔ ctl.

RYE—Business dull. Quotable at $1 55@$1 75 for fair to good.

FEED—Ground Barley, $28@$30 ℔ ton; Cracked Corn, $36 ℔ ton; Shorts, $17@$19 ℔ ton; Oilcake meal the oilworks sell to the trade at $35 ℔ ton, less the usual discount; Middlings, $23@$24 ℔ ton for lots at the mill.

HAY—Alfalfa, $13 50@$15; Wheat, $15 50@$17 50 Wild Oat, $15@$17; Mixed, $11@$15 ℔ ton.

STRAW—80c@$1 per bale.

PROVISIONS—Eastern Hams, 15½@16½c; California Hams, 16@15½c for plain, 15½@16c for sugar-cured canvased; Eastern Breakfast Bacon, 16@15½c; California Smoked Bacon 14@14½c for heavy and medinm, and 15@15½c for light and extra light; Clear Sides, 14½@14¾c; Pork, $18@$18½ for Extra Prime $20@$20 60 for Prime Mess, $23@24 for Mess, $25@$25 50 for clear and $26@26 50 for extra Clear; Pigs' Feet, $16@$18 ℔ bbl; Mess beef, $15 50 for bbls and $8 50 for hf bbls; Extra Mess Beef, $16 50 for bbls and $8 75 for hf bls; Family Beef, $18@18 50 ℔ bbl; California Smoked Beef, 12¾@13c ℔ lb.

FRUIT—We quote: Apples, 30@50c for common and 75c@$1 75 ℔ bx for good; Lemons, $6@7$ per box for Sicily; California Lemons, $2 50@$3 per box; Limes, $8@$9 per box for Mexican; Bananas, 1 60@$3 ℔ bunch; California Oranges, $2@$3 per box; Pineapples, $6@$8 ℔ doz. New crop Western Cranberries are offering at $15@$17 ℔ bbl.

VEGETABLES—We quote: Marrowfat Squash, $8 to $10 ℔ ton; Carrots, 30@50c; Turnips, 75c@$1; Cauliflower, $1 50 ℔ dozen; Cabbage, 75c@$1 ℔ ctl; Garlic, 2½c ℔ lb; Celery, 50c ℔ doz; Dried Okra, 20@30c; Dry Peppers, 10@12½c ℔ lb; Green Peas, 6@8c Green Peppers, 6c@8c per lb; Tomatoes, 6c@8c ℔ lb.

POTATOES—River Red, 65@85c; Early Rose, 70@95; Tomales and Petaluma, $90@$1 15 ℔ ctl Humboldt Red, $1 35@$1 45; Kidney and Peachblow $1 35@$1 45 per ctl; New, 3@3½c per lb.

ONIONS—For fair to choice, 75c@$1 35 is the range of prices.

BEANS—Bayos $4@$4 50; Butter, $3@$3 25 for small and $3 20@$3 50 for large; Lima, $3 65@$3 80; Pea, $3 10@$3 25; Pink, $3 50@$3 60; Red, $3 50@$3 60; small White, $3 10@$3 25; large White, $2 75@$3 ℔ ctl.

BUTTER—We quote jobbing lots: Fancy, 25@27c; choice, 24@25; fair to good, 20@23c; inferior lots from country stores, 15@18c; firkin, 22@24c for good to choice, and 18@20c for ordinary; pickled roll, 20@23; Eastern, 16@20c ℔ lb.

CHEESE—Firm. California, 14@15c for choice; 11@13 for fair to good; do, factory, in boxes, 14@16c; Eastern, 16@17c.

EGGS—California, 18@22c ℔ doz.

POULTRY—Live Turkeys, gobblers, 18@19c; do Hens, 19@20c; do dressed, 18@22c; Roosters, $6 50@$7 50 for old and $9@$10 for young; Hens $7@$8; Broilers, $6@$7, according to size; Ducks 9@$10 ℔ dozen; Geese, $2@$2 50 ℔ pair.

GAME—Market fairly lively. Quail, 85c@$1 ℔ doz; Mallard Ducks, $2 75@$3; Sprigs, $1@$1 25; Canvasback, $2 75@$3; Brandt, $1 25@1 50; Gray Geese $2@$2 50; White Geese, $1 25@$1 50; Honkers, $4@$4 50; Snipe, $2 25@$2 50 for English and 60@75c for common; Teal, 75@$1; Widgeon, $1@1 25; Hare, $1 75@$2; Rabbits, $1 25@$1 75.

WOOL—For choice parcels there is fair inquiry. We quote fall: San Joaquin and Coast, 8@11c; San Joaquin and coast Lamb, good, 9@11c; Northern Fall, free, 15@20c; Northern Fall, defective, 11@14c; Northern Fall, Lamb, 15@17c; free Mountain, 11@15c. Eastern Oregon, 16@22c; Valley Oregon, 22@26c. We quote spring California ℔ lb 14@20c.

HIDES AND SKINS—Dry hides, usual selection, 18@18½c ℔ lb; culls one third less, and Mexican Hides 1c ℔ lb less. Dry Kip, 18@18½c; Dry Calf, 19@20c; Salted Steers, over 55 lbs, 11c ℔ lb; Steers and Cows, medium, 10c; light do, 9c; Salted Kip, 15 to 30 lbs. 11c; Salted Calf, 14@15c ℔ lb; Salted Veal, 12½@15c; Sheep Skins, 25@30c for Shearlings; 30@50c for short, 60@90c for medium, and $1@$1 35 apiece for long wool and wool skins. Butchertown Green Skins bring higher prices.

TALLOW—Quotable at 8@8½c ℔ lb for rendered and 11@12c for refined, both in shipping order.

MEATS—Following are rates for whole carcasses from slaughterers to dealers:

BEEF—Prime, 9@10c; medium grade, 7½@8c; inferior, 5½@6½c ℔ lb.

VEAL—Large Calves, 8@9c; small ones, 9@10c ℔ lb.

MUTTON—Wethers are quotable at 5@5½c and Ewes at 4½@5c ℔ lb, according to quality.

LAMB—Quotable at 6½@7c ℔ lb.

PORK—Live Hogs, 6½@7c for hard and 5¾c@6½ for soft; dressed do 9@9½c ℔ lb for hard grain hogs.

STALLIONS.

MAMBRINO WILKES.

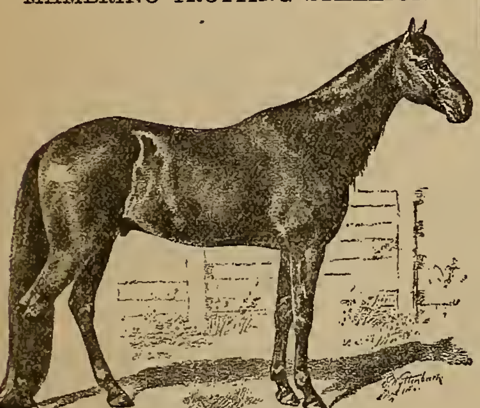
Black Stallion, sixteen hands in height, by George Wilkes, son of Rysdyk's Hambletonian, bred by B. J. Treacy of Fayette County, Kentucky. Dam Lady Christman by Todhunter's Mambrino or Idol, son of Mambrino Chief. Second dam by Pilot Jr. Third dam by Kentucky Whip. Idol's dam was thoroughbred and was by American Eclipse.

THIS IS THE LARGEST AND ONE OF THE BEST COLTS OF George Wilkes (weighing at this date 1,260 pounds) combining the Hambletonian and Mambrino strains and also several thoroughbred crosses. His colts demonstrate that he possesses in an eminent degree the same faculty of transmitting the family qualities to his offspring which put George Wilkes in the front rank as a sire of trotters.

Will make the ensuing season, beginning February 1st, 1883, at STOCKTON.

In putting the price by the season at the low figure of $40 the owner does not acknowledge, thereby, any inferiority on the part of this horse to any other sire of Trotters. **IRVIN AYRES.**

MAMBRINO TROTTING STALLION



ABBOTSFORD.

☞ Record at Six Years old, 2:21½. ☜

PEDIGREE.

BY WOODFORD MAMBRINO, HIS DAM COLUMBIA BY YOUNG Columbus. Woodford Mambrino by Mambrino Chief, his dam Woodbine by Woodford, a thoroughbred son of Kosciusko.

Woodford Mambrino is recognized to be the best son of Mambrino Chief. His own record is 2:21¼, and there are a large number of his get in the 2:30 list. Among them: Abbottsford, 2:21¼; Convoy, 2:22¼; Magenta, 2:24¼; Lady McFatridge, 2:29; Dacia, 2:29¼; George A. Ayer, 2:30.

Besides those having public records, he is the sire of the two celebrated mares owned by Robert Bonner—Manetta and Malice. Manetta, with a running mate, and harnessed to a road wagon, trotted two miles in 4:27¼, and Malice trotted a trial, on the same track, a mile in 2:19¾. Woodford Mambrino is also the sire of Princeps, the sire of Trinket; record, 2:14. Woodbine is also the dam of Wedgewood, record, 2:19. Young Columbus, the sire of the dam of Abbottsford, has nine of his get in the 2:30 list, so that on both sides of the house there are notable performers. Abbotsford is a rich rosewood brown, 15¾ hands, and of very high form. His get are very promising, his daughter Jasmine having won the Embryo Stake for yearlings in 1881, and every one which has been put in training has shown good speed.

TERMS.

Seventy-five dollars the season, to be paid before removing the animal. Mares not proving in foal can be returned the following season free of charge. Good pasturage at reasonable rates, and extra pains taken, but no liability for accidents or escapes.

LOCATION.

Abbotsford will make the ensuing season, 1883, on the ranch of S. B. Whipple, Esq., San Mateo, season commencing February 15th and ending June 1st, 1883. For full history see the issue of BREEDER AND SPORTSMAN of August 5th, 1882.

GEORGE BAYLIS, Agent, San Mateo, Cal.

ANTEEO.

DARK BAY COLT, NEAR HIND FOOT WHITE; FOALED MAY 5th, 1879; bred by Joseph Cairn Simpson, Oakland, California.

13th " By Spanker.

See Bruce's American Stud Book, vol. 1, p. 307, and vol. 3, p. 79.

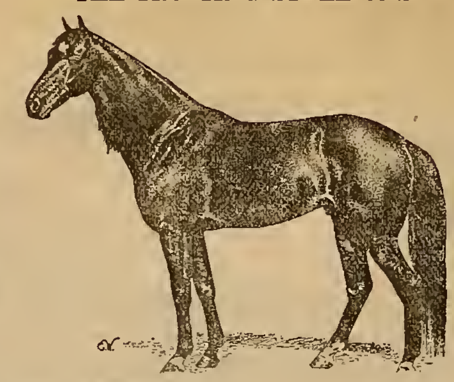
Will make the ensuing season, 1883, from February 15th to June 15th, at the Oakland Trotting Park. Terms $50 the season.

JOSEPH CAIRN SIMPSON.

Oakland or 508 Montgomery street, San Francisco.

STALLIONS.

THE TROTTING STALLIONS



SINGLETON AND LA HARPE.

SINGLETON WILL MAKE THE COMING SEASON, FROM Mach 1st to July 15th, 1883, at the farm of the owner, three miles north of Chico, Butte Co., Cal.

PEDIGREE.

Singleton is by Willie Schepper, a son of Rysdyk's Hambletonian, his dam Lightfoot (the dam of Pride) by Flaxtail, a son of Prudeu's Blue Bull.

DESCRIPTION.

Singleton is a dark brown horse, tan flanks and muzzle, a little touch of white on hind feet and one fore foot, and star in forehead. He is 15¾ hands high and weighs 1,100 pounds. He was bred by Dr. M. W. Hicks, foaled spring of 1878.

TERMS.

Fifty dollars the season. Mares not proving in foal will be bred the following season free of charge. Mares from a distance will be pastured without charge during the season. Mares shipped to Chico, consigned to me, will be received on arrival of train, and taken to the ranch. Mares kept in any manner their owners desire, at reasonable rates. There is every convenience on the place, boxes, paddocks and plenty of shade and water.

LA HARPE

Will also make a short season at the above place on private terms. La Harpe is by Fame, a son of Alexander's Belmont, his dam Prairie Bird by Flaxtail, the dam of Flight and Prompter. Address

J. T. McINTOSH, Chico, Cal.

THE THOROUGHBRED STALLION

WILDIDLE.

BY AUSTRALIAN.

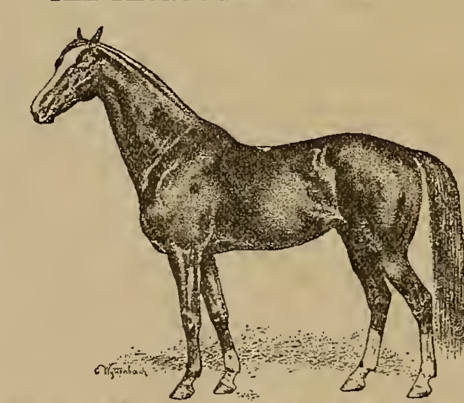
DAM IDLEWILD BY LEXINGTON.

THIS GREAT RACEHORSE AND SUCCESSFUL SIRE WILL make the season 1883, from Feb. 15th to June 15th, at Judson's Wildidle farm, Santa Clara. For terms and particulars apply to or address

JAMES & H. C. JUDSON.
Owners, Santa Clara,

Or to Wm. L. Appleby, Supt.

THE THOROUGHBRED STALLION



WHEATLEY

WILL STAND THE ENSUING SEASON, ENDING JULY 1ST, 1883, at the Oakland racetrack.

TERMS—$50, payable at the end of the season. Satisfactory arrangements can be made for pasturage near the track for mares from a distance.

PEDIGREE AND DESCRIPTION.

Wheatley is a golden chestnut, 15 hands 3 inches high, and of fine style and appearance, and is by War Dance.
First dam sister to Pryor, by imported Glencoe.
Second dam Gipsy, full sister to Medoc, by American Eclipse.
Third dam Young Maid of the Oaks, by imported Expedition.
Fourth dam Maid of the Oaks, by imported Spread Eagle.
Fifth dam Anette, by imported Shark.
Sixth dam by Rockingham.
Seventh dam by Baylor's Gallant.
Eighth dam by True Whig.
Ninth dam by imported Regulus.
Tenth dam imported Duchess.
Eleventh dam Grisewood's Lady Thigh by Croft's Partner.
Twelfth dam by Greyhound.
Thirteenth dam Sophonisba's dam, by Curwen Bay Barb.
Fourteenth dam D'Arcy's chestnut Arabian.
Fifteenth dam by Whiteshirt.
Sixteenth dam Montague Mare.

War Dance by Lexington.
First dam Reel, by imported Glencoe.
Second dam imported Gallopade, by Catton, the sire of Trustee.
Third dam Camillina, by Camillus.
Fourth dam by Smolensko.
Fifth dam Miss Cannon, by Oroville.
Sixth dam by Weathercock.
Seventh dam Cora, by Matchem.
Eighth dam by Turk.
Ninth dam by Cub.
Tenth dam by Allworthy.
Eleventh dam by Starling.
Twelfth dam by Bloody Buttocks.
Thirteenth dam by Greyhound.
Fourteenth dam Brockelsby Betty, by Curwen's Bay Barb.
Fifteenth dam Mr. Leedes' Hobby Mare, by the Lister Turk.

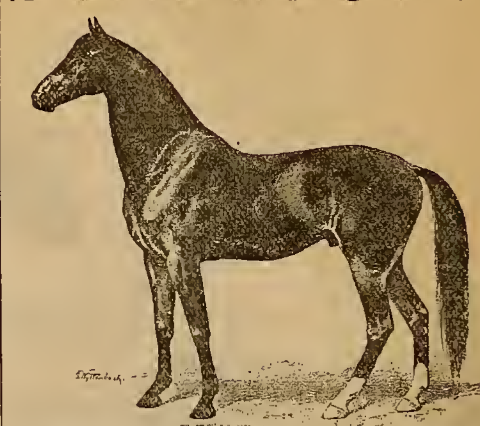
For further particulars apply to

MATT STORNS,
At the Oakland Racetrack,

Or to Jas. B. Chase, 900 Front St., San Francisco.

STALLIONS.

STALLIONS.

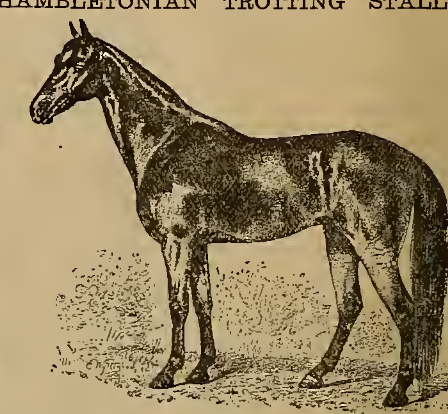


OWNERS OF STALLIONS DESIRING TO PLACE THE MERITS of their stock horses before the breeding public should advertise in the BREEDER AND SPORTSMAN. The fee from one mare will pay the cost of a reasonable advertisement.

Stallion bills printed in first-class style. Call at this office and see samples.

NO. 508 MONTGOMERY ST.

HAMBLETONIAN TROTTING STALLION



BOB MASON

By Echo. His dam Belle Mason by Belmont, Thoroughbred.

Echo by Rysdyk's Hambletonian, his dam Fanny Felter by Magnolia (by American Star). Belle Mason by Belmont (Williamson's); First dam Lucy Johnson by the Pony (son of Imported Leviathan); second dam Catalpa, by Frank; third dam by John Richards.

WILL MAKE THE ENSUING SEASON, LIMITED TO TWENTY mares, commencing February 15, 1883, and ending June 15, 1883, at the stables of his owner, Figueroa street, Los Angeles.

DESCRIPTION.

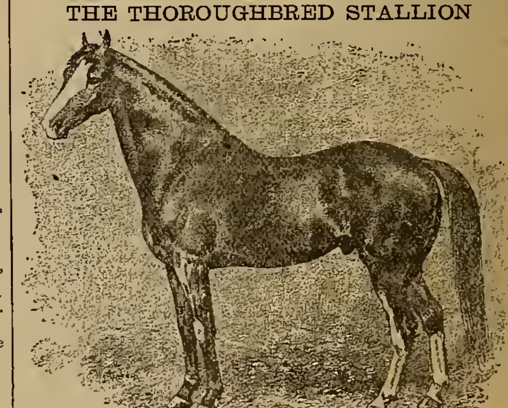
Bob Mason is a mahogany bay, with inside of off hind ankle white and star in forehead; sixteen hands, and weighs 1,100 pounds. Foaled May 10, 1879. He is of fine, kindly disposition, a natural trotter, and has shown great speed, but as yet has no public record. For full history of his sire, Echo, see BREEDER AND SPORTSMAN July 29, 1882. See also, for his full brother, Exile, BREEDER AND SPORTSMAN, issue of September 16, 1882.

TERMS.

One hundred dollars the season, payable at time of service. All mares at risk of owners. Mares not proving in foal can be returned the following season free of charge. Address

CHARLES J. ELLIS,
Post office box 55, Los Angeles, Cal.

THE THOROUGHBRED STALLION



JOE HOOKER,

BY MONDAY.

First Dam Mayflower, by imported Eclipse.
Second dam Hennie Farrow, by imported Shamrock.
Third dam Ida, by imported Belshazzar.
Fourth dam Gamma's dam, by Sir Richard.
Fifth dam by imported Eagle.
Sixth dam Bet Bosley, by Wilkes' Wonder.
Seventh dam by Chanticleer.
Eighth dam by imported Stirling.
Ninth dam by Clodius.
Tenth dam by imported Silver Eye.
Eleventh dam by imported Jolly Roger.
Twelfth dam by Partner.
Thirteenth dam by imported Monkey.
Fourteenth dam imported mare from the stud of Harrison of Brandon.

TERMS—$50 THE SEASON, TO A FEW MARES OF APPROVED breeding. Good pasturage for mares from a distance at $4 per month. Care will be taken to avoid accidents and escapes, but the owner must take the risks.

My place, where Joe Hooker will make the coming season, is five miles from Sacramento on the Freeport road.

This young stallion has proved to be one of the most successful racing sires, and every one of his colts that has been trained can run fast. Among them are Fred Collier and Jim Renwick. For history of Joe Hooker see BREEDER AND SPORTSMAN Jan 20, 1883.

THE

SOUTHERN PACIFIC R. R. CO.

RESPECTFULLY CALLS ATTENTION TO THE

SUPERIOR FACILITIES

AFFORDED BY THEIR LINE FOR REACHING with speed and comfort the best places in the State for

Sea Bathing, Shooting and Fishing.

TRAINS LEAVE SAN FRANCISCO DAILY FOR

MONTEREY,

THE MOST CHARMING

Summer and Winter Resort of the Pacific Coast,

with its beautiful Groves and delightful Drives. Trout in abundance can be obtained from the several streams in the vicinity of Monterey, and the best shooting may be had in season.

THE BAY OF MONTEREY

Is noted for the extent and variety of fish which abound in its waters, notably Salmon, Rock Cod, Barracuda, Pompino, Spanish Mackerel, and Flounder. The above-mentioned attractions, in connection with the low rates of fare, rapid transit, and the superior accommodations furnished at the "HOTEL DEL MONTE," have made Monterey a paradise for sportsmen.

THE BATHING ESTABLISHMENT

OF THE

"HOTEL DEL MONTE,"

IS UNSURPASSED.

A SPACIOUS SWIMMING TANK

(150 x 50 feet)

FOR WARM SALT WATER, PLUNGE AND SWIMMING BATHS.

ELEGANT ROOMS

For Individual Baths with DOUCHE and SHOWER facilities.

MAGNIFICENT BEACH

Of pure white sand for SURF BATHING, Etc., Etc.

THE FAVORITE ROUTE to those well-known Watering Places,

APTOS, SOQUEL AND SANTA CRUZ,

IS VIA THE

Southern Pacific Railroad,

(Broad Gauge), and the

SANTA CRUZ RAILROAD.

☞ At PAJARO, the SANTA CRUZ R. R. connects daily with Trains of the S. P. R. R.

The S. P. R. R. runs through the countiea of San Mateo, Santa Clara, San Benito, Santa Cruz and Monterey, in each of which game abounds in great variety. Notably

Quail, Pigeon, Snipe, Duck, Geese, Deer and Bear.

Lakes PILARCITOS and SAN ANDREAS are reached by this line. Stages connect with trains daily at San Mateo for those well-known Retreats, PURISIMA, SAN GREGORIO and PESCADERO. We would particularly call attention to the unlimited extent of range at and about SAN BRUNO and McMAHON'S for RIFLE PRACTICE.

These resorts are but a short distance from San Francisco and offer special inducements to the lovers of this manly sport.

SPECIAL NOTICE.

Sportsmen and others presenting Passage Tickets o any description issued by this Company will be entitled to

FREE TRANSPORTATION OF THEIR DOGS

when carried in Baggage Cars and put in charge of Train Baggagemen. Train Baggagemen are instructed to issue CHECKS for all dogs received in Baggage Cars.

☞ In order to guard against accidents to Dogs while in transit, it is necessary that they be provided with COLLAR AND CHAIN. Guns and Fishing Tackle checked and carried free of charge. Guns taken apart and securely packed in wood or leather cases may be taken in Passenger Cars.

TICKET OFFICES.—Passenger Depot, Townsend street, and No. 2 New Montgomery street, Palace Hotel.

MEDICAL.

I CURE FITS!

When I say cure I do not mean merely to stop them for a time and then have them return again, I mean a radical cure. I have made the disease of FITS, EPILEPSY or FALLING SICKNESS a life-long study. I warrant my remedy to cure the worst cases. Because others have failed is no reason for not now receiving a cure. Send at once for a treatise and a Free Bottle of my infallible remedy. Give Express and Post Office. It costs you nothing for a trial, and I will cure you. Address Dr. H. G. ROOT, 183 Pearl St., New York.

CONSUMPTION.

I have a positive remedy for the above disease; by its use thousands of cases of the worst kind and of long standing have been cured. Indeed, so strong is my faith in its efficacy, that I will send TWO BOTTLES FREE, together with a VALUABLE TREATISE on this disease, to any sufferer. Give Express & P. O. address. DR. T. A. SLOCUM, 181 Pearl St., N. Y.

ADVERTISE NOW IN THE BREEDER AND SPORTSMAN

FOR SALE.

ENGLISH SETTERS.

BRACE OF THOROUGHbred setters, well broke, for sale. apply to
E. LEAVESLEY,
Gilroy.

FOR SALE.

THE WELL-KNOWN TROTting mare Nellie Grant, by Fred Low, from old Lady Grant, of Whip, Morgan and Copperbottom stock. Nellie Grant is black without white, sixteen hands one inch high, of fine form, and free from hereditary defects. She was a very fast trotter but incapacitated from track work owing to an accident. From her breeding, form and speed she should prove a very valuable broodmare. Apply to
JOHN HOWES,
504 and 506 Sansome street, San Francisco.

FOR SALE.

A VERY FINE HAMBLETOnian stallion, imported from Syracuse, N. Y.; nine years old; mahogany bay; sixteen hands high; perfectly sound; well broken; very stylish; cost over $1,500; property of a banker; full papers; got by Hambletonian Prince, he by Volunteer. Can be seen at Club Stables.

FOR SALE.

NUTWOOD FILLY, FOALED May 7, 1879.
First dam Belle, by Abdallah, by Rysdyk's Hambletonian.
Second dam Kate Crockett, by Langford.
Third dam by American Boy.
Will also sell the dam. Apply to
R. SYER, San Jose.

THIS HOUSE IS A NEW BRICK BUILDING, newly furnished throughout, and with all modern improvements. Table first class. Everything neat, clean and comfortable. Public patronage respectfully solicited. Street cars pass the house every five minutes

RACES.

Spring Race Meeting.

PACIFIC COAST
Blood Horse Association

First Day Regular Meeting—Saturday, April 21.

No 1—California Stake; for two-year-olds; dash of half a mile; closed with thirty-two nominations.

No. 2—Hearst Stake; free for all; $25 each, $10 forfeit, $125 added; second to save stake; dash of three-quarters of a mile.

No. 3—Winters' Stake; for three-year-olds; dash of a mile and a half; closed with twenty-eight nominations.

No. 4—Hurdle race; purse of $150, of which $25 to second horse; entrance free; a dash of a mile and a quarter over five hurdles.

Extra Day—Wednesday, April 25.

No. 5—Purse $150, of which $25 to second horse; entrance free; for two-year-old fillies; dash of five-eighths of a mile.

No. 6—Purse $200, of which $50 to second horse; entrance free; for maiden three-year-olds; dash of a mile and an eighth.

No. 7—Purse $200, of which $50 to second horse; entrance free; free for all; dash of a mile.

No. 8—Selling race; purse $175, of which $25 to second horse; entrance free; dash of one and an eighth miles; horses entered to be sold for $1,000 to carry their entitled weight; two lbs. allowed for each $100 under that valuation; horses entered for over $1,000 to carry three lbs. over entitled weight for each $100 above that valuation.

Second Day Regular Meeting—Saturday, April 28.

No. 9—Purse $150, of which $25 to second horse; entrance free; for two-year-old colts; dash of five-eighths of a mile.

No. 10—Handicap Stake; for three-year-olds; $25 entrance, $10 declaration; $200 added; $50 to second horse; third to save stake; dash of one and three-eighths miles; weights to be announced Thursday, April 26, at 8 p. m.; declaration to be made Friday, April 27, at 12 m.

No. 11—Pacific Cup; handicap of $50 each; $20 declaration; $500 added; second to receive $150; third to save stake; two and a quarter miles; weights announced April 21; declaration April 25, at 3 p. m.

No. 12—Hurdle race; purse $150, of which $25 to second horse; entrance free; dash of a mile and a half over six hurdles.

Second Extra Day—Wednesday, May 2.

No. 13—Purse $150, of which $25 to second horse; entrance free; for two-year-olds; winners at this meeting excluded; horses running second, five lbs. extra; dash of five-eighths of a mile.

No. 14—Handicap Stake; free for all; $25 entrance; $10 declaration; $200 added; $50 to second, third to save stake; dash of one and a quarter miles; weights to be announced Monday, April 30, at 8 p. m.; declaration Tuesday, May 1, at 12 m.

No. 15—Selling race; purse $175, of which $25 to second horse; entrance free; dash of one and a quarter miles; conditions same as No. 8.

No. 16—Handicap Stake; for three-year-olds; $25 entrance; $10 declaration; $200 added; second to save stake; three-quarters of a mile and repeat; weights announced and declaration made same as No. 14.

Third Day Regular Meeting—Saturday, May 5.

No. 17—Gano Stake; for two-year-olds; dash of three-quarters of a mile; closed with thirty-two nominations.

No. 18—Spirit of the Times Stake; for three-year-olds; dash of one and three-quarters miles; closed with twenty-eight nominations.

No. 19—Purse $250, of which $50 to second horse; entrance free; for all ages; dash of two miles.

No. 20—Hurdle race; purse $200, of which $50 to second horse; entrance free; mile and repeat over four hurdles.

Entries to stakes and purses not marked closed, will close March 1, 1883.

Races to close will be run under weights adopted at annual meeting, 1881.

Starters in all races must be named at 6 p. m. the day preceding race, any other rule to the contrary notwithstanding.

Non-members will be placed on the same footing as members of the association in regard to the payment of purses and stakes advertised, and should there be a deficiency the winners will receive a pro-rata division.

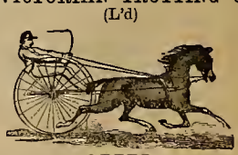
Parties making nominations will be required to record colors at time of making entries, and after record will not be allowed to ride in other colors. This rule will be strictly enforced.

All nominations in stakes and entries in purses must be made on or before the first day of March next, 1883, directed to C. M. Chase, Assistant Secretary, Box 1961, P. O., San Francisco. To be valid they must be plainly postmarked on that day—March 1.

THEO. WINTERS, President,
JOS. CAIRN SIMPSON, Secretary.
C. M. CHASE, Assistant Secretary.

THE VICTORIAN TROTTING CLUB,
(L'd)

MELBOURNE, AUSTRALIA.



MELBOURNE, AUSTRALIA.

—OFFER—

The undermentioned Prize, to be competed for on a day to be named in March next:

PRIZE OF 2,500 DOLLARS,

With Entrance Fees and Sweepstakes of $50 each from Starters added.
Mile heats; best three in five.
Open to all comers, bar geldings.
Winner to receive $2,500; second, two-thirds of Sweep and Entrance Fees, and third, one-third. Entrance 5 per cent.
The Victorian Trotting Club holds membership in the National Trotting Assocation of the United States, under which Rules the races will be governed.
Any further information desired can be obtained by addressing R. J. GIBNEY, Secretary,
Kirk Bazaar, Melbourne.

FREE CIRCULARS OF FEMALE PHOTOS, hooks, cards, etc. Samples, 10c.

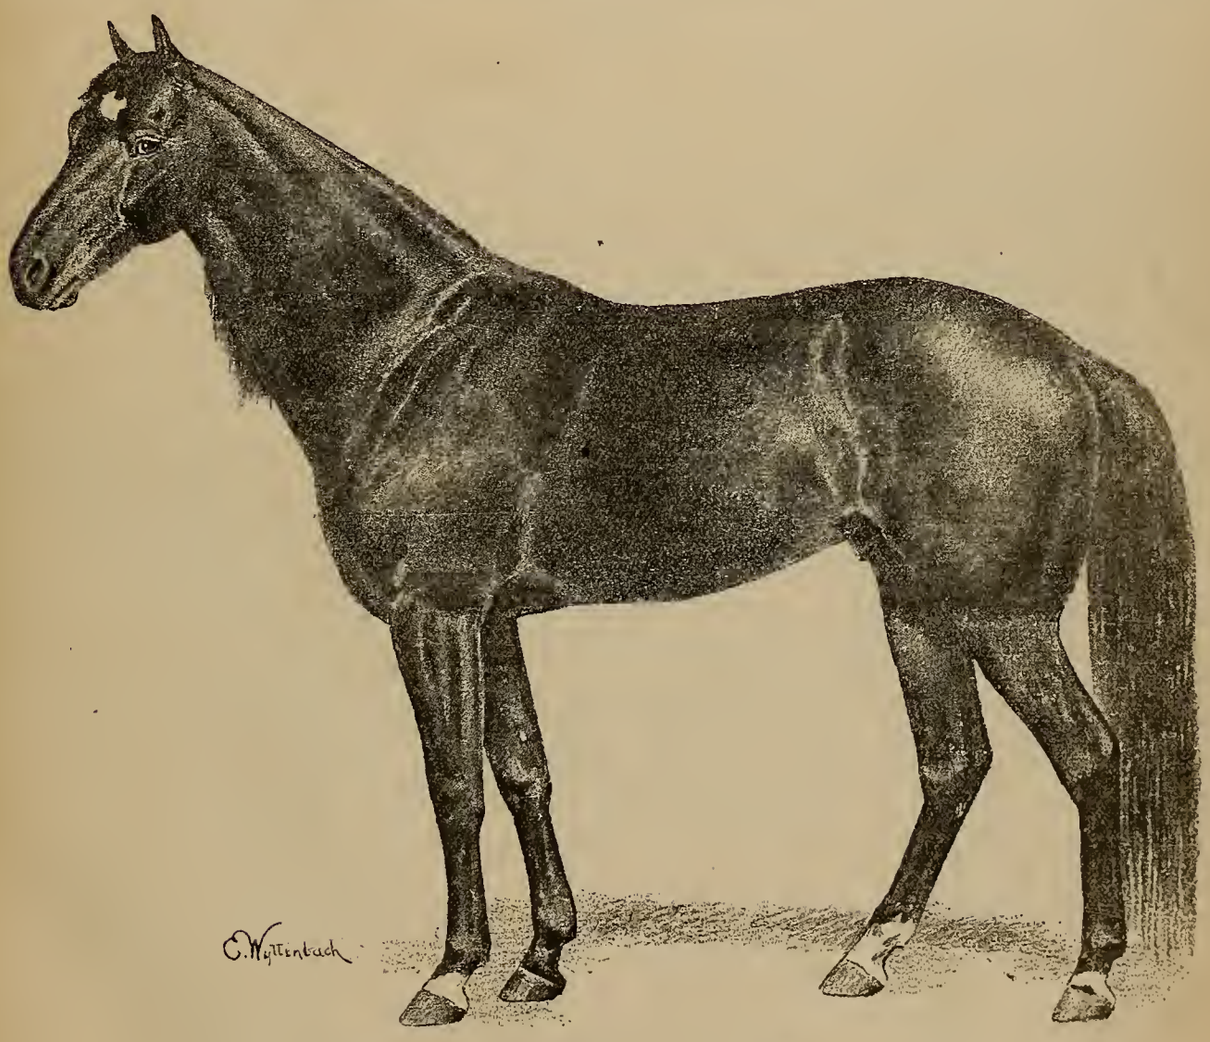
Vol. II. No. 7.
NO 508 MONTGOMERY STREET.

SAN FRANCISCO, SATURDAY, FEBRUARY 17, 1883.

SUBSCRIPTION
FIVE DOLLARS A YEAR.



SINGLETON. Owned by J. T. McIntosh, Chico, Cal.

Prohahly the rarest of any of the noted trotting families in California is that which is of kin to the Blue Bulls. Ahout all, if not eutirely eo, of the strain ie those which Dr. Hicks hronght here. In the desire to ohtain the beet strains of the Eaet and the large eums that have been paid for representatives of the desired lines of hlood, it ie rather a remarkable circumstance that the pride of hoosierdom should have heen overlooked.

Thie may have arisen from an idea that the breeding was unfashionahle, or, perhaps, the etigma which was promnlgated several years ago had something to do with the lack of appreciation. It is certain, however, that if Wilson's Blue Bull had helonged to one of the purple clans the puhlic would have recognized hie claime sooner; as it stands every inch of ground had to be stubhornly battled for, and even now with the second position ae the progenitor of trotters with records of 2:30] or better the praise is grudgingly bestowed.

Twenty-eeven to hie eredit with records ranging from 2:19½ to the other limit ie a grand ehowing, and this without much aid in the maternal line from the recognized chief eourcee of trotting merit. Grand as the display is we have heard that scarcely any effort was made to increaee the number, hy anything like a steady eyetem of trainiug.

As stated to us a Blue Bull would be unhitched from the plow or farm wagon, and put on the course. If, after a short trial, it did uot come up to the expectatione, and theee predicated on what some othere of the trihe had done, viz., ehowing an ahility to trot very fast with a few weeke' handling, it was relegated to menial duties. Even at the low prices for training that ruled in Indiana the expense of an entire season's handling was not to be thought of, and if there was not a decided aptitude to acquire the fast trotting step the schooling was hrought to a suddeu termination. A few monthe' time and heavy toe-weights were deemed ample to make a Blue Bull perfect in the art of faet work at a diagonal motiou, and if uot they were pronounced dullards with whom there was no use to proceed.

Amoug the firet of the Blue Bulls to appear outside of Indiana was Purity, a mare which the late Mr. Wallace was said to have paid $20,000 for. Her record was 2:30 though she had speed enough to have gone very many seconds faster. We were driving in company with her at Buffalo when she fell dead, and cautioned her driver in time to have saved her, had she heen stopped. We were driviug Clara G, a mare of great speed, when Purity came alongside at the half-mile pole. She was pulling hard after having gone to a break, and there was the ominous strangliug sob which indicated too eurely that the lungs were becoming engorged. Had the pull heen elackened and the mare allowed to gallop ou a elack rein she might have recovered, but her driver was too intent on keeping her on her feet, and just as she was rounding into the homestretch she fell, dead almost [illegible] stant her head struck the grouud. This wae in '87

little was known of the Blue Bulls, but every year has seen accessions to the ranks.

The subject of this sketch, Singleton, is connected with the Blue Bulls through his dam, Lightfoot, who was by Flaxtail, by Pruden's Blue Bull, the sire of the hero of Indiana. He brings in the royal trotting blood through his sire Willie Schepper, a son of the "hero of Chester." So much has appeared in the BREEDER AND SPORTSMAN in relation to the Hambletonians that it is unnecessary to go over the ground again, especially when every fair-minded man must concede the place which they occupy in the trotting records is the highest there is. Being a grandson, Singleton has a good share of this victorious blood, and the other portion is such as to warrant high expectations of his success as a breeder. There can be no stationary point in the breeding of horses. There must be progress or else there is danger of retrogression, and as all breeders are aware there must be a judicious mingling of elements to insure success. In-breeding is without question in our mind the best way of intensifying family characteristics and so long as the animals are free from defects the practice can be continued with safety. But there is a limit to in-breeding and then an important question is, what is a good out-cross? Singleton is an example of out-crossing on several different lines of blood, although there is a union of two pacing families.

His pedigree stands thus:

Singleton, brown colt, foaled 1878; bred by Dr. M. W. Hicks. By Willie Schepper, his dam Lightfoot (dam of Pride) by Flaxtail, second dam Fannie Fern by Irwin's Tuckahoe, third dam by Leffler's Consul.

Willie Schepper, by Rysdyk's Hambletonian, his dam Nellie by a son of Vermont Black Hawk, grandam by Busiris, a thoroughbred son of American Eclipse. As has been stated before, Flaxtail was by Pruden's Blue Bull, her dam by Irwin's Tuckahoe, grandsire of Smuggler and a descendant of imported Diomed.

There are so many illustrations of the value of the union of the Hambletonian and Vermont Black Hawk blood that there are few breeders who are not cognizant of the fact, and the latter strain is of the foremost celebrity and seems to mingle kindly with all others. The backing of American Eclipse blood is a good element, and very many of the crack trotters have an infusion of that of the greatest horse of his day, and who never suffered defeat. The union of the two branches of pacing blood in the dam of Singleton has proved in her case and also her sister's, Tinsley Maid, to be a valuable inheritance. As the dam of Pride, with a yearling record of 2:44½ and a two-year-old of 2:33½, and that done so easily that she only jogged for the last furlong, she would be worthy of high renown, but as Singleton trotted a quarter of a mile in 41 seconds when a yearling, driven by a man weighing two hundred pounds, it would appear as though the son only required training to equal the exploits of the daughter. Then the sire of Pride is Buccaneer, and his dam was Tinsley Maid, sister to her dam, so that there was very close inbreeding to the pacing strains. That this has not been followed by deterioration is shown by the form as well as the performances, as Pride is remarkably powerful for a filly of her age.

That the dam has fully as great an influence on the progeny as the sire is now conceded by the most intelligent breeders of trotters. This has long been recognized in the production of racehorses, though forty years ago the impression was general that the breeding of trotters was a sort of haphazard business depending more upon chance than proper selection of the parents. Both being of equal pedigree, having the same physical development and mental temperament, in all probability the dam has the greatest share in moulding the characteristics of the progeny, though as a rule the sire more frequently impresses his form on the offspring.

Volumes have been published on these intricate questions, and the positions taken supported on either side by testimony establishing the views promulgated. The safest plan is to see that on all sides there is merit, and in making choice of procreative animals look to all branches.

We never could comprehend why there was a disposition to regard pacing blood as plebean. By long odds the best and fastest at this gait have descended from the blood-horse, and though some pacers exhibit a formation at variance with symmetrical proportion others are of very high form. It is doubtful if there ever has been a faster or better pacer than Pocahontas.

All of her known blood was that of the thoroughbred, and in close descent from pure sources. Owing to the violent animosity to the blood of the racehorse, pedigrees have been questioned which were undoubtedly correct, and misled by the clamor of interested parties, men who did not share in the prejudices followed in believing the most perverse and malignant falsehoods.

As to the angular quarters, slab sides and narrow chest being peculiar to pacers, this conformation is found in great numbers of horses which are outside of the pacing families. In this State, Nimrod, Jim Brown, Lady St. Clair, Dan Rice, Longfellow, were more than ordinarily "well put up," and the three last named had very much of the appearance of high class racehorses. That the "pacing element" is a valuable mixture in a trotting pedigree is too well established to require extended comments. But the value almost invariably follows those lines that have descended from the thoroughbred, or, as in the case of Pilot Jr., when there has been such an admixture of the higher strains as to obliterate the characteristics of the "Kanuck" so completely that scarcely a trace is left.

Notwithstanding that there were prejudices against the selection for pacers to place in the trotting stud, there were those who fully recognized the merits of the blood a long time ago, when compared with the date when the breeding of trotters was entered into with any sort of systematic arrangements. Twenty-six years ago, perhaps a year earlier, Pocahontas was purchased for the express purpose of breeding trotters from her, and it would be a queerly constituted quibbler who did not acknowledge that the move had been crowned with success. She had a colt in 1854, Tom Rolf, who was a trotter himself and sire of Lady Rolf, with a record of 2:24¼. In 1859 Mr. Bonner's Pocahontas was foaled, and it is stated that he paid a larger price for her than any horse he has bought. Her record of 2:26¼ was far below what she could show. In 1871 we saw John Murphy ride her on the Fleetwood track. She made a mile in 2:18, and on the repeat she went to the half-mile pole three seconds faster, but when going apparently well within her rate she made one of those saddle horse breaks, diddling up and down as though she would never regain her trot, and still she completed the mile in 2:20. That was when that track was surely four seconds slower than the fast courses of the present day, and we thought at the same time she could have compassed it in 2:15.

Another of the old mare's daughters, May Day, is the dam of Nancy, record 2:23½, and another son, Strideaway, is the sire of Pratt (2:28). Thus, from Pugh's Aratus, Ethan Allen, and others of the Vermont Black Hawk blood, she has proved that a highly bred pacing mare had an appropriate place in a trotting stud.

While it may be difficult to prove the lineage of the Blue Bulls, there is scarcely a question that their descent was from the sort which Fanny Kemble declared to be the only ones "who did it right well." Those of the breed we have seen have shown the best possible proof in the absence of attested pedigrees, viz., a form "approximating to that of the thoroughbred" and performances in keeping with the form. The Tuckahoes descend from imported Diomed, and those of the strain of Pocohontas and Smuggler from American Eclipse.

The combination of Rysdyk's Hambletonian and the families on the maternal sides of Willie Schepper and his son Singleton can hardly fail to be a valuable acquisition to the trotting strains of California, and is another illustration of how rich this coast is in the most desirable strains of the East.

Our artist leaves little to say in relation to the form of the animals represented, though in this instance the merit is shared by an artist who made the first sketch of the horse. We have forgotten his name, having mislaid the slip on which it was written, and from taking the precaution to put it in writing memory fails to reproduce it. Everyone who is acquainted with Singleton pronounces it an admirable likeness. He is fully 15¾ hands and weighs 1,100 pounds. He is a dark brown, with tan-colored flank, and back of the elbow of the same lighter shade. We have long admired this color, more ardently, perhaps, from old Blackbird being of that shade, and in a large majority of those we have known there was an extra amount of endurance. There is a star ornamenting a very handsome head and one hind foot white. He is built on the "lengthy" model, his neck and body being longer than is usually seen, though he is very muscular, as the weight indicates. He is wide between the jaws, the windpipe large and detached from the neck. Altogether he is a very handsome specimen of the American trotter, and with action corresponding to his appearance.

The average legislator knows no more about the habits of fishes and game (game that flies or walks) than he does of the condition of affairs in the moon; but you generally find him on the side of the poacher and in favor of the largest liberty in the taking of game and fishes. Some persons seem to forget, if they ever knew, the fact that the inhabitants of the land and water cannot increase if they are killed during the breeding and spawning seasons; and this is exactly the result of the poachers' greed. They, like the destroyer, death, "have all seasons for their own," and it is to restrain their evil propensities that wise and humane men introduce game and fish bills in legislative bodies and urge their enactment. Game cannot be too well protected at any time, so great is the desire among men to slay merely for the sake of temporary sport, and the Legislature should readily adopt suggestions on this point from those who are not afflicted with the greediness of the average pot-hunter, but who desire to see the denizens of the streams and forests protected in order that generations to come may not be deprived of the pleasures to be found by brook and field. The present Legislature is expected to do something in the way of providing for game protection that will not be a dead-letter on the statute books.—*Sacramento Bee.*

At a private inspection in London a few days since of the building in which the International Fisheries Exhibition is to be held, the Chairman of the Executive Committee said that it was expected the exhibition would be a brilliant success. Every foot of space in the building would be filled. The last accession was that of Russia, which for some time had held aloof, but now asked for 10,000 feet of space. The Queen has promised if her engagements permit to open the exhibition on May 1.

A mule with an interesting history was raffled for in New York one day last week. The animal, it is alleged, was at one time owned by General Scott's father, and did service in the war of 1812. It is not known that he served in the Mexican war, but when the rebellion broke out the animal was sold at Washington to the Government.

The Coney Island Jockey Club announce that the four-year-old colt, Joe Murray, by Rebel, dam Mary Anderson, was entered both for the Coney Island Cup and the Coney Island Stakes, but that the letter that was postmarked Gonzales, Tex., having been misdirected, it has only recently been received by the Secretary.

A representative Canadian lacrosse team, picked from Montreal, Quebec, Toronto and Winnipeg clubs, will go to England in May next on a tour through the United Kingdom. A party of Indians will accompany them.

There are some 40,000 sheep in Washoe county, Nevada.

OUR NEW YORK LETTER.

Causes of the Louisiana Postponement—General Sporting Notes—Ensilage—Etc.

EDITOR BREEDER AND SPORTSMAN: After the repeated postponements, during the last six weeks, of the Engeman racing season at the Crescent City, no one was greatly astonished at the final announcement from New Orleans of the abandonment of the venture for the present. All accounts of matters occurring there since the second postponement pointed this way, for although they had horses enough on the spot the weather has been so bad during the last month as to preclude any idea of getting the horses in condition to race until after the carnival season probably, when a large portion of Orleans' floating population would have left for their homes, rendering the pecuniary failure of the enterprise a denouement almost certain to follow. Another winter the "beach combers" from Brighton's sad sea waves will doubtless manage differently and take heed to it that they have a greater number of horses to start south with—horses that shall be in fairly good condition—instead of taking down with them, as was the case with the lot sent from here in December last, a comparative handful of cripples, or, at best, animals so used up by an exhaustive fall campaign as to be incapacitated for an immediate renewal of their turf labors. A member of the "beach brigade," just arrived thence, reports that before it was finally determined to abandon the enterprise for this winter a thorough examination was made of the material they had at hand, and this disclosed the gloomy fact that less that twenty per cent. of the horses were fit to race, or, in other words, out of about one hundred horses on the track only eighteen were in a condition to be considered "able bodied" and ready for business. There will probably be a few days' racing there, however, given under the auspices of the Louisiana Jockey Club prior to their initial spring meeting in March next, the initial day of which was brought off on Saturday last, when three races were run at five, six and nine furlongs respectively, the winners being Lute Fogle (4) by Enquirer, Turin (6) by War Dance, and Wedding Day (5) by Dudley. The latter is a full brother to the well-known gelding Fair Count, one of the longest horses in training and a noted good one when right, and not too heavily weighted. Five thousand dollars was offered and refused for Fair Count last season after his great race for the Stirrup Cup, two miles and a furlong, at Sheepshead, in which he defeated Eole and a strong field in a very fast run race. His pilot on that occasion was Donahue, who is said to have "laid away," as the results of his services to the Snedeker confederacy and others during 1882, nearly $40,000, of which $18,000 was contributed by the inevitable Walton. If this popular pigskin artist be as wise as he is fortunate, another year like the last will see him riding no more or at least not at the withering low weights in vogue, by which he and others are continually tempting fate, like poor Barrett did to his sorrow. In my last I credited George Evans with a re-engagement this year to the Philadelphia stable of Mr. Kelso.

This is a mistake, for George has signed papers with W. O. Bernard, formerly of the old McDaniel confederacy, and is now in Kentucky selecting a stable of racers for his new employer, giving the preference to the young Springboks, of whom Chipsetta was last spring a bright and shining light, until death cut short what promised to be a brilliant turf career.

Bernard was half owner of Springbok in his racing career, which in part explains his decided leaning toward the progeny of the big chestnut son of Australian and Hester, whose Saratoga Cup of 1875 will live long in turf annals. Mr. Kelso, however, will have one of the foremost trainers in John Nuggins, the Texan owner of Incommode, Jack Hardy, Ella Rowett and others, and late trainer of the great Bend Or. His ordering of the last named, and the rest of Churchill and Johnson's stables in 1882, showed him the equal of the best trainers in the land, and as he will have as jockey young O'Leary, a graduate of the Islip stable, the Kelso lot should be in the front of the turf battles of '83.

The recent marriage of Mr. Geo. Lorillard in Florida, the land of flowers, has given rise to some conjectures as to whether the famous "blue and orange sleeves" will still be seen on the turf. Whether or not the gentleman means to retire is best known to himself and his fair lady, but it goes without saying that should dame Rumor have spoken the truth, the "noble sport of kings" will lose one of its foremost and best-known supporters. Mr. Lorillard's horses have always had the reputation of being "meant" each and every time they ran, something which can hardly be said of those of his shrewd brother, P. L., some of whose devious ways have been at times past finding out.

The powerful new Erie stable of W. S. Scott Esq. has Byron McClellan to train its aspirants for turf honors. Just who will ride is not yet decided.

At Monmouth Park Lewis Stewart has twenty odd undergoing their tutelage for Applehy & Johnson, the bookmakers. Forester, the Withers, Belmont and Tidal winner of 1882, has been patched up again and will be trained, as also will his old antagonist, Runnymede, who is in different hands, however. Tony Taylor, at the same place, has a long string of J. E. Kelly's horses, and under the old tutor of Tom Ochiltree they should be far advanced when the racing begins.

Spring Station, Ky., had a dusky wedding a few days since, one of the contracting parties being the best colored jockey in the world, Isaac Murphy, the "black Englishman." Checkmate and Murphy are inseparable names during the last few years, and while some would say the horse made the boy's fame others would say the boy made the old brown gelding famous. Be that as it may, the record shows that under the new "Benedick's" pilotage the "welter" horse made his greatest performances and the defeats oftener came when Murphy was not in the saddle. Success to him in his new departure.

The Chicago and St. Louis entries to the spring stakes were made public some time after those at Louisville which closed two weeks before the others. The latter club, however, always seems to care little about the rest of the turf world at large learning at once their future entries for any season. At Chicago as at Sheepshead, Mr. Baldwin and other Californians have made large entries, showing that the Eastern stables will have as last year several "lions in the path," from the far off Pacific Coast. This is as it should be, and lends additional zest to the sport, for one-half its popularity with the masses consists in its glorious uncertainty. Betting has also begun, not exactly in earnest, for it is very early yet, and the horses have done no work through enforced confinement, but at Louisville Messrs. Watts, Hughes and Cathcart have opened their books on the Kentucky Derby, Cup, Merchants', etc., and here several bets have been made on the Withers at Jerome for which there is already a great rivalry existing between the Dwyers' Bonnie Scotland colt, Geo. Kenny, and the imported Pizzaro, the sire of Adventurer. The Rancocas colt

hae a trifle the most friende perhaps, and on him coupled with Jacobue, heby the Ill-Used (belonging to J. E. Kelly), an even bet of $1,000 was made here a few days ago against Kenny and Barnes, the latter by Billet and also in tbe Dwyers' stable. Three hundred dollars to $100 was also laid against the Brooklyn lot (Kenny, Barnes and Joe Blackburn) for tbe same race and so the market odds become somewhat estahlished although the regular betting books will not open for some weeks yet. For the first time in several years the Brooklyn stable has failed to make its annual spring entries for the Louisville meeting. They, the Dwyers, claim that the early sending along of their horses, necessary to fit them for racing early in May, has proved in the past prejudicial to their interests late in the seasou, and point to the couspicuous examples of Hindoo and Runnymede. Notwitbstanding this fact the 1st of May or thereabouts will probably see their colt Barnes and filly Miss Woodford, the latter also a Billet, on the way to Kentucky, whatever may be their intentions regarding the others in their stable. The two named are engaged in most of the three-year-old stakes in the West, that closed in '81 and '82, and the Dwyers having, harring accidents, a lien 'on a good share of them, are not going to throw away "a bird in the haud for two in the hush." So appear to think the bettors in Kentucky for in spite of the apparent determination of the Dwyers not to race West this spring, their colt Barnes is second choice for the Kentucky Derby, and Miss Woodford as good a favorite as any of her sex for the Kentucky Oaks and other filly races.

Perhaps the appearance, however, of a new Eastern stable in Kentucky this spring, has something to do with the Dwyers' possihle failure to he at the Falls City in May. I refer to the Saratoga stahle of Mr. Charles Reed. This gentleman, last fall, purchased a fine stock farm near Nashville, Tenn., and removed there his stallions, broodmares, young stock and racers, including among the latter Thora, the famons daughter of Longfellow and Susan Ann. He has entered largely for the spring events iu Kentucky and will, douhtless, have something to say regarding their disposal. So whether the Brooklyn boys have any horses there or not, New York State will he worthily represented on the "dark and bloody ground" in May next, and if the great mare named above has recovered her loss of form last summer, she must prove a formidable rival for the Kentuckians. They appear to think the same thing also at Louisville, for Watts & Co. have made her the favorite in their betting hooks for the Cup, Merchants' and Turf stakes, in all of which she will meet the "creme de la creme" of the Western training lists.

Pat Maney, Mr. Reed's cross country jockey, is still at Saratoga but will go to Tennessee in March, I believe, and Brophy will as before ride the Meadow-Brook flat racers.

A great "pigeon shoot" will take place at Lonisville the middle of February. Bogardus and Dr. Carver will then have another try at each other, and opinions are ahout equally divided here as to the probable resnlt. If anything, Bogardus has the call, but at very slight odde, for hetween these two great marksmen it is "six of one and half a dozen of the other."

Following the example of your townsman Leland Stanford, a few weeks later will see W. H. Vanderhilt and family in your State for a prolonged visit. The Governor has, I see, through his agents pnrchased Martin Fisher's imported stallion Young Prince. Surely Palo Alto will if it keeps on at its present rate he not only the foremost establishment of the kind in America, but in the world as well, for it is douhtful if there is at present much more capital invested in horse flesh at the breeding farm of any one individual in either Eu rope or Australia than there is on the snnny slopes of Stanford's peerless place.

Ensilage, the pressure system of saving crops for fodder, is receiving considerahle attention here. At a meeting of the congress held in this city last week Mr. Francis Morris, the breeder of your famous stallion Monday, presided, and the application of the system to corn, rye, grass, sorghum, etc., was warmly discussed and unanimously approved. Compressed clover, howeyer, it was found, turns black and gets musty from keeping, an experience in which more than one member concurred. A plan was prepared for a permaneut organization, and with this the meeting adjourned, subject to the call of the chairman.

E. S. Stokes has bought the lease of the old site of the hurned Park Theater. He is to pay a rental of $20,000, and may erect another theater, thongh this is hy uo means certain. The theatrical season is at its height here at present. At Gen. McCaull's two places of amusement, the Bijou and the Casino (the handsomest theater in the city by long odds), "Virginia" and "The Queen's Lace Handkerchief" are running to large business. The same may be said of the Union Square, where a new Parie succeee, "A Parisian Romance," is crowding this well-known Thespian resort to the doors. At Mr. John Stetson'e theaters, Booth's and the Fifth Avenue, the Corsican Brotbers and Miss Mary Anderson are turning away people nightly. At the former house, "Monte Cristo," in which the writer saw the late Mr. Fechter play in San Francisco sixteen yeers ago, ie to be revived ehortly, and it will douhtless score a succese, for it is a very interesting play, with strong situations. Miss Anderson's full repertoire ie heing given by her at the Fifth Avenue, and eince the death of Neilson she is without a rival on the American stage in such parts as Parthenia, Galatea and Juliet. Mr. Daly is to bring out a new play at his theater next week, called "Serge Panine," and at Wallack'e the "Silver King" has merited the unqualified approval of the prese and critics. Your countrywoman, Miss Annie Pixley, is doing her old favorites, "M'Liss" and "Tara," under the Abbey management at the Grand Opera House, and at Haverley's Fourteenth Street Theater "Fritz" has drawn crowds after his old fashion. Emmet is very steady now, and has, it appears, settled down to business. "Iolanthe," at the Standard, "Inflatrai" at the Comique, "Uncle Dan'l" at the Windor, in which Mr. Macauley is as entertaining as ever, "Young Mrs. Winthrop" at the Madieon Square, and the "Black Flag" at Poole & Gilmore'e Nihlo'e Garden, all doing well, make up a list to appease Metropolitan theatergoers, unsurpassed in any city of the world. Yours,

PACIFIC.

New York, Jan. 31, 1883.

Tbe acceptances for many of the spring handicape were published in London on the 31st ult.. and as a whole they were very eatiefactory. For the Lincoln Handicap forty-six were accepted for out of eeventy entries, including Lord Ellesmere's Wallenstein and Mr. P. Lorillard'e Sachem and Aranza. For the City and Suburban fifty were accepted for out of seventy entriee, which include Mr. Keene's Foxhall, Mr. Lorillard's Iroquois, Sachem and Aranza and Lord Rossmore's Paseaic. For the Great Metropolitan there are nineteen acceptances out of thirty-six entries, including Mr. Lorillard's Iroquois.

TURF AND TRACK.

Eastern Turf Announcements for 1883.

During the past week many of the Eastern racing associatione have presented tbeir schedule of stakes and fixed events to he run during the season of 1883 to the attention of owners and of the general public. When the Western associations presented their schedule in December it was seen that every effort was to he made for a brilliaut racing season. The attractious offered have been "seen" by the Eastern associatione and the result is that the National Jockey Club of Washington, the Maryland Jockey Club of Baltimore, the American Jockey Club of New York, together with the Monmouth Park and Saratoga associations, have announced the longest and richest list of stakes ever presented by them. With these and the stakes which have already closed for the Coney Island Jockey Club, a season of unparalleled brilliancy may be expected.

National Jockey Club.

The first on the list is the National Jockey Cluh of Washington, which will lead off the Eastern season with four days' racing at Ivy City, on May 15th, 16th, 17th and 18th, duriug which upwards of $10,000 will he raced for. Although only recently organized, the National Jockey Cluh has every promise of success; its officers are young and energetic, and as the club is somewhat under the wing of the famous Maryland Jockey Club, owners are assured that they will receive all they win, with every other attention possihle. The stakes announced to close March 1st are as follows:

For two-year-olds: Youthful Stakes, at $25 each, play or pay, $500 added, of which $100 to the second; half a mile.

For three-year-olds: Army and Navy Stakes, at $50 each, half forfeit, $800 added, of which $200 to the second; to carry 100 pounds; winning penalties; mile and a quarter.

Analostan Stakes, for those that never won a sweepstakes at two years old, at $50 each; half forfeit, and $600 added, of which $150 to the second; one mile.

For all agee: Washington Cup, a sweepstakes for three-year-olds aud upwards, at $50 each, half forfeit; $1,000 added, of which $200 to the second; three-year-olds, 90 pounds; four-year-olds, 104 pounds; five years and upwards, 112 pounds; two miles and a quarter.

National Handicap, a sweepstakes for all ages, $50 each, half forfeit, $700 added, of which $150 to the second; mile and a furlong.

Diplomatic Stakes, for all ages, at $50 each, half forfeit, $800 added, of which $200 to the second; mile and a half.

Mount Vernon Stakes, for fillies and mares that never won a sweepstakes, at $50 each, half forfeit, $700 added, of which $150 to the second; mile and a quarter.

Selling Sweepstakes, for all ages, at $50 each, half forfeit, $700 added, of which $100 to the second; selling allowances; mile and a furloug.

To the Army and Navy Stakes, the Analostan Stakes, the National Handicap, Diplomatic Stakes, Mount Vernon Stakes and Selling Stakes there is a $10 declaration clause, under which owners may declare ont on May 1st. The weights for the National Handicap will be published April 20th. All nominations and communications should be addressed to the Secretary, H. D. McIntyre, P. O. box 496, Washington, D. C.

Maryland Jockey Club.

The Maryland Jockey Club has fixed upon the anniversary of Washington's Birthday (February 22) as the date for its stakes to close. The meeting will take place as usual during the fonrth week of May. The fixed dates are May 22, 23, 24 and 25, when the usual excellent programme of four and five races each day will be run, including such well-known events as the Home Bred Stakes, the Vestal Stakes and the Preakness Stakes, each for three-year-olds. The evente to close on the 22d are ae follows:

For two-year-olds: Clabaugh Memorial Stakes, a subscription of $100 each, half forfeit, $600 added, of which $200 to the second; to carry 110 pounds with usual allowances; to name though the entry-box the day before the race; half a mile.

For three-year-olds: A sweepstakes for those that have never won a sweepstakes at two years old, at $25 each, play or pay, $500 added, of which $100 to the second; one mile.

For four-year-olds: Peyton Handicap Sweepstakes, at $50 each, half forfeit, $600 added, of which $100 to the second; mile heats.

For all ages: Rancocas Handicap Sweepstakes, at $50 each, half forfeit, $600 added, of which $100 to the second; mile and a furlong.

Baltimore Cup, a sweepstakes, at $50 each, half forfeit, $1,000 added, of which $200 to the second; two miles and a quarter.

The weights for the Rancocas and Peyton handicaps will be annonnced on April 28, declaratione to he made on or before May 12. All communications to the Maryland Jockey Club should be addressed to J. D. Ferguson, Secretary, 58 North Charles street, Baltimore, Md.

American Jockey Club.

Following its custom, the American Jockey Club will hegin its season for the current year on Decoration Day (May 30). The committee, however, makes no announcement of how long the meeting will last, but as it announces five stakes to close March 1, with the Withers, Belmont and Ladies' Stakes already closed, to be run during the meeting, it is safe to say that it will he continued to Saturday, June 9. The stakes announced are as followe and include the well-known spring handicaps which, like the City and Suburban and other events at Epsom, will no doubt afford New Yorkers ample chaucee to speculate to their hearts' content:

For two-year-olds: Juvenile Stakes, at $50 each, half forfeit, $600 added, of which $100 to the second; half a mile.

For all ages: Fordham Handicap Sweepstakes, at $50 each, half forfeit, $500 added, the second to receive $200 out of the stakes; mile and a half.

Great Metropolitan Handicap Sweepstakee, at $100 each, half forfeit; $1,000 added, the second to receive $200 out of the etakes; mile and a quarter.

Jockey Club Handicap Sweepstakes, at $100 each, half forfeit, $1,000 added; the second to receive $200 out of the stakes; two miles.

Westchester Cup, a sweepstakes for all ages, at $50 each, play or pay, with $1,000 added, the second to receive $200 out of the stakes; winner of Baltimore Cup to carry five lbs. extra; two miles and a quarter.

The weights for the eeveral handicape will he published May 1, and the declarations at $10 each for the Fordham, $15 for the Great Metropolitan and $20 for the Jockey Club must be made May 20. Wiuners of one or more races after the publicatiou of the weights are penalized 5, 7 or 10 pounds, while under the new rule adopted by the A. J. C., should the top weight, after the declaratione are made, be lese than 118 pounds, it will be raised to that amount and all the othere in proportion; thus, if the top weight left in is 115 pounds, there will be three pounds added to all that have not declared out. All communicatione for informatiou as to the American Jockey Club aud Jerome Park sbould be addressed to Captain J. H. Coster, Secretary, Madison aveuue and Twenty-eeventh street.

Monmouth Park Association.

Those wbo insisted that racing at Monmoutb Park last season was a failure will be somewhat surprised that the association proves the reverse, for by tbe announcemeut just made there will be three days' racing each week, begining ou Wednesday, July 4, and ending ou Saturday, August 25, makiug a total of twenty-three days' racing, during which no less thau $115,000 will he raced for in added mouey and purses. The programme of fixed events is uearly the same ae last year; those to close ou March 1 are as follows:

For two-year-olds: The Atlantic Stakes; maiden allowancee; six furlougs.

Optioual Stakes; selliug and maiden allowances; six furlongs.

Camden Stakes; special conditions; six furlongs.

Seabright Stakes; winning penalties; non-winning and maiden allowances; six furlongs.

Red Bank Stakes; winning penalties and maiden allowances; six furlongs.

Moet and Chandon Champagne Stakes, at $25 each, play or pay, with $500 added; winniug and maiden allowances; six furlongs.

For three-year-olds: Trenton Stakes; selling allowances; mile and a quarter.

Newark Stakes; winning penalties; non-winning and maiden allowances; one mile.

Barnegat Stakes; winning penalties; non-winning and maiden allowances; mile and a half.

Raritan Stakes, for those not having won a stake of the value of $1,500 at two years old; winningpenalties; non-winniug and maiden allowances; mile and a quarter.

Elizabeth Stakes, for fillies not having won a stake of the value of $1,500 at two years old; winning penalties; non-winning and maiden allowances; mile and a quarter.

Palisade Stakes; winning penalties; non-winning aud maiden allowances; mile and a furlong.

For all ages: Long Branch Handicap, at $50 each, half forfeit, only $10 if declared, with $500 added, the second to receive $100 out of the stakes; mile and a quarter.

Shrewsbury Handicap, at $50 each, half forfeit, only $10 if declared, with $750 added, the second to receive $250 out of the stakes; mile aud three-quarters.

Ocean Stakes, at $50 each, play or pay, with $750 added, the second to receive $300 out of the stakes; mile and a furlong.

Monmouth Cup, a sweepstake at $50 each, play or pay, with $1,000 added, the second to receive $300 out of the stakes; winners of the Baltimore, Westchester or Coney Island cups of 1883 to carry three lbs.; of two of them, five lbs.; of three of them, seven lbs. extra; two miles and a quarter.

Eatentown Stakes, non-winning allowances; one mile.

Freehold Stakes, special weights, with non-winning allowances; mile and a half.

Passaic Stakes, for three-year-olds and upwards; winning penalties and maiden allowances; six furlongs.

Navesink Handicap, at $50 each, half forfeit, only $10 if declared, with $1,000 added, the second to receive $250 out of the stake; mile and a half.

Harvest Handicap, at $50 each, half forfeit, only $10 if declared, with $750 added, the second to receive $200 out of the stakes; mile and a quarter.

Midsummer Handicap, at $50 each, half forfeit, only $10 if declared, with $500 added, the second to receive $150 out of the stake; one mile.

Champion Stakes, at $250 each, half forfeit, with $2,000 added, the second to receive $500 out of the stakes; mile and a half.

In addition to the ahove stakes there is the Hopeful, the July, the Tyro, the Sapliug, the August, the Criterion and the Home Bred Prodnce for two-year-olds, and the Lorillard, the Monmouth Oaks, the Omnibus and the West-End Hotel stakes for three-year-olds, to he run during the meeting. One feature of the stakes run at Monmouth Park is that the eutrance money payahle at the time of closing or subsequently is small and goes to the association, while the main stake—which is only payable by starters—with the added money, $1,500 (less, in nearly all stakes, $500 to the owner of second), goes to the winner. These conditions govern the Atlantic, Optional, Camden, Red Bank and Seabright stakes. For the Eatontown, Freehold and Passaic stakes the entrance is $25 at the time of entry aud $100 to start—the amount in the case of the Passaic being $50—while for the Trenton, Newark, Barnegat, Raritan, Elizaheth, Palisade and Freehold the entrance is $15 if declared out by Juue 15, or $25 for horses left in after that date and are non-starters. For the handicaps the weights will be announced as follows: For the Long Branch, July 2; Shrewsbury, July 5; Navesink, Harvest and Midsummer on July 14, the declarations for each being due the next day or a few day after. From such a bold announcemeut, aud with the improvemeuts contemplated as to the stand, diniug and refreshment-rooms aud betting accommodations, it will he seen that the Monmouth Park Aseociatiation means business. As to the success of the meeting, much will depend on the trausportatiou. There is every promise that the "direct" accommodation will he so in fact and not simply on paper. Certainly it will be to the interest of the association that there shall be as little delay as possible, aud that trains shall run direct from the track to Jersey City, and that boats shall convey the crowd at once to New York and shall not be detained to suit the whim of any surly conductor or brass-bound ferry master. Owners making eutries and those haviug husiuess with the Mouuouth Park Association should address the Secretary, Captain J. H. Coster, at the corner of Madison aveuue and Twenty-seventh street.

The Saratoga Association.

The very popular Saratoga Associatiou also means business, and will uo douht have a big share of the raciug patronage. Secretary Wheatly, with his usual skill, has prepared au excellent list of stakes, to close March 1, aud as that skill ie supported by liberal added money there is but little douht that the racing at Saratoga in 1883 will be all that its admirers wish. The season will begiu on Saturday, July 21, and follow on every fair day (Sundays excepted) until Thursday, August 30.

The stakes announced are briefly as follows:

For two-year-olds: Flash stakes, at $100 each, half forfeit, with $800 added; half a mile.

Spinaway Stakes, for fillies, at $100 each, half forfeit, with $800 added, the second to receive $200 out of the stakes; to carry 100 lb. each; with winning penalties and maiden allowances; five furlongs.

The Virginia Stakes, at $25 each, play or pay, with $700 added, the second to receive $150 and the third [illegible] of

the stakes; non-winning and maiden allowances; five furlongs.

The Tennessec Stakes, at $25 each, play or pay, with $700 added, the second to receive $150 and the third $50 out of the stakes; non-winning allowances; six furlongs.

The Missses' Stakes, for fillies, at $50 cach, half forfeit, with $700 added, the second to receive $200 and the third to receive $75 out of the stakes; to carry 100 lbs.; winning penalties and maiden allowances; six furlongs.

The Equity Stakes, at $25 each, play or pay, with $700 added, of which $100 to the second; colts, 100 lbs.; fillies and geldings, 97 lbs., winning penalties; maiden allowances; six furlongs.

For three-year-olds: Sequel Stekes, at $50 each, half forfeit, with $1,000 added, the second to receive $250 and the third $100 out of the stakes; winning penalties and maiden allowances; mile and five furlongs.

Pocahontas Stakes, for fillies, at $50 eech, half forfeit, with $1,000 added, the second to receive $200 out of the stakes; winniug penalties and maiden allowances; mile and 500 yards.

United States Hotel Stekes, at $50 each, half forfeit, with $1,000 added; the second to receive $300 and the third $100 ont of the stakes; uon-winning allowances; mile and a half.

The Clarendon Hotel Stakes, for fillies, at $25 each, play or pay, with $800 added, the second to receive $200 and the third $50 out of the stakes; non-winning and maiden allowances; mile and a qnarter.

The Relief Stekes, at $50 each, half forfeit, with $1,000 added, of which $250 to the second, the third to receive $100 out of the stakes; colts, 110 lbs.; fillies and geldings, 107 lbs; winning penalties and maiden allowances; mile and five furlongs.

For all ages: Excelsior Stakes, at $50 each, half forfeit, with $1,000 added, the second to receive $250 and the third $100 out of the stakes; mile and a quarter.

Saratoga Cup, a sweepstakes at $50 each, play or pey, with $1,500 added, the second to receive $300 and the third $100 out of the stakes; two miles and a quarter.

Cash Handicap, at $10 each for entries and $15 additional to start, with $800 added, the second to receive $150 and the third $50 ont of the stakes; mile and a furlong.

Summer Handicap, at $50 each, with $1,000 added, the second to receive $200 and the third $75 out of the stakes; mile and a half.

The Welter Stakes, at $25 each, play or pay, with $500 added, the second to receive $100 ont of the stakes; professional riders, 3 lbs. extra; amatenrs never having ridden three or more winners allowed 5 lbs.; one mile.

Grand Prize of Saratoga, a handicap of $50 each, half forfeit, with $1,200 added, the second to receive $250 and the third $100 ont of the stakes; mile and three-qnarters.

Congress Hall Stakes, at $25 each, play or pay, with $800 added, the second to receive $150 and the third $50 out of the stakes; non-winning allowances; heats three-quarters of a mile.

The Morrissey Handicap, at $50 each, half forfeit, with $1,200 added, the second to receive $250 and the third $100 out of the stakes; two miles.

The Baden-Baden Handicap, at $50 each, with $1,800 added, of which $300 to the second; three miles.

Steeplechases: The Trouble Handicap, at $50 each, half forfeit, with $1,000 added, conditionally that three start; the second to receive $200 and the third $50 ont of the stakes; about two miles and a quarter.

North American Handicap, at $50 each, half forfeit, with $1,000 added, conditionally that three start; the second to receive $200 and the third $50 ont of the stakes; about two miles and three-qnarters.

In addition to these stakes the following have already closed: For two-year-olds the Saratoga and Kentucky stakes, each with a large entry, and for three-year-olds, the Travers, Alabama and Kenner stakes. The special conditions for the above stakes, named to close March 1, are very nnmerons. There is a small declaration for the Flash, Spinaway, Grand Prize of Saratoga, and Morrissey and Tronble Steeplechase, which can be made Jnly 2. For the North American Steeplechase the declaration must he made Jnly 15 and for the Summer Handicap July 25. The weights of the several handicaps will he published as follows: Summer Handicap, Jnly 15; Cash Handicap, July 25; Trouhle Steeplechase Handicap, August 1; Grand Prize, August 6; the Morrissey, August 10, and the North American Steeplechase and Baden-Baden, August 20. Mr. Wheatly's address until early in July is Fordham, Station T, New York City—*New York World*.

Racing Statistics for 1882.

The increasing prosperity of the turf in all sectious of the country ie shown by the following comparison between the gross winnings and the numher of races ruu in 1876 and 1882. The grose winnings in 1876 of all horses, with or without known pedigreee, amounted to $485,509, while the total for 1882 amounted to $1,146,121 75, the calculations for hoth years heing made on the same basis for "Krik's Guide to the Turf." In 1881 the total was $987,248 75; of that amouut $162,479 25 was won abroad, principally in England, hut during the paet year no euch success was had abroad, only $50,850 being won. Thie, added to the $14,805 won in Canada, leaves a balance of $1,078,126 25 as the actual winnings in the United States—a statement that must give ample encouragement to hreeders. In some quartere it ie charged that the total for 1882 is unduly exaggerated hy the addition of winners' etakes, especially for the several $10,000 matches which were run in Utah. The whole of the etakes are included, for the money involved was all deposited and the final ownership of it was risked on the success or failure of the horses named. Although it may he eomewhat late to present statistics of the racing during 1882, the compilation of which has involved almost continuous labor since the eeason closed in this section of the country, they are given briefly herewith. The number of horses with known pedigrees that ran during the year were 1,254, which with 772 of unknown pedigrees make a total of 2,026 ae against a total of 951 in 1876. The total number of races run in the United States and Canada was 2,273, which with 46 won abroad makee a total of 2,319; of these 2,078 were races on the flat and 241 either hurdle races or steeplechasee. Waut of space forbids an extended table of the number of races run at the several distances, but the following condeueation, which ehowe the totals for 1876 and 1882, gives much of the needed iuformation:

Distances.	1876.	1882.
Under six furlongs, dashes and heats	98	318
Six furlongs and under a mile, dashes and heats	58	409
At a mile, dashes and heats	265	645
Over a mile and under two miles, dashes and heats	176	623
Two miles and under three miles, dashes and heats	91	72
Three miles and over, dashes and heats	18	11
Totals	706	2,078

Of the 2,078 races on the flat last year, 439 of them were heat races, with a total of 1,095 heats. Of the 241 races won by the jumpers, 133 were steeplechases. There were three dead-heats for which the money was divided and eleven for which the horses making the dead-heat "run off." There was one race (at Heleua, Mont.) which was ordered to be run over by reason of alleged fraud, which the second trial did not sustain; two were declared void—one for alleged fraud and the other by reasou of bad weather. There was one race against time, twelve walk-overs and twenty-seveu matches, twenty-three of which were run aud four for which forfeit was paid and received.

Racing Fixtures for 1883.

The following are the most important Eastern racing fixtures announced to date:

New Orleans—Louisiana Jockey Club, March 31st to April 7th.

Nashville—Blood Horse Association, April 30th to May 5th.

Lexington—Kentucky Associatiou, May 9th to 17th.

Washington—National Jockey Club, May 15th to 18th.

Baltimore—Maryland Jockey Clnb, May 22d to 25th.

Louisville—Lonisville Jockey Club, May 22d to June 6th.

New York—American Jockey Club, May 30th to Jnne 9th.

Coney Island—Brighton Racing Association, May 30th to November 15th.

Cincinnati, Covington, } Latonia Jockey Club, June 9th to 15th.

St. Louis—St. Louis Jockey Club, June 12th to 19th.

Chicago—Chicago Driving Park Association, Jnne 27th to July 6th.

Long Branch—Monmouth Park Association, July 4th to August 25th.

Saratoga—Saratoga Association, July 21st to August 30th.

An announcement of a trotting stake for two-year-olds, given by the State Agricultural Society, will be found in our advertising columns. It will receive editorial attention next week.

ATHLETICS.

The New York "Spirit" on Pugilism.

Many years ago pugilism had some claims to recognition as a sport. Its professors had hrains or bravery—frequently hoth; many of them exhibited all those qnalities which would have commanded success in other and hetter husiness, and a few did suhsequently make their mark as merchants, and even as statesmen. The contests of the prize-ring, though hrutal, were honorably managed aud honestly fought, and the conduct of all its affairs was governed strictly by the manly motto, "May the hest man win."

But year after year pugilism chauged, and changed for the worse. Gulley and Cribb, Molinenx and Ward, Spring and Paddock, Langham and Sayers, died or retired, and their successors had neither ahility nor inclination to maintain the honorable traditions of their calling. The downward progression continued until at last pugilism sank beneath the notice of decent people, and honest prize-fighting existed only in memory. The mantle which once graced the shoulders of real champions—men who earned their honors hy skill, bravery, and honesty—was now dragged through the mire of deceit and cowardice; the roll-call of pugilists showed only the names of hullies and hraggarts, swindlers and thieves, burglars and murderers.

Quite recently certain unscrupulons speculators devised a cunning scheme to fill their pockets, hy organizing a pugilistic mania and revivifying the decayed corpse of the prize-ring. The deplorable success of this nefarious plot is now "known and read of all men," but its salient features are well worth a hrief rehearsal.

A hrawny young boxer from Boston, who had clearly demonstrated his superiority over his fellows, was selected as the pugilistic John the Baptist, and sent up and down the land to preach and practice the new dispensation of "knocking-out." He proved to be an able apostle; wrote letters and issued challenges, exhibited and sparred; fought with pen and fists, with gloves and without gloves; aud brought much money to the treasury of his managers. Next, a third-rate British huffer was imported, and allowed to prove his marked inferiority to the native article. Then an elderly ex-champion, recently released from a long term in prison, was associated with the present champion, and this double team are now traveling abont the United States, as successful rivals to Salvini and the Jersey Lily. And last of all, a retired prize-fighter, now in the "sere and yellow leaf," is summoued from Australia and lands in Califoruia, hringing with him a half-hreed heathen novice, who has not, as yet, estahlished any genuine claim to pugilistic honors. This pair of worthies journey leisurely from San Francisco to New York City in such triumphal style as has heen seen here ouly during the visits of Grand Duke Alexis and the Prince of Wales.

When we seek the reason of what seems so unreasonahle—this sudden leap to popularity of an obsolete and crimiual game—we find it—and find it nowhere else—in the disgraceful administration of the daily press. The scope of all jonrnaliem is to teach, not to he taught; to lead, not to follow puhlic sentiment. The province of honest journalism is to lead the puhlic up, not down; to elevate, rather than degrade; to preserve, instead of destroying.

During the past twelvemonth prize-fighting has heeu specially brought to the attention of American editors. It is, as every one knows, a criminal offense, punishahle by fine and imprisonment—just as clearly a crime as larceny or burglary, arson or manslaughter. Even if modern pugilism were not illegal, its inherent degradation, its dishonest mauagemeut, its vile surroundings, and the unsavory character and practices of its professors, remove it outside the pale of reputable news, and heneath the attention of honest folk.

Here we have a game which is degrading, hrutal and criminal; which works evil and evil only; which has no valid excuse for existence; aud whose struggle for continuauce and popularity is a hattle against good order aud decency and humanity. Its hreath of life is newspaper notoriety, and if, from thie time on, any mention of pugilism was strictly excluded from all newspapers, the game, with its professors and promoters, would, before New Year's Day, he effectually squelched.

In such a juncture it seems ahsolutely sure that the editors of reputable American newspapers would, in handling this nuisance, either crush it by sensible silence—or, if noticing it at all, do so only to drepecate and protest. But the facts are diametrically aud disgracefully differeut. All over the land we find paragraph after paragraph, columu upou column, devoted to blazoning the sayings and doiugs, dress aud food, history and projects, of a gang of ruffians, most of whom, if justice were done, would "do the State some service" in compulsory retirement.

Country newspapers can plead in extenuation of their conduct, tbat, inasmuch as they depend ou the Associated Press for general news, and are forced to pay for what is sent to them whether used or not, they feel pecuniarily unable to surpress what is undesirable. But uo possible shadow of excuse can be fonnd for the great dailies of New York City, which gather their own news, and can treat it as they please. They have proved to be the chiefest of all sinners iu this matter. Day after day their readers are surfeited with pngilism—past, present, and to come; romance, reminiscence, history aud prophecy; incident and anecdote; prolix miuuteness and disgusting detail. Nor is this stuff allowed to take qniet position amid general news, bnt it is thrust into ridiculous prominence by all the ingenious devices of the printer's art, by lavish display and startling head-lines.

We have purposely made this condemnation sweeping and inclusive, becanse all have been guilty, some in greater degree than others, but all far beyond deceucy or common sense. *Herald* and *World*, *Times* and *Tribune*, *Sun* and *Star*, *Truth* and *Journal*, *News* and *Telegram*, *Commercial* and *Mail*, *Graphic* and *Post*, have seemed to vie with each other in cramming their readers with huge daily doses of prize-fighting gossip.

It would be well for the editors-in-chief of these jonrnals to carefully review their files for the past month. They will surely find therein much food for reflection, much righteous cause for shame. Possibly such an examination might convince them that their own reputations and their duty to their readers unite in demanding a prompt and sweeping reform in the management of their news departments, and the immediate relegation of pugilism to its proper position—in the police reports.

We are proud to be able to state the gratifyiug fact that the reputable sporting newspapers of America have not in any way assisted in the present absurd apotheosis of prize-fighting, and their columns are not soiled with pugilistic filth.

Harriman Gets Left.

C. A. Harriman the pedestrian ran in a twenty mile race against a field of amateurs at Nevada City last Satnrday evening and was heaten nearly a mile. The details of the affair are thus given in the *Transcript*: The conditions of the race were that the champion shonld run 20 miles, the ten amateurs to rnn two consecntive miles each. The track measured 30 laps to the mile, and was nearly square. The sawdnst had appeared dry enough when first laid, hut the warmth of the room soon hronght out the moisture in it, aud the track was thus rendered too slippery for fast running. Shortly after 8 o'clock Harriman and A. E. Oliver got off for the first two miles, hut on the first lap the champion's feet flew from nnder him on a turn and he fell headlong. Picking himself up as soon as possible, hut not till Oliver had gained a lap, he started off again more cautiously and did not meet with another accident during the evening. Oliver gained 1½ laps on him in two miles, and was then relieved hy Len Holhrook who gained 2⅔ laps. Thomas Eddy gained a sparse third, and Frank Vaughn gained two-thirds. This placed Harriman 5 laps hehind at the beginning of the eighth mile, hut he recovered 1¾ laps on Owen Harrigan and 4¼ on C. C. Watts, which placed him 1 lap in the lead. Oliver then returned for a second run and gained 6½ laps. By this time the track was so badly cut up and heavy that Harriman had to make every step with extreme care, and he fouud it impossible to let himself out under the circumstances, while the amatenrs heing of smaller size did not seem to experience any tronhle in keeping their legs under them. S. A. Chase gained 9⅔ laps, Wm. Mooney 11⅓, and A. O. Roy 1, making the amateurs 27⅓ laps, or about nine-teuths of a mile, ahead at the close of the 20 miles. The contest was quite spirited, the only drawhack heing the condition of the track which stretched the time of the 20 miles ont to 2 hours and 45 minutes.

Heel and Toe.

John Callahan met Thomas Pearson, a Vallejo walker, at Amory Hall in that city last Monday evening for a five-mile walk in which the record was in no way endangered. The reporter of the Vallejo *Chronicle* who is pleased to call it a very exciting affair fnrnishes the following particulars: The track was not of the hest for a match of this description, there heing twenty-two laps to the mile which made the turns very short. Pearson made his appearance at 8:55, aud made several laps, which fairly exhihited his easy, graceful gait. He was the favorite from the commencement. At five minntes past nine Callahan put in an appearance ou the track, and walked around the course several times, his quick nervous movements presenting quite a contrast to his opponent. At 9:23 the start was made; and Pearson took the lead almost from the start. The first mile was made in eight minutes and sixteen seconds, the record on the board reading: Pearson 8:16; Callahan 8:17. On the seveuth lap of the secoud mile, Callahau passed Pearson soon after passing the turu, and kept the lead until near the end of the last lap of the fifth mile, when Pearson by a quick spurt, passed his opponent, and was awarded the race. The time as kept hy the timer and recorded hy the scorers are: Second mile, Callahan, 17:04; Pearson, 17:05; third mile, Callahan, 26; Pearson, 26:01; fourth mile, Callahan, 34:59; Pearson, 34:60; fifth mile, Pearson, 42:24¾; Callahan 42:25. This would make the time of each consecutive mile be: First, 8:16; second, 8:48; third, 8:50; fourth, 8:59; fifth, 8:41¾. The race was very satisfactcry to a majority of the spectators, who rewarded every spurt with manifestations of applause. The contestants put forth every effort, and many who witnessed a contest of this description for the first time were convinced that pedestrianism is iudeed a great test of physical endurance. At the close of the race, objections were made hy Callahan on the score that Pearson had stepped on his heels, aud also that he won the race by running in at the close. The judges held that the first was an accideut, aud ignored the second. Pool selling was not at all lively, hut what few pools were sold the odds were two to one in favor of Pearson.

Maurice Viguaux, the French expert hilliard-player, who was engaged to come to this country to play in the Chicago aud New York tournaments, did not sail from Havre on Saturday last, as was announced. It is asserted that Vignaux has been frightened by the receut sinking of two steamers and has refused to come over on any consideration; hut this is denied hy the H. W. Collender Company of New York, to whom he is uuder contract to play.

Mr. L. B. Lindsley, one of the intelligent and earnest stock breeders of the Weh-foot State, has been visiting the stock farms around the bay, and sailed for home, via Portlaud, last Tuesday.

Owing to a press upon our columns our "Answers to Correspondeuts" department has been rather cavalierly treated of late. We shall eudeavor to hring it up to date next week.

GAME PROTECTION.

Views of Some Leading Sportsmen on the Proposed Amendments.

A. W. Havens.

A. W. Havens, a member of the gun club of this city and also connected with the Alameda Sportsman's Club, heartily indorsed a shortening of the quail open season, as it would result in increased sport in a very short time. As a general rule quail were not full grown at the expiration of the present close season. The proposed amendment requiring farmers or others who object to shooting on their premises to post notices to that effect at intervals of fifty acres did not meet with his approval, as in his opinion it would work a great hardship on those whose land ran up into the mountains, where no hunter would care to roam about in search of game. The result of enforcing such a provision would be to literally cover broad fields with sign posts, and all to no purpose. His experience led him to believe that any reputable sportsman could readily obtain permission to enter private or inclosed lands for the purpose of shooting, without the necessity of placing himself in the position of a trespasser. Very naturally, the farmers objected strenuously to the presence of pot hunters and careless persons upon their lands, because their negligence often threatened valuable interests. Gates were left open, and not unfrequently fires were started which caused much damage. The posting of notices as provided in the amendment would not in his judgment exert any influence in favor of hunting preserves for these reasons. The attention of the legislators should be directed to the suppression of shooting by moonlight, or in a comparatively short time ducks would be exceedingly scarce. Invariably of a night ducks, and water fowl generally, came into the feeding grounds, only to be frightened away by reckless hunters, who for every one they killed succeeded in driving fully one hundred away. The Alameda County Sportsmen's Association had incorporated in its by-laws a provision against moonlight shooting and he believed the same should be done by the other sporting clubs.

F. H. Putzman.

F. H. Putzman stated that as a rule the amendments presented on behalf of the State Sportsmen's Association answered all the requirements of game laws. Issue had been joined as between sportsmen and the farmers, the latter taking high ground as to the destruction of their vineyards and crops by an invasion of quail and ducks. Their interests necessarily conflicted to a certain extent and would always continue to be somewhat antagonistic. The farmers were obliged to protect their crops, and could not be expected to sacrifice them for the purpose of maintaining a greater or less number of ducks or quail. For this reason, though moonlight shooting frightened ducks away from the feeding grounds, it could hardly be asked, in justice to the farmers, that they confine their shooting to the daytime. Quail should be so restricted as to allow them to propagate. The present limit found the brood very small, while the oppressive heat rendered the sport exceedingly poor. The trapping of quail, in sections of the country where they abound and where they were destructive to the crops, should be allowed for the purpose of stocking other sections.

Jerry Browell Jr.

Jerry Browell Jr., Secretary of the Cosmopolitan Shooting Club, was very pronounced in his opinion that unless steps were taken to prevent the indiscriminate killing of game sportsmen would soon be obliged to seek pastures new for the pursuit of hunting. The bill which allowed farmers to kill quail in and out of season aimed a fatal blow at the laws, and if adopted would rob them of their force and meaning. On the other hand, a proper regard should be had for the welfare of the farmer in the pursuit of his legitimate interests, so that his crops should not be made dependent upon the pleasure of hunters. Amusement and business were hardly convertible terms, and if circumstances arose which rendered moonlight shooting necessary for the protection of crops, or vineyards, nothing should be incorporated in the game laws which should prevent it. In support of this position, he cited the ravages which had been made at Mowry's ranch, a favorite resort for sportsmen, where ducks in a period of two days had almost ruined a valuable crop. In brief, he believed in extending to the farmer the same protection and privileges requested by sportsmen.

H. Spencer,

a prominent member of the California Wing Shooting Club expressed much confidence in the provisions of the bill emanating from the State Sportsmen's Association. The shortening of the open and the corresponding lengthening of the close season was a most wholesome change, and would no doubt be fully appreciated in the event of the bill being adopted. From personal experience as regards the shooting of quail the sport about September was by no means such as to enthuse the average sportsman, because at that time quail were not only far from attaining full growth, but were also unfit for even good food. An extension of the close season would give them ample time to propagate and to become sufficiently strong and numerous to afford excellent shooting. Under the present system it was only a question of time when the choicest hunting grounds would be stripped of every vestige of game, leaving nothing with which to divert the hunters view from a useless tramp. He also stated in connection with what is popularly known as the farmers' bill, that its passage would virtually do away with the game laws, as promiscuous shooting in and out of season or even trapping of quail under these conditions would be attended with the most serious consequence to game interests. Every precaution which might be taken against any abuse of the power conferred upon farmers would practically be valueless. Moonlight shooting he believed could not be justly prohibited, because it would operate against farming interests, by threatening the crops. Invariably ducks swarmed upon fertile fields at night, making feeding grounds out of them and frequently ruining whole acres. The only protection which farmers could resort to was moonlight shooting, and in view of these facts he objected to any provision which would take this means of solving the difficulty from them.

P. McShane,

Another enthusiastic shooter, was in favor of modifying the laws so as to afford some protection to snipe. In other respects, he was perfectly satisfied with the bill supported by the State Sportsmen'a Association. The open season for quail, duck and snipe should commence on the 1st day of October, continuing until February 1st, with a further extension in favor of snipe until the first day of March. The proposed alterations in the law protecting deer were highly commendable. Speaking with reference to the objection made by those living in the valleys, that they had no opportunity of shooting deer until they were driven into the valleys by the snowfall in the mountains, he said that the objection was frivolous, inasmuch as sportsmen from this city were obliged to make extended trips before arriving upon the shooting grounds, and sportsmen in the northern portion of the State should be expected to subject themselves to some inconvenience for the ultimate good of the sport. The fish laws, in his estimation, were well adapted to the requirements of the occasion and needed little or no modification. The bill presented on behalf of the farmers and providing for indiscriminate shooting was well calculated to defeat the very object of the game laws, and rendered futile any efforts at game protection.

J. K. Orr.

Vice-President of the State Sportsmen's Association and a member of the Gun Club, who has given the subject of game protection considerable attention during a period of over ten years, during which time he has been prominently identified with field sports, had very fixed ideas concerning the proposed amendments. He believed that no extended argument was necessary in support of the importance of certain legislation prescribing during which season game should be killed. He was satisfied that if some salutary provisions regulating the open and close seasons had been incorporated in the laws ten years ago, the complaint of depleted forests and streams would have no foundation at present. As it is the cutting off of two weeks at the commencement and a similar period at the end of the present open season was a move in the right direction. Experience demonstrated that quail were not fit for good sport by the middle of September, and as a rule the brood were unable to protect themselves and could hardly be considered good eating. This was especially the case when the rains extended into April and May. Should the matter of game protection reach an unexpected climax bringing rival interests into conflict, some allowance might possibly be made for the climatic difference between the northern and southern counties. For instance, quail in Los Angeles mature earlier than in other localities. Following out the same line of argument, some respect should be paid to the desires of the upper country gentlemen relative to the deer law. Complaint was made by them that restrictive clauses of the present game law virtually prevented them from shooting deer, because until driven from the mountains into the valleys by reason of the snow, the casual hunters were obliged to forego their favorite sport. In view of these facts, it might be well to insert a clause in the law providing for shooting in the northern counties, making the open season commence on October 1st and end on January 1st.

The prevailing idea founded upon experience, is that when deer are beginning to rut they should not be hunted. In the first place they are unfit for food, and secondly they too easily fall a prey to ruthless hunters, whose only object is to kill as many as possible for market purposes. During the rutting season, the flesh of the deer is strongly impregnated with a musty flavor which is highly disagreeable. The ravages of pot-hunters, and the little respect paid for the close season, made deer exceedingly scarce, so that if the breeding stock which now remained, and a very limited one at that, was killed off, a short time only would elapse before deer shooting would have to be abandoned. A law should be adopted preventing the killing of does for at least twenty years, and if possible made perpetual. By this means, the sport would be preserved and gradually the number of deer would be very materially increased. Speaking in relation to Section 8 of the proposed amendments, Mr. Orr stated that the passing of a law which compelled property owners who objected to shooting on their premises to post notices to that effect at intervals of fifty acres would work a great hardship and would entail a very considerable outlay of money. He believed that the power to grant or withhold permission to shoot upon private land should rest entirely with the proprietor and that he should not be compelled to signify his wishes by going to the trouble and expense of posting notices according to the proposed amendment. It was a comparatively easy matter for a sportsman to obtain permission to shoot on enclosed land, but farmers were obliged to protect themselves against the vandalism of hoodlums who had no respect for private rights and whose visits were invariably accompanied by broken fences, strayed cattle and not unfrequently disastrous fires, the results either of their carelessness or downright cussedness. If persisted in, the attempt to force farmers to placard their lands would lead to an inevitable conflict as between sportsmen and landowners, and the result would be that no shooting would be allowed. Under the head of moonlight shooting, he stated that no more serious mistake could possibly be made than to allow its continuance, as it was the means of driving off the ducks from feeding grounds, and that the flash of the gun frightened them so that they never returned. It was of prime importance that certain ducks should be protected, such as the mallard, gadwell, wood or summer ducks and the cinnamon teal, because they remained in the State throughout the year, while the others, being migratory, protected themselves. The difficulty, however, would be that hunters would not stop to consider what ducks were included in the operation of the law, but would fire away indiscriminately so that a general duck law was imperative. He was also in favor of a law protecting snipe.

THE STAGE.

The Baldwin.

The production of "Young Mrs. Winthrop" at the Baldwin Theater created a great deal of public interest, not only on account of the drama that had been pronounced so successful in New York, but also in regard to the debut of Miss Carrie Turner, who, having created the part, made her debut here as Constance in the title role. The motive of the play is as trite as its treatment is bright, impassioned, humorous and interesting. The estrangement of two young, happy people through the causeless jealousy of the wife, and their reconciliation at a late period has formed the basis of a thousand dramatic works, with the ever same foreseen denouement, but it is safe to say that the story was never told in a more winsome and delightful manner than is the case with this last production from the pen of Bronson Howard. The idea of depending more on a quiet, pathetic method that appeals to the sympathy of the audience rather than seeking strong dramatic scenes that arouse the imagination is to be traced, as usual, to the French stage, where a quarter of a century ago since a little, simple, one-act piece, entitled "La Joie Fait Peur," written by Madame Emil de Giradin, filled the classic Theatre Francais for an entire season. Later Madame Vestris produced it at the London Lyceum under the name of "Sunshine thro' the Clouds," and in the principal part she closed her brilliant theatrical career. Such a gem did not escape the appreciative research of Dion Boucicault, who, as "Kerry," made it one of the principal parts of his repertoire. Other pure and simple stories followed in imitation of this charming play, and at one time it seemed as if the French dramatic art were to reach a higher plane in morality and suggestiveness, but it was quickly found that there was a patronage to this style of entertainment that was limited to the boxes and stalls, and the managers were forced to return to plays that were treated in a more powerful method, and then came "The Two Orphans," "Led Astray," "The Danicheffs," "A Celebrated Case," and other dramas that attracted all the elements of a fickle, but generous public. "Young Mrs. Winthrop" is a bright example of the higher and purer dramatic art, but it is doubtful if the play will ever achieve, outside of New York, the success of any one of the above mentioned plays, and its production at the Queen's Theater in London will be followed with a great amount of interest, as there, as in New York, there are a great many families who will not visit a theater to witness plays in which the transgression of the commandment forms the basis of the plot.

"Young Mrs. Winthrop" is admirably cast and put upon the stage, and Miss Carrie Turner, although lacking somewhat of dramatic fire in some of the more exciting scenes (that may indeed, have been toned down to order) created a very favorable impression as the heroine, and she was ably seconded by E. J. Buckley as Douglas Winthrop, this young actor showing such study combined with natural talent that will soon place him at the head of his profession in this line of business. Miss Sydney Cowell does not appear to grasp the possibilities of such a part as Mrs. Dick Chetwyn, that would suit Mrs. John Wood like a glove, but she is pleasant and glosses over with great skill some of the bright cynical remarks of the dashing widow. Miss Enid Leslie as the blind girl played with naturalness and simplicity, but is it not time that so old a method of playing on the sympathy of the audience through such a calamity as blindness should be tabooed by our leading dramatic scribes? Mr. and Mrs. Whiffen were, as usual, most acceptable in their parts and the minor characters were given with quiet effect in unison with the tone of the piece. "Young Mrs. Winthrop" ought to have a good month's run. The two interiors by W. T. Porter are gems of decorative art and no expense has been spared to ensure success.

Ellmenreich at Haverly's.

At the California, Madam Ellmenreich has continued her engagement to moderate business, and her impersonation of Adrienne Lecouvreur and Marie Stuart confirms the previous impressions of her undoubted talent and dramatic strength, but at the same time show that the artist has yet to undergo a course of severe study and practice before she can overcome the difficulties of the English language, especially in the more impassionate scenes of these exacting parts. Madam Ellmenreich has scored a success, and when the ordeal of playing in a foreign language relaxes the holding on the imagination, so that she can give a more delicate shading to the lighter parts of the characters, she is bound to be foremost among our dramatic attractions especially if she can secure "Odette" or some other similar play that would show her talent to the utmost advantage. The support in many respects was inferior to that rendered by the German artists and was not up to the usual standard of excellence at this theater. On Monday next "The City," a new melodrama by Len Grover will be presented for the first time after a long and careful preparation.

Bush Street Theater.

After the delightful whimsicalities of the Rice Surprise Party, the production of "My Sweetheart" suffered somewhat by comparison, but the light play with its songs, dances and quaint love making will be of sufficient attraction to insure good business for two weeks. when "Pop" will once more fill the Bush Street Theater to repletion. Miss Minnie Palmer is a bright, vivacious little party who at once enlists popular favor, and although the piece requires no great amount of talent, she is very agreeable and attractive in all her business which is somewhat suggestive of the Lotta effects. R. E. Graham has confirmed the good impression he made here, and met with a cordial reception. The other personages are well presented and T. H. Hawkins as a sport down on his luck gives a neat and forcible bit of character acting that shows he possesses true dramatic instinct that will lead to speedy promotion in his career. "My Sweetheart" will be continued all next week.

Emerson's.

At the Minstrels the business continues to be from "fair to fine," and next week will witness another change in the programme, the chief attraction being a burlesque on "The Marescot," which is said to abound in good things and pretty songs and concerted music. The management deserves great credit for this constant search after novelties, and that is the only way in which a minstrel company can compete successfully with the other amusements of the city.

"Through Fire."

At the Grand Opera House a new drama will be given on Monday and during the week under the management of Mr. Aveling. It is entitled "Through Fire," and is said to possess a strong and interesting plot.

The Tivoli.

The Tivoli has scored another triumph with "The Bridge of Sighs," a comic opera composed in Offenbach's earlier and sprightlier manner. The work is admirably mounted and costumed, and the principal characters are well sustained save in the comic element, where a disposition is shown to create merriment by mere buffoonery instead of more legitimate effects. The piece promises to secure a long run.

CENTERBOARD BOATS.—After describing a certain race of last season the New York *Spirit* says: "More conclusive proof, we think, can hardly be afforded of the superiority of the centerboard yacht so far as speed is concerned, and we know that they are handier every way, and much more suited to our yachting waters. Just now the demand seems to be for keel boats of a small class. We venture to predict that in every instance they will be beaten by old centerboards of the same size. The cutter craze, which prevailed to some extent last season, has happily passed away, and so far as we have yet learned, there is not a single keel sloop building that has not plenty of beam. As a relic of this cutter mania, we have now the demand for the deep keel sloop. There is nothing particularly objectionable about such craft; they will be safe and comfortable boats, but, alas, they will also be slow, and that is fatal to anything bearing the title of yacht, and in the end we think it will be found that nothing yet has been discovered for the purpose of yachting that is an improvement on the centerboard schooner or sloop."

THE STABLE.

Fasteners of Toe-Weights.

The most convenient method of attaching toe-weights is by using a spur which is welded to the front part of the shoe or tip. The convenience arises from there being no trouble with other kinds of fastenings as in one patented invention the only thing necessary is to slip the weight on, when the bevel of the spur and the tapering form securely holds it in place. It is evident that every time the foot strikes the ground the more firm will he the clasp, and to release it, several sharp blows with a hammer will he necessary. With this, of course, there can be no change in position, and to give the power to regulate the height of the weight on the foot a screw has been added in some of them. A thread is cut in a hole in the weight and the screw acting in this presses against the spur and any desired elevation can he obtained.

But the great drawback to the stationary and unremovable spur is that in the first place it is unsightly, and a still graver objection is that there is a chance for the horse to injure itself. Very frequently a horse will scrape a foot against the opposite leg, and in that case the sharp edge of the bevel will do damage. When the animal is walking, led by the bridle, a sudden start from fright, or, perhaps, in play, the legs are crossed, and injury follows.

Last summer we saw a mare belonging to Mr. Titus which caught the spur and bent it so far forward that it was in a horizontal position when she came back to the stable. Nearly all the appliances to do away with the objections of a stationary spur have made necessary the mutilating of the horn in order to make a slot through which the part that fastened it to the shoe could he thrust.

When the spur is detached there is an ugly looking cut in which gravel and clay will accumulate, and in some cases become so firmly impacted that it is troublesome to remove. In the many experiments I have tried with weights there was one plan that I thought highly of until I fell on one much simpler and in every respect better, and which will be described hereafter. In that which has been discarded there was a piece of steel in the shape of a keystone, about the length and width of those worn as a watch charm, and an eighth of an inch in thickness. The front part was so fashioned that a semi-circle of about three-eighths of an inch in diameter projected upward and in this a hole was drilled at right angles to the slope of the front part of the hoof, and a thread cut in it. The back part of the projection was also filed away to the same angle as the bole, and the whole thing hardened so that there would be little wear. A place was filed in the shoe, or rather the tip, and the keystone driven in, the edges having been beveled so that it was held fast. The front part of the keystone was finsh with the toe, and a round file used to cut away the horn where the projection came. The part cut away would be about the same as for a very small clip, and the file being of the same diameter as the projection a close fit was insured. The spur extending up the foot was the same as that in common use, and the lower portion was turned at a right angle, and formed into a screw to fit the threads in the other part. Picking the foot up, a few revolutions sent the screw home with the spur in the center of the foot ready to attach the weight, the concavity of which kept the screw from turning, which was rendered impossible by the strap of the quarter boot.

When the spur was detached a screw was put in the hole and the head sunk so low as to leave a perfectly smooth surface. This short description will be found sufficient, especially as a far better plan will be given, though after several months use I was so highly impressed with its advantages over others that I had tried that the papers were prepared to apply for a patent.

"Strap weights," viz., those that depended on straps for the main fastenings, have generally gone out of use. By far the best of that kind I ever used was the Eureka, the bent hook of which through the round hole in the toe of the shoe giving it such a strong grasp that it was not necessary to bind it very hard with the strap.

There is scarcely a shadow of doubt of the ill effects which follow the binding of the foot with a tightly drawn strap, especially when the lower part of the foot is held by a full shoe. The spring of the coronent is thus fettered, and the whole foot is hampered. I overcame that objection in the Eurekas, as the use of tips entailed a fastening which did not go round the heel, and a slot was filed, partly in the tip and partly in the horn, to receive the strap. At that time I thought it imperative that there should he a projection like the heel of a shoe to keep the strap from slipping under the foot, but since then have discovered a method to prevent the strap from coming down which will be explained hereafter. With one exception, all of the toe-weights that I have seen have depended in a measure on the shoe for either the whole or a portion of the fastening, and, consequently, a loss of the shoe compelled the loss of the weight. The exception is something similar to the kind I have used before I had any knowledge that there was anything like it, though in all probability the other is entitled to priority. That was to fasten the weight to the horn with screws similar to a wood-screw, two being used to give the required solidity. These are set in an angle, the points inclining together, and there is no question that for any weight not too heavy the fastening is safe. I wrote to the inventor for specimens which were received last August, my intentions being to give them a trial, but as they were so nearly like the kind I had been using, and in one respect having a preference for my own, have no used them. In one important particular they are superior to those I use as they do not require anything but the two screws to hold them in place, mine necessitating the use of quarter boots, and there are horses, particularly colts, which are liable to chafe with the best constructed boot.

Those which I received weigh six ounces each, and the screws project three-eighths of an inch. From center to center of the hole on the inside is one and three-eighths inches, and when the screws are pressed home in the countersink there is an inch between the points. This converging of the points not only gives a better hold, the same as dovetailing, but it also lessens the danger of penetrating through a thin wall. From being accustomed to the spurs welded to the shoe and the other plans for fastening toe-weights people are prone to think that so simple a contrivance is not sufficient, if even there was no danger from wounding the sensitive portion of the foot. They will also argue that there must be motion enough to loosen the screw, and that after a few times the thread in the horn will be worn smooth. That it is effective I know from the tenacity with which the live horn will hold even a smaller screw than those which are used, and if the screw is driven home there is not motion enough to cause it to lose its hold. Those that I have tried have demonstrated this view to be correct, inasmuch as on two occasions the quarter boot slipped and the screw still held the weight in place. Although I have used mine for some time before the date of the patent which covers the fastening with screws to the horn it is probably an infringement, and in describing it it must not be considered a warrant for others to use it. I took a piece of sheet brass an eighth of an inch in thickness, and cut it into the form I wanted. It is something of the shape of a heart with a continuation below to the desired length. If the design was to have the weight low on the foot it was short, and if high long. Near the bottom a hole is made for the screw to go through, the corresponding hole in the horn being from a quarter to half an inch above the junction of the horn and tip. The desired weight made of the same sheet brass or thicker copper is riveted to the heart-shaped part, having the same concavity to fit the convexity of the hoof. The part next the foot is carried up nearly to the coronet, and an outside strip is also made of the same length. The object of this is to form a slot through which the lower strap of the quarter-boot is passed and the upper strap is run through a leather loop constructed as follows: Being impressed with the idea that there should be some elastic material between the weight and the foot, a piece of leather of the same shape, though covering rather more surface, was used for lining, the rivets which fasten the plates together holding it, and the upper part is turned over back to the rivet, forming the loop. This is to have a softer material near the coronet than the metal. The quarter-boot must he made with double straps and to cover a part of the heel so as to insure it from slipping down. The straps are buckled when the weight is higher on the foot than it is to be worn, and then pushed down so that the screw can he introduced. Notwithstanding the added thickness of the leather lining the longest screw I have used has been five-eighths of an inch, No. 9, and in most instances one-half an inch of the same number. Before using the screws in the horn and previous to the keystone fastener being thought of, I tried cutting a thread in the tip and the horn, half in each. But the thread on the metal part was too fine for the horn and it was unsatisfactory. At that time I did not think of using the ordinary woodscrew, and the small taps and dies that I had were very finely cut.

The use of the woodscrew not only taught me a better manner of fastening the toe-weights, as it also helped me out of a difficulty in attaching scalping-boots to a bare foot. To keep these in place I thought it was imperative to have at least one projection at the heel in order to fasten it properly, and in the case of Anteeo followed the practice heretofore described of wearing a three-quarter shoe. With that I used the keystone at first, and then the woodscrew driven into the horn. A thin piece of metal was let into the quarter boot for the screw to pass through, and I found the method far superior to a strap drawn through a slot. But Antevolo also needed the protection of a scalper, and every plan I tried of attaching it to the speedy cut above was a failure. I tried several ways without any success, and as a last resort put on the boot the same as if there was a projecting heel. Luckily the scalper was made of the hardest, stiffest leather, and the heel strap was doubled at the place where it would rest on a shoe. I took another piece of moderately thick leather, perhaps two inches wide, uniting it together after the heel strap was slipped between. The job was complete and the only instance the boot came off was when I had been negligent in renewing the hole and the horn wore away until there was nothing to hold. The best place I have found to place the screw is about an inch outside of the center of the toe, and the leather is cut out in a curve back of the screw to near the same as when fastening the toe-weights and quarter-boots; the strap is buckled before it is shoved down to its place and in this way the tugging at the strap is avoided. The job is much easier than when the other method of fastening the scalper is followed, and the danger of the strap breaking is done away with.

It is far easier to make the holes in the horn than many imagine. I use a small Morse drill, put in a handle and a few seconds all-sufficient. Where two screws are used there must be due care taken to drill the holes in the foot exactly corresponding with those in the metal, though this is easily done by using in the first place a Morse drill, the same size as the hole in the weight, and by giving it a turn or two the center is marked for the smaller. Drive that screw home, having been careful to give the proper angle, and then put in the other hole.

I have no desire to induce people to use any particular pattern of weight. My preferences are not offered as a guide for others to follow, and it may be that there are drawbacks that I have failed to discover.

Meager as this appendix is in suggestions, and though I am loth to present it in the shape that I do, my readers will coincide with me that it is better than to mislead with opinions which have no firmer basis than the wildest conjectures. That immense benefits have followed the introduction of toe-weights is beyond question; that the ill effects have been reduced at least ninety per cent. by a more intelligent use is also certain; that the advantages have far overbalanced the drawbacks I implicitly believe, and the trainer of trotters who does not make use of them in some cases is either very fortunate in the pupils he has or is behind the times.

When colts are doing well, going squarely, improving in speed as rapidly as a reasonable man can desire, my advice is to get well enough alone. When the reverse is the case, and there is a tendency to hitch, singlefoot, pace, shorten the strides, etc., try weights, light at first, heavier if these do not correct. But it also must be borne in mind that every ounce is additional strain on the muscles and tendons, and oftentimes in the training of trotters, as in other pursuits, "the more haste the less speed."

The "side-weight" question is even more troublesome to me than that which pertains to the forefoot, and further than to give the result of a few experiments, and the reasoning which these have led to I will not go. Nearly twenty years ago I wrote that the action of the forelegs was more under the control of man than that of the hind, and this assumption I still hold to be correct. In common with a large majority of men of the present day who have paid a good deal of attention to the trotting action I have changed the views, in some respect, in regard to an "open gait," and in place of considering it essential that the hind legs should be carried apart enough to clear the forelegs on the outside have become convinced that it is not necessary. Some of the fastest go close with their hind feet, and usually the Electioneers carry both fore and hind feet near together. If there is no cutting or wounding of coronet, pastern, shin or knee this is manifestly a hnsbanding of force, the same as when there is just knee and hock action sufficient to give length of stride. Excess of action of any kind is a waste of physical force, and the smooth, easy-going trotter takes the same status as the "daisy-cutter" among racehorses. But when a horse carries the limbs so that they receive a violent blow from the passing foot some remedy has to be discovered. Though in a great number of instances boots offer sufficient protection there are cases when they fail to give the protection, and valuable as these appendages are there are cases beyond the power they possess to correct. In such a case as when the shin, ankle or pastern of the hind leg was struck, the nearly unanimous agreement among trainers was to use side-weights, under the impression that by putting them on the outside of the feet the legs would be carried farther apart. I felt the utmost confidence that this was the correct idea, and in a previous chapter give the history of a pacer that was cured of a habit of knocking his knees by weighting the outside of his front shoes and giving his slow work with an instrument in "his fork" that kept up a steady outward pressure. I am of the opinion now that the benefit came from the pressing outward, as that was continued some length of time, and when driven fast afterwards the martingale, that part of it which came between the legs, was made wide and padded.

Something over a year ago when studying the effect of the weights that the commonly accepted theory was wrong and that a contrary result would follow. For instance to take a rod, and set it swinging like a pendulum, whichever side the weight was placed there would follow a divergence from a vertical line, the bent being away from the weight, the center of gravity would be nearer the weight in order to equalize the sides. When the leg was in motion there would be an analogy between it and the pendulum, but then arose the question of overcoming the inertia and that might counteract the tendency to swing away from the weight. In order to give it a practical test I had a set of hind shoes made for X X, the inside web being double the outside and consequently twice the weight. Each shoe weighed eighteen ounces, twelve on the inside from the center of the toe back, to six ounces on the outer part. Riding behind him in a skeleton wagon before the shoes were put on and afterwards I thought that I could plainly see that he went wider. He wore these shoes from February 14th to March 30, 1882, and when pulled off that from the right foot weighed 15½ ounces, and the left 15 ounces. This difference in the wear was, doubtless, owing to an injury to the hock joint which made it a trifle stiff, and consequently there was more of a sliding motion, less hock action than in the other. The same day the shoes were removed I drove him to the track, and though he moved easier without the heavy hind shoes, it was perceptible that the feet were carried closer together. Before making this test I had a conversation with Hon. A. P. Whitney of Petaluma which arose from a question he asked. The query was: "What do you consider the proper method to follow when a horse brushes the outside of his forefoot in passing it with the hind?" The reply was that if he had asked the question a few weeks before I should have answered promptly: "use side-weights on the outside of his hind feet," but now I was in doubt of that being the right course. He then informed me that he had a horse which just grazed the forefoot, and following instructions he ap-

ied eide-weights. In place of "carrying him further out" as he was assured would he the result, he went eo much further in the opposite direction that he struck squarely into his heel and with so much force as to "knock him off hie feet."

The only other illustration apart from my own tests, was a test which John A. Goldsmitb made with Inca. He had the same views I formerly shared, and in a conversation last summer advocated the placing the weight on the outside. One of his "string" was the stallion Inca hy Woodford Mambrino, from the dam of Del Sur and Romero. He was a horse of peculiar action, twisting his fore feet outwards, and anything but a true-gaited trotter.

The sboes put on Inca weighed eleven ounces each, the inner side being wide enough to give twice the weight of metal, and with these there was a manifest improvement in his speed and manner of going. He had a record of 2:32, or about that, when Goldsmith got him, and after the change in his shoes he trotted at Santa Rosa in the 2:30 class, winning the first heat in 2:27, second to Albert W in the second heat in 2:27, and wou the third in 2:27¾, Albert W winning the race.

From Anteeo wearing the outside of his ehoe while the inner was scarcely bright, and also thinking the three-quarter shoe so much better for the hind foot, I nsed that pattern.

Becoming convinced, however, that the weight on the outside was inimical I had full hind shoes made, the onter side narrow and thick, the inner thin and wide, tbe object being to make the weigbt eqnal, and keep the foot as nearly level as possible dnring the period of wear. This did not make a perceptihle difference, and so I retnrned to the three-qnarter ehoe, covering the outside in order to have a rest for the heel strap of the scalping-hoot. With the steel coming on the inside there was eo little wear of the metal that in ten days or two weeks the foot wonld have quite a cant to the ontside. This was in a measure obviated by leaving the inner side bare, and I deemed it better to guard against a wrong twist than to obtain the sligbt benefit of weight on the inside. But after finding ont that a scalping-hoot conld be kept in place without the projecting heel I decided to put tips on behind as the only place he wore much of the metal away was at the toe and ahont half way back on the ontside, and a short distance hack of the toe on the inside. That part of the tip was made wider in order to eqnalize the weight, and they were set on Decemher 20th. While wearing tbese the only work he had was jogging on tbe road, driven by the man who takes care of him, and he reported that he handled himself better than in anything he had worn hefore. On the 18th of January I pulled off tbe hind tips, which were worn almost to an edge, put on front tips weighing three ounces each, and cut away his heels a good deal to bring them on a level with the tip. The hind feet were left bare and the edges ronnded. I moved him tbrongh the stretcb the next day, and he handled himself very well withont anything in the shape of boots. Since tben I have driven him occasionally, pntting on toe-weights of 3¾ onnces and quarter-boots, and restricting his fast work to brusbes throngh the stretch. The hind feet I keep level by cutting the inside every few days to correspond with the wear on the outer and being careful to ronnd the edges to guard against breaking. When wearing tips in front and three-quarter shoes behind, all the boots he reqnired were ankle and scalping boots; with the tips, toe-weighte and quarter-boots, and hind feet entirely bare, he reqnires shin boots with a speedy cnt attachment, and these he marke with the outside of the fore foot and occasionally bruehes the ontside of the quarter-hoot with the inside of the hind foot. Now what is the cause of tbis going wider behind I will not undertake to say with any degree of anthority. I think he is showing more speed than be did previously, as he hauled the cart through the etretch in thirty-eight seconds, and I only drove him at his best for about two hundred yards. Last summer the toe-weighte were detrimental, retarding his speed in the few trials I gave them. Now they are snrely an advantage or else it is the change in his disposition that must be credited with the improvement. As he has hecome less obstinate, more ready to go, with a willingness to trot from the start, there may he something more poteut than the weights to ascrihe the change to. At all events, the data are presented, and my readers can draw the inferences.

Yankee Ingenuity.—An ingenious Yankee has devised a method of heating a car and keeping it at an even temperature any desired length of time. It is intended to facilitate the transportation of fruit and vegetables during cold weather, and if it is a practical success it will he of importance to California in enabling her to send her orchard and garden products East at all times of the year. There recently arrived in Boston from Houlton, Maine, a distance of 520 miles, a car load of potatoes kept from freezing by this new contrivance. It ie called an antomatic heater, and by a simple but ingenioue application of the principle of contraction and expansion of metals with cold and heat the flamo or fire is regnlated according to the outside temperature. If it is cold outside the fire hurns more hriskly. Ae it grows warmer out of doors the fire burns lower, the neceseity for more heat being done away with.

A Genuine Bull-Puncher.—The real bnll-puncher is not the man who exhorte a procession of beeves along a country road, bnt he who jabs the tired animals in a freight car to keep tbem from lying down and being trampled to death by othera. Every cattle train has a lot of pnnchers armed with stont hickory etaffs ten feet long with a eharp brad in one end. With this they stir np the animals in the cars at every etopping place, to keep them from lying down.

HERD AND SWINE.

Ayrshires as Milkers.

Below we give the records of the herd of C. M. Wiuslow, Esq., Brandou, Vt., for the paet three years:

	Weight.	1881.	1882.	1883.	Average.
Lady Avona third	1,200 lbs.	5,834½	6,542¾	6,355½	6,247
Rosa	1,110 "	5,934¾	6,085	6,460	6,159
Avona	1,100 "	7,950	8,154	6,346½	7,483
Rosella	905 "	7,003½	6,162½	6,524½	6,563
Ruth	1,130 "	5,158	6,586¾	7,500	6,414
Rebecca	1,020 "	5,276	5,935	6,676½	5,962
Roxie	1,055 "	6,301	7,599	7,920	7,273

Average weight of cows 1,074 pounds; average weight of milk for three years, 6,586 pounds.

Queen of Ayr has a record of 8,404½ pounds average for six consecntive years after she was 10 years old.

Lilly Dale has a record of 8,984 pouuds in 366 days.

Two daughtere of Queen of Ayr have records of 10,426 and 10,801 ponnds.

At a trial in Scotland the winning cow yielded an average of 26 pounde 5 onnces of milk in each of teu successive milkings, and after being pnt in grass "improved wonderfully in the amonnt of produce. She lately gave the astonishing quantity of 75 imperial pounds or 7½ imperial gallous of milk per day for several days in snccession. The largest quantity at one milking was 39 pounds."

Mr. L. Swetson of Amherst, Mass., says: "I have a small Ayrshire cow whose live weight is but 860 ponnds, six years old, imported when a year old, which gave 300 pounds of milk in seven days—equal to her live weight in twenty days."

Jean Armonr, six years old, averaged 54 pounds per day in a ten-day trial. Greatest quantity in one day, 58 pounds. Her milk was set separately for three days, and the cream from it prodnced 6 ponnds 3 onnces of butter of the fiuest quality. Her weight was 967 pounds.

It is asserted on good anthority that the first Ayrshire cow imported by the Massacbusetts Society for the Promotion of Agriculture in 1837 yielded 16 pounds of bntter a week for several weeks in succession on grass feed only.

At a fair of the St. Lawrence Connty Agricultural Society three Ayrshire cows belonging to Edward M. Sbephard of Norfolk: The first cow, calved in May, yielded, the first week in July, 16 ponnds of butter or 2 ponnds 4 4-7 ounces per day. The second, calved June 20th, yielded first week in Jnly 14 pounds or 2 ponnds per day. The third, calved early in May, yielded first week in July, 15 pounds or 2 pounds 2 2-7 ounces per day. It was stated that these cows had nothing to eat but grass during the trial; that at the time of the trial there was a severe drouth prevailing in that place, and that the feed was very short in consequence of it.

Charles L. Flint, in his treatise on "Milch Cows and Dairy Farming," says: "The Ayrshire cow is said to assimilate or convert a larger proportion of her food into milk than any other breed of cows. So remarkable is this fact that all dairy farmers who have experience on this point agree in stating that an Ayrshire cow generally gives a larger return of milk for the food consumed than a cow of any other breed. They are pre-eminently a dairy hreed, surpassing all other breeds in the prodnction of rich milk and hutter on soils of medium fertility. The hest milkers I have ever known in the course of my ohservations were grade Ayrshires, larger in size than pnre bloods."

Dr. Geo. B. Loring of Salem, Mass., who keeps 90 cows on his farm for the pnrpose of selling milk, says that "since the introduction of Ayrshire cattle on his farm, the annual average yield of his herd has been one quart of milk per day, 365 qnarts per year more than it was previons to that time with the same keeping."

Ayrshires as Beef Cattle—Ada, an imported cow, was fattened, and her dressed weight was as follows: Beef, 882 pounds; tallow, 111 pounds; hide, 76 pounds; total, 1,009.

Edith Brown, a fonr-year-old cow, imported by Mr. Coutts of Mayfield, dressed 740 pounds.

Rilburn Lass, an old cow, also imported by Mr. Coutts, dressed 900 ponnds.

Minnie Gilpin, a two-year-old heifer, dressed 690 pounds.

The late Caleb W. Bement of Alhany, N. Y., a celcbrated breeder of thoroughbred cattle, and one of the first breeders of Berkshire hogs and Southdown sheep in this country, in a description of the Ayrshire cattle, describes them as "the Durhams in a smaller compass with increased milkiug facilities."

Orestes Pierce's Stock Farm.

On our way to the White mountains recently we met Mr. Orestes Pierce, of Boston, and received from him an invitation to visit his stock farm at East Baldwin, Me., on the line of the Portland & Ogdenshurg railroad. Availing ourselves of this privilege, we found ourselves taken from the station by a spanking pair of Knox colts, over a road which led through pine forests a distance of three miles, to Saddleback mountain, upon the southern slope of which the farm is situated. Mr. Pierce ie a gentleman of liheral cultnre, and though abandoning a professional career for that of a farmer, he snrrounds himself with hooks and pictures, and here in the country leads a life of ease and plenty which resembles that of an English country squire.

The buildings in their form aud finish, the stock of cattle and horses, and the land and fences bear the marks of a competent and carnest head. Jersey cattle are the chief tbonght, and we never saw their equal hefore; cowe costing thousands of dollars were as quietly munching their cuds as though they cost no more thau an ordinary animal. Great care is taken to insure their health by clean quarters, proper ventilation and good food. The herd numbers about one hundred and fifty, and in four years the loss by accideut or sickness has been but tbree in nnmber.

We were in season to see the milkiug; its cleanliness particularly struck us. Tbo milkers, men chosen hy reason of their disposition and ahility, put on special clothes and made their toilets ae for a great occasion. The milk paile were a novelty; they had covers on which the men sat while milking and there was a funnel and etrainer into which they milked, through which it was let into the side of the pail. Nothiug could be cleaner. As fast as a man filled his pail he weighed it, carried it to the end of tho harn and poured the milk into a large can through another strainer, thus doubling the precautiou for cleanliness. We followed that large can to the dairy where it was emptied into deep pans for setting, and in each case through not ouly another strainer but a doubled cloth in additiou. These caua wore put iu a tank of ice-cold water wbere they stay from ten to fourteen honrs; the cream is then taken off aud put into the cream pots to ripen before churning. Ripening cousists of aouring the cream alightly, in order to break the sack, which iucloses the glohnle of hutter, with less labor and dauger of injuring the grain of the hutter.

We did not have time to follow this particular can of milk through the various steps to butter, but we did see cream, which was sufficiently ripened, chnrned and mado into golden, fragrant hutter. Like all the ways of doing tbiugs at this farm, churning has its minute, careful details. When the cream was in the chnrn, the white-clad hntter maker who tested its temperaturo by a thermometer, told me he never started the churn nntil the temperature was right, and that he tested it several times during the operation. Jersey cream requires mnch less churning than that of other hreeds, aud to prevent injury to the quality of the hutter by its coming too quickly, the chnrn is revolved slowly. As soon as the particles of hutter make their appearance, the churn is stopped, wheu a little cold water is poured in to wash the hutter; the buttermilk is thus drained off aud the churn rocked gently to and fro, to gather the grains of hutter into a compact mass, it is then taken from the chnrn and put on a slate slab where it is pressed by wooden paddles until free from buttermilk, aud then salt is added. Only a small amount of ealt is nsed, ahout three ounces of salt to ten pounds of hutter. The salted butter is put iuto a cold room for eix or ten hours, when it is ready to he worked again and stamped. It ie put up in half-pound pats, each pat heing wrapped in a clotb, sixteen of these are pnt on a wooden tray and four of these trays fill a wooden chest; ice is put in the refrigerator which goes in the chest and the package sent under lock and key to Boston. One of these goes each day of the week. Each step of the making of this butter is attended hy the utmost cleanliness, and pure Jersey gilt edge is the resnlt.

Having watched the entire process of butter making we went back to the cattle. It is too much to undertake special mention of them by name, but we can say that this herd has been selected with great care to get large and persistent yielders. It sent eleven animals to the State fair last year, winning nine first, one second, one third and first preminms on the herd. A pretty good average! There is little demand in Maine for such fine costly animals, and the snrplns from hreeding is sold twice each year at auction in New York. The home, an old-fashioned brick mansion, is filled with all that makes life a pleasnre. We were well paid for stopping over. *Manchester (N. H.) Mirror and Farmer.*

William Child of Thetford, Vt., is a dairy farmer, keeping an average for the year of tweuty cows, which are largely thoroughbred Jerseys, whose excellence has heen tested hy the handsome yields of butter. His bntter record commences Jan. 1. In the year 1882 the butter product fell a little short of 5,000 ponnds. Included in his herd were a number of two and three-year-old heifers, and hence his dairy did not average npwards of seventeen full-grown cows, showing au average hutter yield of nearly 300 ponnds to the cow. He does not feed extravagantly, hut gives his animals two rations of hay per day, with four quarts of provender. He uses a creamer, churns twice or three times a week, gives the butter three thorough washings with cold water hefore it is taken ont of the churn, after which it is weighed, placed under the butter worker and again treated to another washing with water. It is finally salted at the rate of one-half onnce to the ponnd of butter. One teaspoonfnl of grauulated sugar is also added to each twenty-five pounds of hutter, and when sufficiently disseminated through the mass the butter is packed in five and ten-pound hoxes and forwarded by rail every Monday to a regular purchaser in Camhridge, Mass.

Sheep skins with wool on can be cured by this process: Take a teaspoonfnl of alum and two of saltpeter; pulverize and mix well; sprinkle tbe powder well on the flesh side of the skin and fold the skin with wool out and hang it in a dry place. In two or three days, or when dry, take it down and scrape with a blunt knife till clean and rub until supple. If to be colored, the wool should be well washed with soap and water, and dyed with any dye-stuff used for colored woolen goods. You can get the analine dyes of any desired color at the drug store, witb directions for using.

Humane Treatment of Horses.

Don't huild the manger so high as to make it unnatural, and therefore painful, for the horse to eat from it. Remember a horse is a grazing animal, constrncted to take food from the gronnd. When the head is down near the snrface of the earth the swallowing muscles are in position to do their work, but wheu the head is raised four or five feet high the muscles are restricted in their actiou. What is snpposed to be gained by mangers in the high neck and shonlders is more than lost in the depressed hack or "saddle back" of the horse iu consequence of the unnatural elevation of the head. The hottom of the feed box and manger should not he above the horse's knees, or what is better, never moro thau oue foot from the floor. The manger should be two feet deep—measuring from the top—and about two feet four inches wide at the top. Make the feed box at the bottom of the manger.

Make the floor of the stall level instead of desceuding from the mauger toward the rear, and use more and better absorhents. Iu so doing you not only save the most valuahle part of the fertilizing product of the horse, but you remove tho straiu of standing with his hind feet lower than the forward ones. When at rest in the pasture the horse chooses to stand with his forward feet lower thau his hind feet; this he does to throw the center of gravity uearer the fore legs aud shonlders, by which the projectiug head and neck are halanced by the rear portiou of the hody. Don't groom your horse while eating, especially while eatiug bis grain. If you douht the wisdom of this suggestion, try something similar on yonrself. While you are takiug your breakfast let some one shampoo your hair. You will either stop eating or stop the shampooing. It is an uuwiso practico to use either currycomb or hrush while tho horse is eating. Let him have hie food withont heiug disturbed. Meu do this foolish thing with the idea that it saves time. It might save time to drive the horse to his daily task without taking food at all. The horse wants clean food and driuk. Nothing is clean where a hen goes. Hens should be kept away from tho horses, not only from fouling their food, hut from communicating lice. These parasites are difficult to remove from horses wheu once upon them.

Don't work a horse all day upon the farm and at night turn him out to pick up a scanty supper wheu he should he resting in the stahle after eating. All that a horse demands for his service is rest, food aud drink, and he is cruel who denies these. There is economy in keeping a working team in the stablo at uight where it can be regularly fed, and is always ready for nse. Don't scrimp the allowauce of suitable food. All a horse needs of hay aud grain to keep in good coudition, it ia for the profit of his owuer to supply. One dollar saved in grain is two dollare lost iu work. Don't stuff a horse with hay and without corn or oats. Less fodder and more feed will be better for horso and owuer. Don't allow your horse to suffer with cold when a little repairing of the stable or blauketing will make him comfortable. The "hardeuing process" of making horses stand in cold without blankets is hard-hearted.—*Ex.*

San Francisco, Saturday, February 17, 1883.

SACRAMENTO AGENCY.

Residents of Sacramento and vicinity, desiring to subscribe, or advertise in the *Breeder and Sportsman*, can do so through our agent, Mr. M. J. Henley, Russ House 1009 J street.

CLOSING OF STAKES.

Do not forget that the stakes and purses of the Pacific Coast Blood Horse Association close on Thursday, March 1. See advertisement.

THE STATE FAIR PAVILION.

We are greatly pleased that the hill authorizing an appropriation of $40,000 has passed the House with the emphatic vote of forty-seven in its favor. There is so little question of the same success in the Senate that we are justified in considering the victory won, and that the same "solid sense" which led to a proper appreciation of the merits of the hill will prevail in the other chamber. It is a great hoon to the agricultural interests of the State, and though the benefit to Sacramento is apparent, for every dollar that it hrings to the capital one hundred or more will accrue to the whole people.

"Protection" to the agriculturist is one of the things which the average legislator gives little heed to. It is all very well when large manufacturers are to he made still wealthier, perfectly proper when a shipbuilder is to be insured an increased percentage, not a dollar of which finds its way into the pockets of his workmen; hut the tiller of the soil is ridiculed and made the hutt of every frothy would-he orator when he asks for a return for his share in paying the expenses of the government. His "brick-red wagons" are made to point a joke, although the point is only perceptible to the hugely humorous wag who perpetrates it, and a howl is raised at the desecration of the Capitol Park when it is proposed to erect a fitting temple upon it for the exhibition of the marvelous products of this State. With such a building as the one proposed to be erected, it will he the grandest show in the United States, and as beautiful as grand. The display of cereals, vegetables, fruits, etc., will he such as the whole country east of the Rocky mountains cannot equal. It may be that some of these objectors have arrived at such a high degree of culture that a table ornamented with the products of the orchard and garden is unsightly and offensive, and a collection of farm implements and machinery altogether too vulgar to suit their fastidious taste, but, fortunately, these are not the only people who have the guidance of public affairs, and men of larger brains come to the front. Farmers have been culpably negligent when their interests were at stake. There has been no concert of action, for if there had been, on such a plain proposition, so palpably just and so eminently proper, the hill would never have been in danger of even temporary defeat.

There is not a farmer from San Diego to Siskiyou and from the Coast line to the Eastern boundary of the State who has not an interest in extending the advantages of the California State Agricultural Society. If even he does not anticipate attending the annual fair, the lessons that are taught will reach him in some way. The waves of progress, though their centers be at Sacramento, will cause oscillations which will be seen hundreds of miles away, and though it may take time, the benefits are sure to follow. We hear of one Assemblyman who claimed that the people in his section had no interest in the State fair, and if he truthfully reflects their sentiments that section must have a preponderating lot of worthless members for any community to be burdened with. There must be the ignorance of the will fully blind, though it is a hundred to one that the man who entered the plea does not voice the views of his constituents, hut merely gives utterance to the fantasies of an imbecile mind. That section, so emphatically misrepresented, among other things is celebrated for its rich herbage. Where the hills and mountains are too steep for tillage they are clothed with a thick carpeting of the nutritious grasses indigenous to California. There are thousands upon thousands of sheep, herds of cattle. It is scarcely possible that there is a county in the State from which there is total absence of visitors, hut, granting that the statement of the honorable member is correct, from a contiguous shire there is one who has enterprise enough to learn what is going on in the outside world. He, too, has sheep and cattle and these accredited as the best of his neighborhood. He goes to the fair impressed with the belief that he will see none hetter. He returns a wiser and a happier man. He has secured a few rams, obtains a hull, and in a few years his fleeces have doubled in weight, and the butcher will pay him nearly twice as much for his steers. The news is bound to penetrate over the remote section where they are not interested in fairs, and his example bears good fruit. In course of time he learns another lesson. Reasoning that his halfbreds are so much superior, that must arise from possessing that portion of the superior blood, and hence halfbred coupled with halfbred will give the same proportion as the progeny of his imported sires. Though an improvement on his original stock, he finds that the standard is below that of the first generation, and as thinking has followed his efforts at improvement, it does not require much study to arrive at the correct conclusion. The sire's first get were the type of what he desired to rear. There were no contaminating influences. Their ancestors for generations had been of the same kind and on their side there could not be any "harking back," or reversions to inferiority. The halfbreds were liable to go either way and hence the difference, As soon as his mind was led into this chaunel there could only follow the deduction that there must be progression and that this could only he reached hy "breeding up." At his next visit to the fair he brings the benefit of enlightenment. He observes with a more critical eye. He compares with a keener intelligence and scrutinizes with better judgment. He is not satisfied with males alone. Determined to bring within his own resources the blood which has been found such a boon, he lays the foundation for a pure flock, a pure herd and ewes and a cow or two are bought. The wave reaches the section hemmed in between the mountains and the ocean and the swell from the banks of the Sacramento laves the distant shore.

This is only one illustration, one particular branch, and which could be extended through every department. As we stated in a previous article the agricultural exhibitors are the most potent educators of the whole people. The press has done wonders, valuable knowledge is obtained from books. Agricultural colleges and schools play a good part, hut to bring knowledge into a form that quickly educates, the fairs have the preference. Tangible, easily understood, within the comprehension of all, the lessons are so forcibly presented that they are stamped upon the brain with the intensity of realistic effect.

Those who justify their action against the hill on the score of economy may he pardoned, as "watchdogs of the treasury" are in a commendable attitude, and the guarding of the public till is praiseworthy. But when the outlay is so perceptibly for the benefit of the public, when it is so palpably conducive of the general weal, it argues a short-sighted parsimony in place of business ability. Were it a scheme for individual aggrandizement, a job to give fat offices to hangers-on of the party, there would he some show of good sense in strenuous opposition. It cannot be a valid ground of objection that Sacramento is to gain some slight benefit from the expenditure as that view would have the same hearing on any project where anything of a like nature was proposed. It does not have a bearing of the weight of a feather on the question, and is so eminently absurd that space will not be wasted in answering so frivolous an objection. There can only be one objection raised, and that is: Will it pay? We are firm in the belief that the direct results will be to recoup the State in a very few years, hy the addition of taxable property, and that indirectly it will add millions for the few thousands granted. Those who oppose the passage of the hill on the score of economy must either have a limited knowledge of the effects of agricultural exhibitions in enhancing the prosperity of the State, or else they are desirous of making a parade of a virtue that is foreign to their character. That is, a number of those who base their objections from an economical point of view.

We have no desire to make comparisons, and still less to underrate the importance of sustaining a corps of "citizen soldiers" always ready to protect should occasion demand. To cripple the National Guard from a penurious desire to cut down expenses, in our opinion, is not a wise movement; to hamper the State Agricultural Society hy restricting them to quarters so grossly inadequate to the wants is a miserly withholding of assistance which should be given.

THE CHICAGO STAKES.

In the appropriate column will he found the advertisement of Totting-Colt Stakes to be decided on the Chicago Driving Park in the summer meetings of 1883 and 1884. As full particulars are given in the advertisement there is no necessity for repeating them, though we are extremely anxious to impress California breeders with the importance of making nominations in these stakes. It is apparent to anyone who has a particle of discernment that a market outside of this coast and other lands on the Pacific must he secured or the breeding of trotters will have to he curtailed from even the present proportions, not to take into consideration the prospective increase.

The sooner an animal can be sold for a remunerative price the more profit there is to the breeder. The chance to sell when the colts are young has been and is the protection of the breeder of thoroughbreds, and were it not for the yearling sales, the larger breeding establishments would he compelled to close, or, at least, diminish the number of broodmares.

The stakes for two and three-year-olds are the cause for the demand, and were these to he abolished, thoroughbred yearlings would not bring one quarter of the price that is now realized. Trotting-colt stakes open a wider field than those on the turf. Racing is the first object, and then the purchaser has in view future broodmares, and occasionally a stallion for stud purposes. There is little expectation, however, beyond racing and the paddocks, for a few saddle-horses, and at rare intervals a harness animal, are all that can be looked for. Were thoroughbreds broken to harness when young, it would he different, though owing to the almost universal prejudice against this course it will be some years hence when the practice is adopted.

With trotting colts it is entirely different. The road absorbs the far larger number, and this destination gives a value which makes the business safer and decreases the risks of failures. Engagements in Eastern stakes are the surest method of enhancing the value of the colts that are named. It is a token that the breeder is sincere in his belief that the animals he breeds are of a quality that he is not afraid to meet others, and no amount of talk or denunciations of early training will make amends. Purchasers readily see through the causes for this sort of reasoning, and turn away from those who do not "show something" or make manifest their belief hy taking the steps to bring their stock out. There is not a shadow of doubt of the increase of value arising from "good engagements." To illustrate, we will take the Ashland Stakes for 1884; that is, for foals of 1881. There should be at least thirty nominations from California in this stake, as the only risk is the nominating fee of $10, which is all the payment required until the 1st of January, 1884. Of that number it is likely that twelve or more will trot in the home stakes this fall.

From the showing that the yearlings that trotted in public made the past season, and the known excellence of those which did not, this is, doubtless, below the mark. There is also a great probability that faster time will he made hy this class here than is recorded in the East, and those which are engaged there, and which show well here, will be sought for. This will not be confined to the home winners, as any colt that gives evidence of improvement will induce buyers to look after it when they would not think of purchasing in other circumstances. With thirty California nominations in the Ashland Stake of 1884, we will be disappointed if there are not at least five of them good enough to make the trip, and with this number we would not be entirely overcome if first, second and third money fell to the lot of the Pacific Coast nominees. Sanguine as this estimate is we will wager a plug hat, pair of driving gloves or something that does not cost more than the nominating fee, that irrespective of the number of California colts engaged, California and Kentucky will "scoop" the whole thing.

We have no desire to discourage the breeders of other states, and should they realize the importance of early care and early training in time, they might stand a fair chance, but as we feel "more than certain" that the winner will prove a colt which was trained in its yearling form, 1884 is too closely at hand to remedy past errors.

When the only risk is $10, that amount carrying the "privilege" to the first of January, 1884, breeders "cannot afford" to let the opportunity pass hy, and we sincerely hope that there will be a response which will sustain us in the predictions made.

The Ashland Stakes for 1883 are not so likely to elicit nominations. There are a number of promising colts of the right age, though the time of trotting is too close at hand to make the necessary preparations. But the four-year-old stakes, especially that for 1884, should receive a good support from our breeders.

THE NEW YORK "SPIRIT" ON THE BOXING CRAZE.

In the athletic column is copied an article from the New York *Spirit of the Times*, with the sentiments of which we cordially agree. The prominence that was given to the brutal sport by the turf papers of half a century ago, has been an incubus that even fifty years have not entirely removed. The sports of the turf, the track, the field and legitimate athletics have been associated with the ring and the pit, and thousands at the present day regard them as of something the same character, or at least, under the supervision of the same class of men. We go so far that we would gladly see the gloves, no matter how soft, banished from the gymnasiums, and nothing left which had the odor of the ring to nauseate. There are other exercises that will be as advantageous for physical development as boxing, and without the vulgar associations that are so intimately linked with the "manly art." The plea urged that it enables a man to defend himself from wanton assault is without a logical foundation as a rough never waits to learn whether the party assailed is a disciple of Tom Cribb or not, and in many, perhaps a majority of cases, the rounder of the wharves and low saloons is a more finished pugilist than the club member. In such a case a stout walking stick, and some practice in handling it, is more efficacious than the best trained fists, and if it is compulsory to be thrown into company where protection is needed, the revolver can discount clubs or knuckles. The only reason that can be given for instructions in boxing is that it teaches the pupil a better manner of fighting with his hands. As a means of exercising there is no necessity, as there are plenty of other methods of using the muscles that are equally efficacious.

That boxing has a tendency to aggravate a quarrelsome disposition is a natural sequence, and the young man who has acquired proficiency with the gloves is anxious to have a chance to distinguish himself without the encumberment.

Confident in his prowess he is apt to be "hunting a fight," and if victorious in the first essays is almost sure to degenerate into a brawling ruffian. If of a hot-headed temperament this is almost sure to be the result, and though a large majority of those composing the amateur athletic clubs of this country are too firmly supported by genteel instincts to lose their balance, their are some who do not have this essential backing to save them.

It is not likely to impress the public with a favorable opinion of this course of education when young men, moving in good society, will join in a public exhibition with a man who has repeatedly broken the laws and another who comes to this country with the avowed determination also to offend.

Horse-racing, trotting, shooting, fishing, athletic sports, yachting, etc., are amusements which receive the support of the good and the true in every civilized country, and when conducted properly, are only objected to by those who are too bigoted to see good in anything save the narrow rut in which they move.

That the papers of this country, which are so closely identified with these great interests, have taken such a decided position in denouncing the low and demoralizing exhibitions is truly gratifying to every one who cherishes a fondness for the invigorating sports. There is no affinity between these fascinating and legitimate pastimes and the prize-ring, boxing matches or other sports which pander to a depraved taste, and if at one time associated, the separation is a token that a higher standard has been reached.

EQUINE DENTISTRY.

Although there have been many and valnable new methods adopted in the last twenty years in stable management we doubt if any one thing has proved more advantageous than an intelligent care of the teeth of the horse. This has not been limited to euperior instruments, though there is a wide difference in this respect, as men have studied for the profession with the same attention as those who practice on mankind, but they have entered into the pursuit with more enthusiasm, and follow it with heartier zeal. Then there are more of a variety of things to remedy. In man there might be a trifle of roughness which never gave trouble, but if there were something to press his cheeks together or force his tongue against the serrated edge and hold it there, he would have a better understanding of the acute suffering a horse has to bear from apparently trifling causes. We were led to this train of thought from watching Prof. Woodruff operate on two horses a few days ago. One was Anteeo, and we were satisfied that something was the matter from the way he twisted his head about at times and of the foaming at the mouth and drewling. Not caring to risk a hand as far back as the furthest grinder our examination failed to discover the cause. The Professor in short order pulled out the remnant of a masticator of the first dentition, and it was plain that the acutely pointed, jagged thing was enough to give serious trouble. The other was a six-year-old gelding, and when the spectrum was placed in his mouth, and the opportunity given to see and feel, it was not at all surprising that he should pull and toss his head about and pick up his food daintily. In old times "the float" would have been called into requisition, and its coarse teeth done more injury than the original trouble, but with the better-contrived instruments, the sharp projections were ground away so carefully that the horse appeared to understand the object and appreciate the intention by remaining quiet after the operation was fairly commenced. There is a marked change not only in the driving more pleasantly, as he goes at his rations with an eagerness and can masticate the hay and oats fearlessly.

THE AUCTION OF TROTTING STOCK.

As has been stated before, the auction sale of trotting stock belonging to the estate of the late Daniel Cook will take place at the Oakland Trotting Park on Wednesday next, the 28th inst. In giving an account of the animals offered one main feature pertaining to the colts was omitted. That is, that a number of them are named in Stakes, Embryo, Occident, and one in the Stanford of 1884, which adds greatly to their value. The sale again being on the last day of this month gives the opportunity to name in the Chicago Stakes, the nominations to which close on the 1st of March, and according to the present rules a letter postmarked on the day of closing will be valid. There is little necessity for amplifying on the added value that follows being named in the stakes, and also the chance for entering into engagements as valuable as those in Chicago. The catalogues, which can be obtained of Killip & Co., and on the ground the day of the sale, show the colts that are engaged and the stakes they are in. There is scarcely a question that great bargains will repay those who purchase, and that of colts as highly bred as there are in any country.

THE RIFLE.

C and G's Shoot.

Sunday, Feb. 11, Companies C and G, First Infantry Regiment, N. G. C., held their monthly shootiug at Shell Mound Park. The morniug broke cloudy and as mauy thonght it would rain before noon the attendance was not as large as it ought to have beeu. As stated iu last week's issue the members of these two companies are divided into four classes according to their ability as marksmen. It is the intention to keep up these monthly contests in order to bring the poorer shots and those who have had no experience in the use of firearms to the front as marksmen. Many of the younger members before last Sunday were almost entirely ignorant of how to aim or fire their pieces correctly. This ignorance was particularly noticeable among the third and fourth class men. It is said that it is safe to stand anywhere but four feet to the left of a woman when ehe is trying to throw a bottle at a chicken or any other object, and this eaying might be applied to embryo riflemen; it is safer to stand at the target than anywhere else. The older shooters were as cool as need be and shot with as much indifference as one would light a cigar, but many of the younger ones were "as nervous as a maiden with her first sweetheart" and the mistakes they made were quite amusing. One youthful shot snapped twice at the target before he discovered that he had put an empty shell into the rifle. Another picked up a rifle that had the elevation of the sight at 200 yards and shot two cartridges at the 100-yard target aud could not tell why it was that marker waved the red disc across the target instead of marking a hullseye; a little splash of water away up the bay told where the bullet went. Another little mistake, though perhaps uot to be wondered at, was made: A number of long Springfield rifles were standing against the bench; close to these etood a member of the range committee—a very long and a very, veryslim man he ie—and by mistake a nervous marksman picked up the range committeeman but the mistake was discovered before the loading process commenced.

One of the best shots came so near hitting the target as to tear off a large sliver from the bulkhead, driving it throngh the target, somewhat to the discomfiture of the marker.

But to throw noneense aside and give each and all his just dne, we can conscientiously say, that taking into consideration the uncertainty of the light, the inexperience of several of the marksmen and other drawbacks, the scores made were very good and deserviug of notice and commeudation, and they will without doubt, as a body, ehow by their scores a better per centage in shooting than any other hody of militia men in the State. Followiug are the classes, marksmen and scores. The first class shot 200 and 500 yards and have taken a great many prizes in contests with other bodies of riflemen:

FIRST CLASS, 200 YARDS.

Sime	4	4	5	5	5	4	4	5	5—46	
Cummings	5	5	4	4	4	4	4	4	5	4—43
Klein	4	4	5	S	S	4	4	5	5	5—42
Kelly	4	4	4	5	4	4	4	4	4	4—41

FIVE HUNDRED YARDS.

									Total	Grand Total
Sime	5	4	5	5	4	4	5	4	5	5—46	92
Cummings	3	5	5	5	4	5	5	4	5	5—46	89
Klein	5	5	5	5	3	3	5	4	4	5—44	86
Kelly	3	3	4	4	5	5	5	5	5	5—44	85

SECOND CLASS, 200 AND 500 YARDS.

										Total
Burmeister	3	5	4	3	3	4	4	4	4	4—38
Thompsod	4	3	4	S	3	4	4	S	5	3—36
Maj. Klose	3	3	5	5	4	4	4	4	4	4—40

Elder, 37; Kremple, 33.

FIVE HUNDRED YARDS.

									Total	Grand Total
Burmeister	5	3	4	5	4	3	5	4	5	4—42	80
Thompsou	5	4	5	4	4	4	4	3	4	4—41	77
Maj. Klose	0	2	0	4	3	5	2	S	4	5—28	68
Elder										18	55
Kremple										17	50

THIRD CLASS, 200 YARDS, TEN SHOTS, POSSIBLE 50.

White	39	Palmer	33
Johnsod	32	Davis	31
Munson	30	Ganzert	29
Bradbury	28	English	21
H. Clide	19		

FOURTH CLASS, 100 YARDS, 10 SHOTS, POSSIBLE 50.

Ruddock	39	Whitidg	39
Campbell, J. T.	35	Dudnigad	18

Shell Mound, Feb. 11.

Last Sunday the match came off at Shell Monnd Park in which Chas. Thierbach and Lieut. H. J. Maugels shot against L. Haake and O. Lamke for a purse of $25. This contest resulted in the victory of the first-named shots by five points. The day was clondy aud the light varying and rather uncertain; it was just such a light that makes a target appear, eveu in the hrief space of five minutee, at different dietances, often obligiug the marksmen to change the elevatiou of their sights quite frequently. This change from shade to light and vice versa is very annoying. Following are the scores:

Chas. Thierbach	4	4	4	3	4	4	5	5	5	4—42	166
	4	4	4	4	4	5	5	4	4	5—43	
	3	5	5	4	4	3	4	4	5	5—42	
	3	4	4	3	4	4	4	4	4	5—39	
Lieut. Mangels	4	4	4	4	4	5	4	4	4	5—42	170
	4	4	4	5	4	5	5	4	4	4—43	
	5	5	4	4	4	4	4	5	4	4—43	
	3	5	5	4	4	4	5	4	4	4—42	
L. Haake	3	5	4	3	5	4	4	3	3	4—38	160
	4	4	4	4	4	4	5	4	4	4—41	
	4	4	4	4	5	4	4	4	3	4—40	
	4	4	4	4	4	4	4	4	4	4—40	
O. Lemke	4	3	4	4	4	5	4	4	5	5—42	169
	4	5	5	4	4	5	5	4	4	5—45	
	4	4	4	4	4	4	5	4	5	4—42	
	4	4	4	4	4	4	4	4	4	4—40	

As the above scores show, the shooting of these four conteetants was very close together. After the principal match several smaller matches were shot off. Mr. Dnnker officiated as score keeper.

To Europe.—Lieut. Fred Knhnle of Petaluma, one of California's crack rifle shots, is about to start for Europe to attend the shooting tournaments held in Germany and Switzerland. The prizes given by these two governments are elegant in design and valuable and they attract the first-clase shots from all parts of the world. There is some talk that Philo Jacohy will accompany Mr. Kuhnle. Mr. Jacoby has been across the pond before and brought back a great many medals and prizes as a proof of his success as a sharp-shooter. The departure will not be made till after the spring meetiug of the California Rifle Association, which will take place iu May. These gentlemen will take with them onr best wishes, and those of their many friends, for their snccess.

Declared Off.—The Linville-Brown rifle match that was to take place at Shell Mound Park last Sunday was a fizzle owing to the non-come-upment of Mr. Brown with his part of the money. The purse was to be $100 a side and Linville's money was placed in reliable hands but we have not heard yet whether it was sickness, increase in the family or a faiut heart that prevented the other $100 being put up also and the match shot. Sufficient to say the match is declared off.

YACHTING.

One of the handsomest plnngers yet built on this bay was launched by George Farmer of Oakland last week for Mr. Henry Eckley of Carquinez Straits. She is 25 feet long, 9 feet beam, 2 feet 6 inches deep aud draws 22 inches of water. The sail has 22 feet hoist, 7 feet gaff and 29 feet foot. The deck, which is quite long, is cauvased. The open cockpit is 11 feet long. A small hatch is abaft the cockpit by which access is had to the overhang where stowage can be made. A peculiarity in the boat is that hlocks of wood are fitted between the frames under the flow to serve as ballast. They only come up to the bilge. Some iron ballast will also be used. The spars are selected wood and altogether the little yacht is quite a creditable job, the sheer being graceful and the whole boat lookiug like a New York huilt one.

The coming season ought to be a lively one as there are six or seven new yachts to be added to the local fleet. These are: Mr. Tevis' new 80-foot yacht; Spreckels Bros.' 80-foot one; the 40-foot one being built hy Stone; the 40-foot one being by Farmer of Oakland; Purvis' 40-foot schooner jnst lauched; the 25-foot periagua-rigged one, being built on Mission rock; and possibly a 36-foot one for a gentleman at Carquinez straits. This makes more new yachts than we ever had for any one season since yachting commenced here.

A meeting of yachtsmen was held thie week at the Palace Hotel to couisder the yachtiug interests of San Francisco aud vicinity aud to evolve some plan for enlivening matters here next season. The conclnsions are not yet annouuced. Witli such a fine sheet of water as we have and such a good fleet of yachts, there onght to be no lack of interest in the sport.

At the annual meetiug of the New York Yacht Club held last week a committee was appointed to consider the advisability of adopting the iuternational code of signals in place of the private code now in use. Also a committee to coufer with other yacht clubs in regard to adopting an improved plan of measnrement.

The finishing touches are heing put on the Lurline. She is to go to Saucelito wheu her decks will he planed and she will be given her final coats of paint. The cabiu work ie completed. A trial trip will be made hefore long.

Laflin's sloop Bessie, which was huilt in Oaklaud uot long since, has been sold to go into the fishing trade.

A catamaran has lately sailed from New York to Florida. She went by canal, sonnd aud river.

A sixty-foot eharpie has successfully made the ocean voyage from New York to Florida.

The boys who had the Lillie last year think of [illegible] emaller yacht this seasou.

ANCIENT AND MODERN ARMS.

The Manner in which Difference in Caliber Influences the Turn of the Rifling.

BY DR. E. H. PARDEE.—NO. 11.

In the further consideration of the influence of the caliber on the turn and the effect of the rotary velocity necessitated for shots of different diameters, an important consideration must not be overlooked, and that is the projectile and rotary movements of the shot are entirely separate and distinct from each other, and that whenever the velocity of progression is constant the rotation will vary in accordance with the length given to the turn of rifling. And from this position it must be evident that the proper degree of angular velocity for maintaining the equilibrium and stability of the projectile of a given form and size will not be the same for a shot of a different size, since the conditions alter with the size and form.

But the size of the shot may differ, the resistance of the air to its progressive movement must always be in the same ratio, not only to the surface of the square of the velocity, but also to the *vis viva* of the shot.

When we take in consideration the velocities of the explosive fluids is the resistance of that aeriform fluid filling all space, it is but safe to calculate that in a vacuum matter in motion would be a long time in coming to a rest, as there would be no resistance to overcome the *vis viva* of the working power of the moving body, for we find in the grand laboratory of nature that arrangements simple in all its parts have been made so that one element can control another.

And in taking a retrospective view I can think of nothing more wonderful in the vast catalogue of nature's arcana, than that in which we move, live and have our existence. The belt of atmosphere supposed to be four miles high, surrounding our earth, giving life and vitality to every animate being on the face of the whole earth. In no other portion of nature's work is anything more wonderful than the belt of atmosphere sorrounding this terrestrial sphere. Its action on moving bodies is of so extensive a nature that to become conversant with even the fundamental laws of gunnery it is necessary to study its density and its constant aim to resist the passage of moving bodies.

The resistance of the atmosphere is in proportion to the velocity of the attempt to displace; the higher that velocity becomes the greater must be the resistance. The above proposition is fully carried out by the action of all the fulminates. One can take a small quantity of the fulminate of silver, and cause it to be exploded on a strong copper plate which will perforate it as completely as would a cannon ball while traveling at the velocity of 3,000 feet per second.

Wherever space exists within the belt of atmosphere surrounding the earth's surface, that space under ordinary circumstances is occupied by air, and one of the principal modes in which atmospheric resistance, with projectile force, is due to the columnar form it assumes in the cabbers of all descriptiens of gunning. If the propellant force of gunpowder be as great as I have described it to be in some former communication, we may well feel astonished at the immense force exerted on a gun barrel at the discharge of a common charge of gunpowder, in expelling the column of atmosphere from the caliber of the gun. If the length of the gun barrel be thirty-eight inches, then will the displacement require a force capable of condensing thirty-eight atmospheres into one, or nearly 860 pounds, providing the caliber be 50-100 of an inch, this too without estimating the side or lateral pressure, which may be safely estimated at one-third more. But it must give way, and that, too, quickly, notwithstanding the column of air is using its power to hold the shot in its state of rest, but the propellant force of the gas, generated from the inflamed gunpowder, possessing the greater power, the shot begins to move against the particles of atmosphere, lying in juxtaposition to the forward end of the shot, and those particles against other particles, until the whole atmospheric column begins to move for the helligerent bullet to pass to the open and unconfined air.

What a relief it must have been for that bullet when it passed beyond the confines of its imprisoned condition, followed by a lapping flame of maddened fire, like the fiery serpent described by Pollck in his "Course of Time," tormenting the souls of sinners in the lake of brimstone fire:

> Original the being seemed, but fallen
> And worn and wasted with enormous woe,
> And still around the everlasting lance
> It writhed, convulsed, and uttered mimic groans,
> And tried, and wished, and ever tried and wished
> To get away.

I have many times congratulated myself, over the frozen reality, in knowing that I am not a poor little bullet, and at any time he subject to the band of some devoted Nimrod, or some enthusiastic cuss, who dreams of bullseys and hair triggers in the stilly hours of night, and chucked in the stern of some breech loading rifle, and be sacrificed at any time and sent spinning through the air like some tailless comet, neither asking consent or even giving notice, Mr. Bullet, are you ready.

The bullet has a hard time of it, placed between counter pressure, and is squeezed until it changes shape, so that if it was sentient it would be incapable of self recognition, and I have no doubt that if it could speak, the first thing it would say after its flight, "cursed be the man that invented gunpowder." But if I was a bullet I surely would like to be consulted in regard to the rotary velocity that I would be expected to participate in in my swing through the air for I must confess that it makes a little difference with me which side is up, for I always had a boyish desire to be on top more than one-half the time, and now if the spirit of Old Zoller, or some of the shooting stars of the Pacific Coast, will intimate to me through the columns of the BREEDER AND SPORTSMAN how the diameter of a gun could so influence the turn of the rifling, as to impart to the shot a rotary velocity that one side would be up the greater part of the time I will then take the matter under consideration regarding the metamorphosis necessary to be changed into a bullet, for both theory and practice demonstrate the important fact that when properly cared for it is a good and confiding servant, but when turned against you a hard master. It is musical beyond all comparison, its low demi-semi-quavers are like the vibrations of the semi-transparent wing of the white hornet, and when one instinctively feels the wave of the air giving him warning of its close fellowship, his nervous system at first begins to appreciate the philosophical meeting of two objects, and the idea will come to him, quick as the wink of your eye, that no two substances can occupy the same space at the same time; then the hair on the head will begin to crack and stiffen up like hoe-handles, and without any regard to the order in which one moves his pedal extremities will begin to act and, put the brakes on as hard as you will, it is impossible to keep still. He gets pale around the mouth; he has a sensation about the epigastrium as though he wanted to puke; he feels that there is a possibility of this little toy coming in contact with his belly, and in its friendly greeting stir up the bacon and eggs that lie unassimilated in that organ, and leave a little cul de sac for the rays of the sun to follow. But these religiously inclined feelings only last for a moment, when the little joker passes you, and leaves one in the deep solitude of his own thoughts. But, Mr. Editor, if one should be disemboweled, and left by the wayside to soliloquize over his unfortunate condition, he would naturally study the cause, "on the manner in which a difference in the caliber influences the turn of the rifle" that sent the bullet. He would argue that when the initial velocity is constant, the resistance of the air from the smallness of its surface as compared with its weight is comparatively smaller upon a large shot when it first leaves the gun, yet the retarding force of the air upon it during its whole flight must depend upon the *vis viva* or relative quantity of work accumulated in the shot, at the instant when it leaves the gun. Therefore, it will only remain to ascertain the real angular velocity or length of turn necessary to secure the shot of different sizes the same relative amount of *vis viva* in their rotation as in their progressive motion.

To make myself more clearly understood upon this question, of so much importance to a law quite well defined, but not clearly regulated by well established deductions of a practical nature, but well supported by theory in the laws of dynamics, let us suppose the same initial velocity to be used, and the *vis viva* of translation, therefore, to be relatively the same for each shot; if the length of the turn remain constant, the angular velocity must be the same, however large the diameter of the shot, but the *vis viva* of rotation will differ with the diameter; for instance, in a shot twice the diameter of another in size, the *vis viva* of rotation must, in obedience to the established laws which govern rotating bodies, be in the proportion of sixteen to one, or relatively twice as great, and therefore would be greater than required.

If, on the other hand, the turn will be of a length in proportion to the real diameter of the shot, the angular velocity will then be reduced one-half; that is to say, the larger shot will make only one rotation in the same space of time in which the smaller revolves twice; but the *vis viva* of rotation will be in the proportion of four to one only, or relatively one-half that of the smaller, which is really less than is necessary.

In carrying this problem to a satisfactory result, we will find that relatively twice the *vis viva* of rotation is produced in a shot twice the diameter of another by the same angular velocity, and that relatively one-half only is produced by half the angular velocity; it must follow that, to produce relatively the same *vis viva* of rotation, the square (mind you, the square of the angular velocity not the velocity) must be one-half less in the larger shot. This theory is most clearly established by Professor Enler in his philosophical deductions in reference to the laws of dynamics, and which will hold good in the establishment of the proposition now before me. He says: "Bodies of the same density and form, projected with the same elevations, and with velocities as the square root of their diameters, will describe similar curves, as the resistance will be in the ratio of their quantities of motion," a philosophical proposition so well put that it proves that if the resistance of the air varies, as the square of the velocity, it is also in the ratio of the relative *vis viva* of the shot.

The man by the wayside comes to the conclusion that he has been shot in accordance with the most approved style of caliber, which influenced the turn of the twist in the most scientific manner, and he was willing to close his eyes and die like a "soldier, with his martial cloak around him."

Incubation of German Carp's Eggs.

Much difference of opinion exists as to the period of incubation of the eggs of the German carp, and the following from the annual report of Dr. H. H. Cary, of LaGrange, superintendent of fisheries in the State of Georgia, will throw some light on the subject: "I have been very desirous of ascertaining the precise time of hatching of the carp eggs in our latitude, as numerous inquiries have been propounded to me on that subject. Dr. Rudolph Hessel, a German fish culturist, and the superintendent of the carp ponds at Washington, states in the report of the Commissioner of Fish and Fisheries, part 4, 1875-6, that they hatch in from twelve to sixteen days. I was impressed that they would hatch much sooner here. Mr. Emanuel Heyser, of Madison, Ga., an enthusiastic fish culturist, a careful observer and reliable gentleman, has given me the benefit of a careful experiment made during the present year, and as I regard this experiment as very important, I beg leave to detail it somewhat fully. On Friday, May 12, 1882, he had three scale carp taken from his pond with hook and line, two females and one male, weighing about three and a half pounds each. On Saturday, May 13, he placed them in the bed of a spring branch, running through the bottom of an old pond that had been dry for about four years and was overgrown with grasses, rushes and weeds—except the little spring branch in the center. On the following Monday, the 15th, he had the breach in the dam of the old pond closed, and the water gradually spread over the surface of the pond. On Wednesday following, May 17, Mr. Heyser noticed the carp were spawning in water, and not over six inches deep, and the water was so clear he could readily observe every movement of the fish. On Thursday, the 18th, and Friday, the 19th, he gathered eggs from where he had seen the carp spawning, deposited on grass, weeds, etc.; some of these eggs were placed in a glass vase and some in a tin bucket, both filled with clear water. The vase he kept in his dwelling house; the bucket he placed on the branch of a tree in open air, six feet from the ground, These remained undisturbed until Tuesday morning, May 23, when he found that in both the bucket and vase, the eggs were hatching. On making this discovery he went immediately to the pond from which the eggs were taken, and with a basin could dip up large numbers of tiny fish. That they were scale carp he was certain, as he kept watch of them for about a month, when they had attained a length of one and a half inches. That the young fish were hatched in from five to six days there can be no mistake, as there was no water where he gathered the eggs until less than a week before he saw the young fish, and it had just risen sufficiently deep to allow the fish to swim around in spawning. Mr. Heyser, having no thermometer, had no means of ascertaining the temperature of the water at the time, but by reference to my register I find the average temperature of the atmosphere in the shade was on the days covering this experiment 69.1 degrees, but as Madison is about one-half degree north of LaGrange, the temperature might be a little lower, and this would approximately indicate the temperature of the water, so that we may assume with the temperature of the water at about 60 degrees, these eggs were hatched in from five to six days."

POULTRY.

Modern Artificial Hatching and Hatching Apparatus.

EDITOR BREEDER AND SPORTSMAN: What knowledge I may possess of this subject, which you have so kindly requested me to present to your readers, was derived in only a small measure from the experience of others. My investigations have been prosecuted practically in the conduct of the Brooklyn Broiler Farm, where I have hatched many thousands of chickens artificially, extending over a period of nearly three seasons. Had the theories and instructions of others been of as tangible value as I was led to suppose they were at first, my experiences in hatching would have been attended with far less trouble, expense and disaster, I can assure you, and there would have been slight occasion for giving the public the results of my study of a subject thoroughly understood by many, seemingly, and of little novelty to poultry people. Before engaging in the business I had looked into the subject as thoroughly as I was able with the sources of information at hand; but unfortunately for me, and unfortunately for all who fall into the bands of certain "incubator" Philistines (I mean the sellers of many of the contrivances being foisted upon the public ostensibly for the purpose of artificial incubation), most of the authorities I stumbled upon were deficient in knowledge of practical incubation, were more or less interested in selling machines, and had thriftily prepared spurious instructions, supposed to have been based on extended experience. Should a small vein of bitterness accidentally show itself in some portions of what I may write, you will understand from the above how to account for it. I am bound to exonerate certain gentlemen from blame in this connection, whom I agree with perfectly on some points, but with whom I take serious though kindly issue on others. I may thoroughly respect the man who is mistaken, though he has unintentionally misled me without motive. I thoroughly and invariably despise one who so far forgets his manhood as to take advantage of another's ignorance in the manner above indicated. Should I err in any matter, I ask the indulgence of the former class—I owe the latter nothing.

I shall endeavor to avoid technical scientific problems and theories so far as may be consistent with a clear presentation of the subject, but will not hesitate to delve into the "whys and wherefores" of any matter I deem it of importance that one should know to practically prosecute artificial incubation.

There is a certain charm about the "chicken business" which induces numbers to engage in it annually, and the exhibition of numerous hatching devices at our fairs has caused a still greater interest and inquiry, especially in regard to the particular subject I write of; this must be my justification for what might appear to some to be unwarranted detail and length. Respectfully yours, G. E. D.

Part I.—The Hen's Method.

While it is appropriate to state at the outset that artificial incubation has never been and never can be a perfect imitation of nature in all points, it is insisted that in some things it is not only desirable but imperatively necessary to copy her closely. To illustrate: The early modern investigators of the subject spent years of fruitless endeavor to accomplish hatching by means of contact heat, like that a hen gives eggs from her body. Rubber bags, containing heated water, laid upon the eggs; pipes through which heated water circulated, and all manner of devices were placed over and upon the eggs. Failing in this way of applying contact heat, it was placed under and on the eggs; they were buried in heated sand, etc., with no better results. In a word, application of heat artificially, by contact, failed signally. I will leave consideration of the causes which led to these uniform failures to its appropriate place. But as I have said, it is necessary to follow nature in many important matters, and I deem it desirable to outline the prominent features of natural hatching, especially for the benefit of novices. When a hen has sat on eggs, say, four or five days, if we have a good egg-tester* we can easily discover, if the eggs is fertile and the shell is transparent enough, the embryotic chicken (The shells of eggs vary greatly in transparency. Some are so nearly opaque that we can scarcely examine the interior at all, even with the best tester). If the egg be not fertile, yet fresh when set, it will still be perfectly clear, except a faint cloud we may discover, which is the yolk. If it be imperfectly impregnated, a trace of the embryo can usually be seen, but generally dead. Often a red circle or semi-circle will be discovered. This is formed from the ruptured blood-vessels of the dead embryo, and will soon turn black. A clear or infertile egg may remain under a hen for a long time without the slightest change for the worse, but if an egg is poorly fecundated and the embryo dies, it will become addled in a short time. A rotten egg in a nest is very detrimental to the other eggs, and should always be detected and thrown out.

The embryo, which early assumes an appearance reminding one strongly of a red spider, will be found, unless the egg has recently been disturbed, floating at the top of the albumen or "white," close under the shell. The bottom side of the egg will be found not quite as warm as the top, and the eggs in the center of the nest a little warmer than those at the outer edges. The reasons for these discrepancies follow: The hen applies heat by the contact of her body mostly, and this heat is not forced through and to the bottom of the eggs with perfect uniformity all the way through, while the material of which the nest may be constructed cannot be heated to the same temperature as the egg, consequently at the place of contact the egg itself is kept somewhat cooler. The hen cannot throw off and diffuse heat sufficiently to warm those eggs she does not touch with her body, but covers with her feathers, as much as those in the center. So, if we observe her closely without her suspecting our presence, we shall discover that at intervals she rises, and, with her beak principally, proceeds to change the position of the eggs, the inside ones being carried toward the outside, and the outside ones toward the center. Unless we further investigate the purposes of nature in this action, we may be satisfied with the discrepancy in uniformity of heat as an explanation; but other important ends are subserved. The eggs in their comparatively slow transit from center to

* I use a "German study lamp" for the purpose, with a tube of tin, open at both ends, about four inches in diameter, extending from a point just below the burner to a point somewhat above the chimney, completely surrounding the burner, blaze and chimney, vertically, except at a point exactly opposite the blaze, where a short, horizontal tube, large at the inner end, connects with a corresponding opening in the upright. On the edge of the outer end of this short tube (formed like the oval outline and of the size of a small egg) I have fastened a soft black binding of cloth, by sewing it on through perforations in the tin. The device is held in its place, with the burner and chimney in the center of the upright tube, by projections from the lamp just underneath the burner, with clips which receive the bottom of the tube. By placing an egg to the oval opening, in a room otherwise dark, its interior can be examined closely enough for practical purposes. The "study lamp" is preferable for the purpose to anything else I have seen, by reason of its very superior and brilliant white light; also on account of its being so readily adjustable to any required height.

circumference and the reverse are never left the same side up more than a few hours at a time; consequently, a positive requirement that the embryo should frequently have a fresh place in which to feed, so to speak, is met. Should an egg be so secured that the hen could not move it, we would shortly find the embryo dead, dark, and generally fast to the shell. Further, the hen in rising gives her eggs an opportunity to receive fresh air—as essential as any other requirement—and she also probably provides in this way, in part, at least, for the disposal of certain harmful gases generated from the eggs during incubation, especially toward the latter part of the time.

It is natural for a hen to leave her nest for food and drink at least once a day, and on occasion she may leave it for hours without harm; but too frequent repetition of this would result disastrously to the eggs. In my own yards I accidentally shut a hen out from her nest, and she was off six hours; a friend informs me that he had a case where a hen was off a whole day, and in neither of these instances were the eggs injured. I have heard of far more remarkable cases of the kind than either of these, however.

The heat of hens' bodies varies but little in the same bird at different times, and between different birds in a small degree only. This has been one of the most fruitful branches of the whole subject for sticklers, some claiming that a hen's body is more vigorous and therefore warmer when commencing to sit; others as stoutly maintaining that the reverse is true; still others claiming that the eggs receive more heat toward the close, by reason of having lost some of her breast feathers in her monotonous duties. Neither hypothesis is correct—variation in heat in the hen is very little at most, and that in the eggs is due to more potent causes.

When eggs have been under a hen a few hours, their heat approximates that of the hen's body; when they have been sat upon twelve days or so, it is easily discernible that they are somewhat warmer; from the eighteenth day to the time of hatching they are not less than five to ten degrees warmer. One may easily convince himself of this, if he can obtain the opportunity of making the test by comparing eggs which have been under incubation the respective times indicated, in a very simple manner. Shut your eye and place the small end of an egg to it quickly, and you can determine the heat far more accurately than by feeling of them with your fingers. The chick as it develops, and particularly from about the eighteenth or nineteenth day, when it begins to breathe inside its shell (which has then become more porous) generates great heat for itself, and, being confined in narrow limits, with the mother-bird's heat and feather covering to keep away cooler air, it is certainly not wonderful that it should be warmer than its mother, and it is equally clear that it is a strict requirement of nature that it should be warmer to hatch perfectly. I repeat that I have been unable to detect any marked difference in the heat of a hen's body between the time she first covers her eggs and the time of hatching her brood, if in good condition; but that her eggs are very much warmer is so easily determined that I presume every experienced and observant poultry-raiser knows it to be the fact. Yet I have met those who were totally ignorant of this simple thing—they were "incubator" men—and these are the parties who, in lieu of teaching their novitiates something pertinent, tangible and useful, which I claim to be only their bounden duty, enlarge erroneously on matters they know nothing about, but which should be comprehended by a child, if it had the opportunity of informing itself.

When death takes place in an egg, it follows that it will turn colder than the living ones, and it may be easily detected by handling.

It may be surprising to some to discover on examining opposite ends of eggs some time under incubation, that the larger end will generally be found somewhat cooler than the smaller. This is due in most part to the "air-cell," a space between the inner membrane or lining, and the shell, leaving what is familiarly known to mechanics as a "dead air-space," through which the heat from the interior of the egg cannot pass so readily. Before incubation the air-cell in an egg will be found to be about the size of a dime or a little larger. If the hen's nest has been made in a place not too dry, and she has been perfectly healthy, this cell will be found, at the time for hatching, to have increased a trifle in size only; if the nest has been made in a high, dry place, or if the hen has, as sometimes happens, become debilitated, the air-cell at hatching will have largely increased, sometimes extending over fully one-third of the egg. The explanation is, if the egg is exposed to heat without sufficient humidity, the albumen is evaporated through the pores of the shell, greatly impoverishing the chick, and resulting in its death in the shell or soon after leaving it.

I well remember how, when I was a boy, in the State of New York, a hen would "steal her nest" early in the spring in the corner of a rail fence or by and partly under a log, under bushes or weeds, in a damp and seemingly unsuitable place, and the first we knew of her enterprise was when she brought forth a great brood of hungry and vigorous chicks, which throve amain on the sloppy cold-water cornmeal dough thrown them by my thrifty grandmother.

I think it is safe to assume that a hen will seldom choose her nest in the wrong place if she has access to the right one, and that will always be where there is plenty of humidity, near or upon the ground. But nature does not rely exclusively upon surroundings for moisture, for the hen's body exudes it continually when in a state of health.

If eggs receive sufficient moisture during incubation, they have, if in good condition otherwise, a peculiarly fresh and glossy appearance up to the time of hatching; if they have had too little humidity, they will look dull and lifeless. When you pick one up and its shell gives out a sound in handling such as you might expect it to if made of thin, unglazed chinaware, finger it gingerly—

Take it up tenderly,
Lift it with care,—

For it has pent up possibilities of a most disheartening character, which are liable at any moment to assert themselves! The same precaution can be observed with advantage should an egg be discovered exuding a yellow fluid in spots.

The last process before hatching is the drawing or absorbing of the yolk-sack into the body of the chick. Sometimes this is delayed till after the bird has left the shell, in which case death ensues. This is the usual result of lack of heat and tardy incubation. Twenty-one days is the proper time for incubation, and if delayed beyond that time, or if hatching occurs before that time, it is generally at the expense of the chick's constitution; I say generally, for I have sometimes seen a chick hatch much in advance of all others in a nest by sheer superior vigor.

The chick first breaks through the shell usually about twelve hours before hatching. Commencing about five-eighths of an inch from the center of the large end of the egg, it breaks the shell much as though it had been sawed with a coarse saw, entirely around the egg, at the same distance from the center spoken of, in which operation it turns completely around in the shell, finally throwing off the cap thus cut out, and working its way forth. This operation is more or less easy, according to the strength of the chick and the toughness of the shell and lining. Lack of moisture in hatching renders the inner membrane tough and difficult for the young bird to break. So it is not uncommon to see a chick "pip" the shell and die before it is able to emerge.

Three or four hours after hatching, if the bird is strong, it is dry, fluffy and able to walk. G. E. D.

East Oakland, Feb., 1883.

Black Breasted Red Games.

This breed, in my humble opinion, is the one which combines in almost superlatives degree all the good qualities that are desirable in poultry.

Whether we look for hardiness, beauty or utility, the game fowl stands unrivaled. They are hardy and vigorous, easy to raise. The chicks being very beautiful, all of one color, bright lively little things, and growing and feathering rapidly, when a few weeks old resemble a flock of quails in color and activity. They breed very true to feather, in fact, more bred as true as quails. They are singularly free from disease to which many other breeds are subject. The cock is very courageous, and will not hesitate to attack a hawk and defeat him in every attempt to ravage the poultry yard. Intruders of all kinds are summarily dealt with by both cock and hen with young.

They are of graceful form and dignified carriage. Their brilliantly colored plumage is unequaled by any other breed of poultry. Their bright and varied colors are so beautifully blended that they are at once admired by all beholders. While their style, general appearance and noble bearing give them the title of "King of Poultry!"

The hens are good layers of eggs of unrivaled flavor, and exceedingly rich in nutriment. For hatchers and mothers they certainly have no equal, always bringing out a good proportion of chicks, and caring for her young as only a game hen can. While caring for her brood she is as courageous as the cock, defending them to the last gasp. She is an excellent forager, feeding her young if allowed to roam. Games eat a small quantity in proportion to their size—eating much less than any other variety of poultry, and producing as large a quantity of eggs and meat of a much superior quality, the flesh being very delicate and finely flavored. They are such good foragers that on a farm they require but little feeding in summer time. A few handsful of grain will keep them in good laying and growing condition, and their courage and activity prevents their enemies from taking them as a prey. Many a hawk could attest to the courage and prowess of the game cock.

No country gentleman's residence is complete without a flock of these noble birds, and many fanciers in towns and cities cannot be induced to keep any other than games. For the farmer the game fowl is pre-eminently the breed both for eggs and table use.—*Bee and Poultry Magazine.*

A Suggestion to Oregon Breeders.

William Bigham, of Wasco, did more towards building up thoroughbred stock in Oregon than any other three men in the State. He imported six stallions from the East, four of which were sons of Lexington—Dr. Lindsay, Norwich, Luther and Foster, the latter of which was taken back East. Had Bigham brought one stallion and two thoroughbred mares, it would have cost him no more money and it would have been a good deal better for the country. As it is, the supply of thoroughbred mares in Oregon does not exceed twenty, of which Thomas H. Tongue and Jerome Porter control six. Theodore Winters, of California, owns alone more thoroughbred mares than all in this State. Hence, it is useless to build fine race tracks until we get some homebred horses to run on them. Our solution of the existing difficulty would be to get more thoroughbred mares into this State by the formation of an association to be called the "Oregon Oaks Company," having for its object the importation of thoroughbred fillies from the Eastern States or California, and the foundation of an annual fixed event to be called "The Oregon Oaks," to be run under the auspices of the association by three-year-old fillies. If one by a filly owned by the association, the winner to be sold at auction within an hour after the race. This would enable the society to make further importations. We believe that there are forty men in this State who would put in $100 apiece towards founding such an event and building up racing upon a permanent basis of operations. Suppose that the sum of $4,000 will land eight good fillies here. Surely eight men could be found to nominate one each in a stake of one and a quarter miles, at a subscription of $50 each, with $20 as a forfeit. Continue this race for five years, and Oregon would soon be exporting thoroughbred horses to California—not only for sale, but to compete for the rich prizes hung up there under the auspices of the Pacific Blood Horse Association, which numbers among its officers some of the wealthiest and most responsible citizens of that State. Last year there was $700 carried out of this State by a two-year-old filly owned in California which was sent up here for sale at $500. Had she been purchased here on her arrival, that money would have been kept in the country and we should have had one more valuable brood mare in Oregon. Trade Dollar was a fortunate investment for Mr. Isaacs, who gave $400 for her at two years old. She won $450 in purses that year, $820 next year, and $1,000 in her four-year-old form. At five years old she won five races out of seven, making $1,200 more, or a total of $3,475, after which Mr. Isaacs sold her for $1,200 to Mr. Porter. She should be bred to old Lodi once before that aged campaigner dies, and then to Glen Dudley or Chesapeake. Georgia A should be bred to Chesapeake, and her produce will be very nearly related to Thora, the grandest mare that has yet been stripped on the classic ground of Saratoga. Breeding for the turf is a source of vast revenue at the East, where there are several farms with over half a million dollars invested in this business, the most famous being that of Gen. W. G. Harding at Nashville. The average price for his last lot of Bonnie Scotland yearlings, in 1880, was $740 per head. This is getting money out of horseflesh very fast. The auction sales of Mr. Grinstead's yearlings have never been less than $500 per head, and those of Mr. Sanford about $475; while those of the Alexander estate, during Lexington's lifetime, exceeded an average of $800 per head. Of course no such prices can be expected on this coast, as the amount of prizes offered does not justify them. But allow prices to advance as much in the next four years as they have done in the last four, in Kentucky and Tennessee, and racing men of moderate means will be obliged to look to the breeding farms of the Pacific coast for stock to fill their entries. Gano and Duchess of Norfolk have already paved the way for the sale of Pacific bred horses to Eastern purchasers.—*Oregonian.*

THE GUN.

Rights of Sportsmen and Landowners.

At a recent meeting of the Michigan Sportsmen's Association R. P. Toms, Esq., a well-known attorney of Detroit, submitted the following opinion regarding the "Mutual Rights of Sportsmen and Landowners," which is of considerable interest as between sportsmen and non-hunting landowners:

Trespass in the limited and confined sense in which we consider its relation to sportsmen and inclosed premises is well defined. The mere entry by a sportsman upon such land, without permission of the owner (except in pursuit of noxious animals) is a technical trespass no matter how inconsiderable the damage may be. The owner of land has the right to retain for himself the sole use and occupation of his property, and any entry thereon, contrary to that right, and especially if it be against express prohibition, is a trespass for which the trespasser is liable to respond in damages. The common law recognizes two kinds of damages, actual and exemplary. The trespassing sportsman is always liable for the actual damages resulting from his unlawful entry upon inclosed and uninclosed land, and if the trespass is accompanied by circumstances of aggravation (as for instance with the use of insulting language toward the owner, or if it be in disregard to a plain warning) then the law steps in and compels the wrongdoer, in addition to the actual damages, to pay for the same, which is imposed as a punishment for the willfulness of the act. The amount imposed as a penalty is left to the common sense of a jury (if they have any) who are to take into consideration all the surrounding circumstances, and to give their verdict in reference thereto.

But while the law considers that a willful act of trespass should be especially punished, on the other hand it does not absolve the sportsman who inadvertently, in the zeal of pursuit, enters upon another's land. The fact of the trespass remains the same, and the landowner, therefore, is entitled to recover his damages, but is confined to the actual loss he has suffered.

At the common law it was not a misdemeanor to hunt upon the lands of another. Our statute, however, has changed the common law rules, and makes it unlawful to hunt upon the inclosed lands of another without the permission of the owner, and any breach of this law is punishable by a fine, and unless the fine be paid the offender is liable to imprisonment. Therefore the sportsman who trespasses upon inclosed lands is not only civilly responsible to the owner for damages done, but is criminally liable to fine and imprisonment.

The landowner has not an absolute property in the "game" which is upon his land, and therefore if a sportsman, even while trespassing, succeeds in killing a wild animal he becomes its absolute owner, as being the first to reduce it to possession, and the landowner cannot recover, as part of his damages, the value of the game. The only property the latter has in the game to be found on his land is the exclusive right of hunting it, and this right, of course, ceases the moment the game passes beyond the limits of his land.

If a hunter starts and wounds game upon his own land, and it passes mortally wounded to his neighbor's territory, the former has no property in it, nor does he acquire any until he has reduced it to possession. And if, before he succeeds in doing so, a pot-hunter captures the game the latter has an absolute right to it. I hope, however, that no sportsman will ever be guilty of insisting upon this rule of law, although it is in strict accordance with the well-settled American rule that whoever first reduces wild animals to possession and subjection becomes the absolute owner, no matter on whose land they are captured or killed.

It is the rule of nature that everyone has an equal right to pursue and kill wild animals, and that law still holds good in our country, subject only to the restrictions that may be imposed by statute law for the due preservation of game. The statute laws enacted for this purpose respect the rights of the owners of the soil, and give no authority to enter upon land without the owner's permission. They have been adopted, not to please any one class of persons, but simply to prevent the extirpation of game. And the severer the restrictions imposed by them, and the more strictly they are enforced, the better it is for the sportsman and the landowner.

It is somewhat interesting to trace the old English law in regard to hunting, and to note the difference between that and the law at present in vogue in this country. In ancient times the king reserved the forests for his own sport, and no one was at liberty to hunt in them without the sovereign's authority on pain of a heavy pecuniary forfeiture, although at the same time freeholders were free to pursue game upon their own lands. No one but landowners could then become sportsmen, and they only upon their own grounds.

A new doctrine, however, arose after the Norman conquest, and the right to hunt such wild animals as were termed "game" was then considered to belong only to the king, or to such as were authorized under him. This was in harmony with the feudal principle that the king was the ultimate proprietor of all the lands in the kingdom, and hence that the exclusive right of pursuit of all game vested in him as such owner. This royal right was exercised with extreme rigor, and effectually took away from landowners their ancient right of pursuing game on their own lands. The most horrid tyrannies and oppressions grew up through the so-called forest laws, under which the killing of game within the king's forests became a capital offense. In this respect the English laws did not differ much from the laws of France and Germany, which at one time were quite as severe and brutal.

The very hardship of these laws was the cause of their reformation, for the people became so oppressed by them that they united in forcing from the king partial relaxations of their rigors, so that gradually their objectionable features disappeared. Yet even as late as the present century no person in England had the right to kill game except he who had a derivative right from the king. Finally, however, a law was passed by which any person was allowed to purchase a license to kill game upon his own lands, or upon another's, with the owner's permission; and thereafter no sportsman needed qualifications of birth or estate, which had previously been essential.

In our country we find no trace of the old English doctrine, and there has never been a time here when all persons, pot-hunters included, had not an equal right to pursue game, subject to the restrictions already noticed.

The rights of the sportsman and the landowner to game are equal, as neither is the owner. The landowner, if a gentleman, will allow the sportsman to hunt at his own sweet will, and will not order him off the premises in a rude and vulgar manner. And on the other hand, if the sportsman be a gentleman (as every true sportsman is), he will respect the rights of the landowner while hunting over his property, and if ordered off will enter into no unseemly quarrel, but [illegible] once, swearing, if necessary, with bated breath. I know it is myself.

If the landowner "posts" his land, forbidding sh[illegible]

the same, the order should be respected by sportsmen; and, illiberal and mean as it may be on the part of the former, it is better that no trespass be committed, especially as every trespass is willfnl when the trespasser has heen warned to not go npon the land. The instances are rare, indeed, when a landowner will not permit shooting upon his grounds, bnt if he does refuse permission let the sportsman cheerfully leave, consoling himself with the reflectiou that game is not to be found on so mean a man's land.

There is a growing desire on the part of sportsmen to lease or pnrchase large tracts of land or marsh for the exclusive hunting of themselves and friends. The owners of these tracts, if they wish to prohibit trespassing, ought in justice to others to post notices forbidding hunting thereon. The pnblic, and true sportsmeu in particular, will observe and abide sucb notices. And iu case of marshes, owned or leased for shooting purposes and incapahle of being inclosed, if properly posted, they should he treated by sportsmen as inclosed, and no trespass committed thereon.

Poor Pat.

It is cousidered as a lack of feeliug, and if not a lack of the proper sympathetic feeliugs, as a lack of good manners to laugh at the misfortunes of a fellow heing, but there are times and occnrrences where persons suffer when it is a great tax on one's gravity to preserve a sympathetic look ou the face wheu the inward laughter is overflowing. An accident which occurred on one of the marshes the other day, thougb painful in the extreme, is uot without a ludicrous moral. The story is as follows:

Last Saturday a gentleman, unmistakably from the Green Isle, stepped into the gunstore of Klein & Carr, and asked the price of hire of a shotgun, as he was desirous of having a day's hunt for the toothsome wild fowl on one of the marshes near this city. He found such a gun as he wanted, a fine English breechloader, at a fair price, and purchasing a sufficient number of cartridges for the day's sport, went on his way. Ou last Monday morning the proprietors of the above-named firm were somewhat startled at the appearance of a uondescript piece of humanity coming in with their gun. The hody was certainly that of a man, but the head looked as though it bad been tenderly caressed by a gentle thrashing machine. The cause of the swelled head and liheral bandages was explained by Dr. ——, who accompanied the unfortunate representative of Erin's Isle to the marshes. The Doctor and "Pat" were only a short distance apart when the latter, spying a large gray goose flying toward him, resolved to establish for himself the reputation of being a crack wing shot. When his gooseship was nearly over him tbe hunter raised the gun and fired. Following the report of the gun was a second one in the form of a yell—a genuine Irish yell, a whoop that only an Irishman knows how to give and give expression to—that could be heard all over the marsh. The Doctor hastened to his side to see what the effect of the shot was, for he saw very plainly what was the cause. One might say that the gun had burst, but such was not the case; it was made of too good material for that. The would-be nimrod, in raising the gun, did not place the stock against bis shoulder, but let it hang loosely under his arm and placed his face close to the lock, and fired. The gun hanging loose and there being no resistance against the stock, the natural rehonnd, of any firearm, threw the gun back, the hammer striking poor Pat square in the mouth.

"Och, howly mither of Gasis, I'm kilt ded this time shor," he groaned. "I'm knacked spachless and can't thalk, bad luck to the murthering blackguards that loaded the insthrument of disthruction. May the divil get their sowls!" he continued.

While he was praying for the salvation of his own sweet soul and heaping curses on the innocent heads of the gunsmiths, the doctor, who by good fortune is a doctor of dentistry, was cleaning blood and teeth out of Patrick's mouth. The examination showed this result of the shot on Pat's heauty: The chin was black and blue, both lips and mouth cut and five teeth out, heside some looscned—and no goose. It ie needless to eay that he hunted no more that day, unless it was that he hunted for the shortest way home. The moral of this story is tbat it is not safe for a novice to use even the safest of guns—for there was nothing the matter in the least with either tbis gun or the cartridge—without some instruction from a competent person. If anyone doubts this story they can eee the tooth marks on the hammer of the gun in Klein & Carr's gunstore on Market street.

Deer in Humboldt.—The action of some Enrekans towarde enforcing the game laws has caused much talk among those who are posted in such matters. The slaughter of deer in Humholdt conuty in times past would astonisb a stranger, and test his credulity. But few persons, comparatively, have any idea of the immensity of the number. I have no statistics from which to compile an account, but have an item or two that will serve to give a little light on the subject. Steve Fleming killed 110 deer on Larahee Creek in five days. He was a successful bunter and noted deer-slayer for vears in that vicinity. C. H. Hendee, who used to hunt considerahle, sold one year 500 "huck," or large skins, and kept no account of the small deer he killed. During the same year he killed 83 bears, 9 of them grizzlies, 7 panthers, 23 wild cats, 3 South-Fork (Trinity) wolves, 15 foxes, and numerous coyotes. At this time there were many hunters making a business of and living at it, most of whom employed Indians, and killed more deer than one who hunted alone, as Hendee did. During the last four or six months one small trader at Bridgeville has bought over 1,000 deer skins, and he estimates the number of deer killed in that direction, in the last four months, as 5,000. Is it anything surprising that they are becoming scarce and wild? But even uow—late as it is to begin—if the game lawe were strictly enforced, and the slaughter by thoae hunting for skins and profit stopped, deer would in a few yeara be plentiful again. We ehall watch with interest to see what that Eureka club does.—*Times-Telephone.*

An immense boar with tuska from four to five inches in length and weighing 1,100 was shot by Johu and Tom Murphy, on Mrs. Fagau's land below Salida. It must be fine sport, not unaccompanied with danger, to shoot these wild hogs on the river bottoms. This oue was hunted and killed in the timber on the Stanislaus river and received its quietus from two rifle shots, one breaking the spine betweeu the shoulders, the other lodging in the hip.—*Modesto Journal.*

Most of the care killed on the Alameda marshes and on Bird's bridge are in very good condition; it is supposed that they keep in fair flesh by feeding nights across the bay around Mission creek and around Butchertown.

Twelve members of the Recreation Gun Team of Los Angeles, Capt. H. T. Payne commanding, went to the Ballona two or three days ago and had rare sport, bagging 300 ducks.

How Trapping Quail Should be Lawful.

Editor Breeder and Sportsman: I think the proposed game law should provide for trapping quail for transportation, for propagation, from one part of the State to the other: In some places, such as Los Angeles and San Diego, they are too plentiful; in other parts, such as in Santa Clara county, they are too few. It should be no offense to transport them. The only object of the law, and it can surely be worded to that effect, should he to prevent trapping quail for market. Common Sense.

Gilroy, Feb. 14.

The pigeon-shooting match between Dr. W. F. Carver and Captain A. H. Bogardus for the championship of the world will take place at Louisville on February 22. They are to shoot at 100 birds each, 30 yards rise, Hurlingham rules, for a stake of $1,000, the winner to take tbe gate money. To give additional interest to the affair the Louisville Sportsmen's Association have arranged for a three-day shoot, to begin on the 21st and continue on the 22d and 23d. On the 21st there will he two contests, one at $5 each, with $250 added, five birds, twenty-five yards, from plunge traps, and one at $10 each, with $500 added, ten birds, thirty yards rise, from five ground traps. On the 23d the first shoot is at $8 each, $400 added, eight birds, twenty-six yards, and the other at $10 each, with $500 added, ten birds, tbirty yards, both from plunge traps.

The shooting up near Teal Station last week was very lively. There is no hunting done at all over the ponds, but sculling in the sloughs affords excellent sport. It is true that the birds are rather poor in flesh and flavor, but like a thin hog they are quite lively and fly very rapidly. The latter part of last week a party from this city were up shooting in the sloughs, and made some very good bags. Mr. C. W. Kellogg killed 66, Austin C. Tubbs 53, and Messrs. H. Babcock and H. McAllester 59 ducks, making in all 168 birds.

At Biggs, Butte county, on Thursday of last week, twenty-six persons took part in a competitive rabbit hunt. They divided into two parties of thirteen each, one under the captaincy of Lon Rose and the other marshaled by C. S. Quinby. After being out for three hours the hunters compared notes and found the Rose party to be the winner, having bagged 263 hare. The Quinby team killed 252, making a total of 515 jack rabbits. Cold day for Jack.

Geo. Bird is making arrangements for the accommodation of clay-pigeon as well as live-pigeon shooters ou his premises at Alameda. The sporting season promises to open up early this year and be a very lively one, and Mr. Bird is going to be ready to catch the first worm when it comes to trap shooting.

Last week Messrs. J. Stack, H. Spencer, Wm. Golcher and Aaron Walker were at Jersey Landing for a day or two and had considerahle sport with their guns. They found shooting to he excellent, in fact far better than the game, and made a bag of 240 birds during their stay.

At the Cordelia Clnb's preserves the last shot has been fired and the last dnck killed for this year. Though the hunting season will not be over for several weeks, March 15tb, this club has brought home their hunting yacht, the Lolita, and closed the season as far as their club is concerned.

AMONG THE "CANS."

A Morning at the Cordelia Club's Grounds on Suisun Marsh.

Editor Breeder and Sportsman: Although the season has beeu far from satisactory, we have had some good shoots up at our preserves at Cordelia, in Suisun marsh. Most of your readers know, of course, how we get there and how we live when there. That we go by boat and rail to Teal Station and are there met by Capt. Chittenden who has charge of the Cordelia Club's preserves and headquarters. We have the comfortahle and roomy yacht Lolita to live aboard, and all the pleasant surroundings which a hunter loves. Our yacht is close beside the railroad track, near tbe station, and we have only a short pull on the boats to the ponds where our blinds are.

I want to tell you of the day's sport which will be a sample of many. We rouse ont very early, find a good hot breakfast ready, take our guns and traps and start off in the dark for the ponds some little distance up the slough.

I reached the landing before daybreak and after the usual transfer of guns, decoys, etc., to the pond boats I started through the ditch leading to our ponds. On entering the first one I was disappointed in not putting out any birds; however, I pusbed on through ditches aud small puddles until I approached the pond in wbich I intended shooting; suddenly I heard the birds as they rose from tbe water and recognized the unmistakable whirr of the canvasbacks. In a moment they were flitting past me by dozens, and as I reached my destination I could hear the cans getting up on all sides of me.

It was now getting quite light in the East and hurriedly putting out my decoys I got on shore, and as I shoved the boat in the blind, two birds alighted among the stool, which I knew by the splash to be cans. Cautionsly taking an observation aud with gun in position I wait for them to lap; presently they swim together and the first shot of the morning sounds their death knell.

Without picking them up at once as I should have done, I got into the blind and watched for my next victim, which was not long in making its appearance. An old drake can passed across the pond and my second shot laid him out alongside of the other two. In the next ten minntes I got a number of shots at sprig, which are easily whistled in over the decoys. Of these I killed a fair average. After this there was a lull for a short time.

As I was sitting down in the boat to rest for a moment, I suddenly heard tbe whiz of wings and knew at once that there was a large bunch of cans near. The sound came louder and louder and in another moment the birds passed directly over my head not 20 feet in the air. I sounded the call aud hy peering through the blind I could see about 30 of them swim back over the fartbest side of the pond; as they came head on I hesitated whether to try a shot or take the chances on their alighting. I decided on the latter course. Three times they made the circuit of the pond and on the fourth time I felt sure that they would alight, but they only sounded their alarm note and struck out for the bay. The cause of their action was the dead birds that lay in the water, the canvasbacks never alighting when there is a bird belly up. So much for being greedy. I could eurely have bagged two or three at any time they passed me. My disappointment is soon forgotten as I watcb two specks about a mile off evidently heading for me; as they get near they prove to he cans. Passing about 100 yards from me, I call them and turniug at the sound they come quartering to the right across the decoys. I know by the speed with which they are going that I mnst he qnick with my first barrel or I will never get in my secoud one. As they just enter the pond I stand up and center one with the first barrel and make a quick shot with the second, and as the smoke clears I can see two fine drakes down, giving their last kick, belly up. This was quite gratifying and pushing the boat ont I commenced to pick up the dead birds. After gathering abont a dozen I lauded on a small bog to get two others that I had dropped there. After a few minutes I found tbem and on returning to the boat just got a glimpse of three dncks as they alighted among the decoys. Creeping to the edge of the tule I saw three of my red-headed friends in with the dummy ducks, clucking and looking for recognition from them, I cut short their actions by tumbling over two and allowing the tbird to skip ont untouched.

I started to get into my boat again and just as I turned I had barely time to throw my gun up and take a snap shot at another pair that were passing. I was fortunate in stopping both, they falling into the water and as the hen was only winged she started to swim off, hut my choke-hore detained her before she had gone far.

Before I could reach the blind I had several shots with the usnal uumber of misses, and on getting in and counting up I had some twenty birds. From this time on the shots were not quite so frequent; however, the birds kept coming in so that I had comfortable shooting, and as a consequence of pond shooting in this locality one will necessarily lose a large number of birds in the tule grass, where it is almost impossible to find them, a good retriever being of little use. After the final "pick up" there were in the boat twenty-three cans and twelve sprig, which hanging from my duck strap made about as handsome a bag as any sportsman could wish for.

F. S. B.

FISH.

Salmon Trout.—The late rain has proved a godsend to the thonsands of salmon tront that have heen for weeks trying to get into fresh water streams hut have been prevented by the sand-bars washed up by the waves of the ocean and bay. The rains have raised the waters of the creeks till they have burst through these obstructions, and now the roadway is clear to the spawning grounds at the headquarters. The fishermen say that the fish are almost hursting with spawn and it will not he long ere the freshwater streams, like a grain field in the spring, will be sown with embryo trout. There is one stream, however, whose tributaries drain an area of over fifty miles in circumference where fish are still barred out; that is the stream where Sam Taylor has made a dam at his paper mills. Anglers are very indignant that hs has not put in a fish ladder over the obstruction as he hae been ordered to do hy our courts.

Ahout the early part of last week a number of beantiful large salmon trout made their appearance around the old Alameda wharf. They are evidently hunting for a freshwater creek, up which they can proceed and deposit their spawn. Several have been taken that measure from two to three feet in length. They will not take the hook, never mind how tempting the bait, hut at tbe half tide they can be seen, and by a ekillful hand can be easily taken with a fish spear. At the half tide their dark bodies over the light mud bottom afford an excellent target for the spear sharpshooter.

Thirteen cans of whitefish fry from the State hatchery were deposited in Lake Tahoe one day last week.

Oxford and Cambridge.

At last advices both the Oxford and Cambridge University Boat Clubs were at work getting their crews in shape for the annnal contest on the Thames on St. Patrick'e Day. Both the Isis and the Cam are very much swollen by reason of the floods, and from all accounts it would seem that owing to the early date for the race considerable difficulty will be experienced in getting the crews into first-rate condition. The crews and weights on the 17th were as follows:

OXFORD.	lb.

* Rowed in the race last year.

Ice-Yachts.—A note in the *Spirit* from Poughkeepsie says: "At no time in the history of the evolution of the ice-yacbt, has so mnch interest heen taken in this most exhilarating of all sports. New yachts, of new and approved models, of the costliest materials and best workmanship, are building, and many gentlemen who never before took auy interest in ice-yachtiug are now joining the Poughkeepsie Club and making preparations for entering the regattas, matches and scrub races where pennants, cups, tankards, dollars aud glory may be won. Every day parties of ladies and gentlemen, guests of the members of the club, come from New York to sail on the yachts, while hundreds of the citizens line the banks of the river and gather round the regatta flag to see the flyers start on their course. The river, from Newhurg to Albany, is as smooth as a plate glass mirror, broken only on the edges by a silver frame of snow-covered ice thrown up hy the rising tide. The finest sight is in Roosevelt's hay, where the yachts of the Poughkeepsie Club rendezvous, the building in which they are housed in the summer standing on the grounds of Commodore Roosevelt, which extend from the Albany post road, on the east, to the river on the west. Here may be seen, flying about at a high rate of speed, forty, fifty, sixty, and even seventy miles an hour, the most perfect ice-yachts in the world, on which the iugennity of the huilder has been exhausted to secure the greatest speed and beauty. Snowy sails, poliehed wood, plated metal aud upholstered box, make them things of beauty; and their stability, joys forever.

Dr. W. B. Sawyer of Los Angeles has a Richmond colt two years old in training that turns his mile in 2:44.

New Improvements.

The "El Monte" Saloon, corner Kearny and Pine streets, has been thoronghly refitted and refurnished, and is now under the management of the veteran, Sam Tetlow, and under the proprietorship of J. E. Slinkey of the El Monte Hotel, Sancelito.

A Useful Article.—Rawson's U. S. Army Suspensory Bandage is, as the cut connected with the advertisement elsewhere clearly shows, a complete relief and support, and shonld be in general nse. It is self-adjnsting, and displacement is impossible. It counteracts nervons tension and other ills that mankind is heir to. Sold by all druggists. Can be sent by mail safetly. Address S. E. G. Rawson, Patentee, Saratoga Springs, N. Y.

A Slight Cold, if neglected often attacks the lungs. Brown's Bronchial Troches give sure and almost immediate relief. *Sold only in boxes.* Price 25 cents.

The Laws of Heredity.

Although the laws of heredity are becoming better understood and more intelligently followed by breeders of trotting horses every year, there are puzzling factors in the problem, to eolve which eo much time and money has been expended, that have so far baffled the most intelligent stndents. It long ego became apparent to breeders of the thoroughbred racehorse that the old adage: "Like produces like," was true only in a modified senee. A great performer on the turf would make his a ppearance, sweeping down opposing fields of horses as the sickle lays low the ripened grain, and straightway the mare that bore him would be bred again to the horse whose son he was, in the hope of producing another wonder. The cold facts and figures of history ehow that in a vast majority of instances the result has in no measure equaled the anticipations of those who brought it about. Harry Bassett was certainly a great racehorse—one of the best, perheps, that this country ever saw—bnt his brother, Franklin, never rose above the level of a plater. Parole was a winner in this country at all distances up to two milee, and in Englsnd could run a distance and carry weight in a style that stamped him as first-class in every respect; but of all hie brothers and eisters James A was the only one that showed good enough public form to rank in the category of racehorses, and even his performances were not of a character that made him sought after as a stallion when his racing days were over. Iroquois, whose winning of the Epsom Derby in 1881 is still fresh in the public mind, capped that performance by others of euch undeniably high character that even the English public—critical judges enough in such a matter—were forced to admit that "the Yankee" was as good as the best. His sister Francesca, purchased by the Dwyers at a long price when a yearling, was a weed of the rankeet description. Instances of this kind might be multiplied almost indefinitely; hnt enough has been given to eerve the purpose.

In the case of trotters the data at hand bearing on this qnestion are rather meager, owing to the fact that the breeding of these horses has been done in a systematic manner for only a few years, but eo far as these data go they tell the same etory. Rarue trotted a pnblic mile in 2:13½, and was the fastest, gamest and best horse on the turf in his day. His full brother, Rectus, was never a speedy horse, although accident prevented hie eyetematic preparation for the track. St. Julien, whose record of 2:11¼ is the best ever made by a gelding, has a full brother and sister, St. Remo and Unolata. The mare is a good one, capable of a mile in 2:20 when at her best, bnt even that leaves her nearly ten eeconds behind her brother in point of speed, which means a long dietance when two horsee are trotting against each other. St. Remo has never shown himself to be nearly as good as Unolala. Piedmont is one of the fastest etallions this country has ever produced. He made a record of 2:17¼ in the fourth beat of a hotly contested race against the best field of etallious that ever faced a starter, and since going to California has improved so much that Chas. Marvin, who drove Smuggler in 2:15¼, and who had charge of Piedmont last season, believes him capable of heating the hest etallion record ever made. Piedmont's brother, Mammont, ie owned in Illinoie, but he has never yet ehown the ability to beat 2:30. Dexter was incomparahly the best horee of his day at all ways of going; eo good, indeed, that when Hiram Woodruff transferred the little brown gelding to Budd Doble, then hardly past boyhood, the honest old man, who never pnlled a race or beat in hie life, said to Doble: "There ie a horse thet cen win every heat you etart for with him." And Doble found that his instructor in the art of riding and driving had judged the animal aright. Dexter'e brother, Dictator, never had anything like the speed of his relative, but Dictator'e eon, Jay-Eye-See, was in form and temperament eo like hie uncle that after Doble, who was put up unexpectedly behind the great four-year-old in his race at Chicago last summer, had driven him a heat, he eaid to a friend: "There ie another Dexter." In thie case the form and speed were reproduced in the second generation. Astoria, the sister to Dexter and Dictator, has had all the benefits which cereful training and driving can give, but her pnblic mile ie only a trifle under 2:30. Mr. Allie Bonner, who is probably the best amateur reinsman in the country, believes that ehe will go mnch faster than this, and his jndgment is worth something. Astoria is now the property of Commodore Kittson, and Splan will train her in the epring for the grand campaign. The result of his labors will he watched with interest by all for whom the breeding problem has attractions.

But while the lack of nniformity of results in breeding from winners end the dams and siree of winners is eometimes very noticeable; yet none will be so foolieh as to ergue that the syetem is not the only one that can lead to permanent anccees. The failures are, of course, conspicuous; but the successes are likewiee many and notable.

Market Report.

FLOUR—We quote: Best City Extra, $5 80@$6; Superfine, $5@$5 50; Interior Extra, $4 75@$5 50; Interior Superfine, $3 75@$4 50 ₩ bbl.

WHEAT—An improvement in the Liverpool market has, no doubt, etrengthened our local market and has given it an upward tendency. No. 1 grades find ready purchasers at $1 90, and the choicest at $1 91. Sellers, however, are holding off to get $1 92½ and do not care to take less. Recent sales are, No. 1 February, $1 02¼@$1 93; do. March, $1 92¼.

BARLEY—The market in thie grain though firm has neither an upward tendency nor are the prices inclined to fall immediately. Recent aales are, No. 1 Feed February, $1 10½@$1 20½; March, $1 18¼@$1 19; April, $1 18¾; these are top ruling figures.

OATS—Fair Feed, $1 70@$1 75; Good, $1 75@$1 82½; Choice, $1 85@$1 95 ₩ ctl.

RYE—Firm. Quotable at $1 76@$2 for fair to good.

FEED—Ground Barley, $28@$30 ₩ ton; Cracked Corn, $36 ₩ ton; Shorta, $17@$19 ₩ ton; Oilcake meal the oilworks eell to the trade at $35 ₩ ton, lesa the nsual discount; Middlinge, $24@$25 ₩ ton for lots at the mill.

HAY—Alfalfa, $13 60@$15; Wheet, $15 50@$17 Wild Oat, $15@$17; Mixed, $11@$15 ₩ ton.

STRAW—80c per hale.

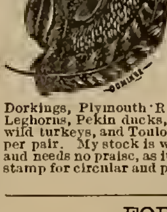
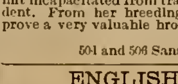
Thoroughbred Poultry.



2,000 to Select from

HAVING DISPOSED OF my dairy, I devote my whole time to poultry, and think I can please all who desire to purchase first-class hreeding or exhibition stock, or eggs for hatching. I keep all the leading varieties of both land and water fowls, i. e., Light Brahmas, Langshans, Dorkings, Plymouth Rocks, White, Brown or Black Leghorns, Pekin ducks, Rouen ducks, Bronze turkeys, wild turkeys, and Toulouse geese that weigh over 50 lbs per pair. My stock is well known all over the Coast, and needs no praise, as it speaks for itself. Send 3-cent stamp for circular and price-list.
R. G. HEAD. Napa, Cal.

FOR SALE.



THE WELL-KNOWN TROTting mare Nellie Grant, by Fred Low, from old Lady Grant, of Whip, Morgan and Copperbottom stock. Nellie Grant is black without white, eixteen hands one inch high, of fine form, and free from hereditary defects. She was a very fast trotter hut incapacitated from track work owing to an accident. From her breeding, form and speed she should prove a very valuable hroodmare. Apply to
JOHN HOWES,
501 and 506 Sansome street, San Francisco.

ENGLISH SETTERS.

FOR SALE.

For Sale—Young Copperhead.

A BEAUTIFUL DARK BROWN stallion, seven years old, sixteen hande high, weighing 1,200 lbs; can trot in three minutes; kind and gentle in every particular. May he seen at Oakland trotting park until sold. Pedigree—Sired by Copperhead (2:34), by Owen Dale; dam Nellie Eastman by the Watkins horse (Black Hawk) from Missouri. His dam was a Printer mare; Nellie Eastman's dam, Nancy Ringo, was by Tinker, a thoroughbred horse, ont of a Selam mare, grandam by Old Paul, by Ned Burns, he by John Richard by Sir Archie. This is an excellent large stock horse, well adapted to all purposes, especially as the sire of roadsters and carriage horses, Price $1,200, less than half his value. Address
G. S. BANKS.
Oakland racetrack or 1305 Pine street, San Francisco. 7t2

Thoroughbred Colt for Sale.

CITO. CHESTNUT COLT, FOALED APRIL 5, 1882. By Joe Hooker, his dam Too Soon by Norfolk, grandam Lady Davis (dam of Dashaway) by Red Bill, son of Medoc, etc. This is a highly-formed colt, of good size and a hearty feeder. Being nearly a brother in blood to Fred Collier (Lady Davis being the great Grandam of Fred, and his dam also being by Norfolk) and the Joe Hookers so far as tried all racehorses, this is a good chance to get a colt of great promise for a moderate sum. He has four white legs above knees and hocks, a white face and other white markings. Price $300 if applied for before the 1st of March. For further particulars address this office.

FOR SALE.

A VERY FINE HAMBLETOnian stallion, imported from Syracuse, N. Y.; nine years old; mahogany bay; eixteen hands high; perfectly sound; well broken; very stylish; cost over $1,500; property of a banker; full papers; got by Hambletonian Prince, he by Volunteer. Can be eeen at Club Stablee.

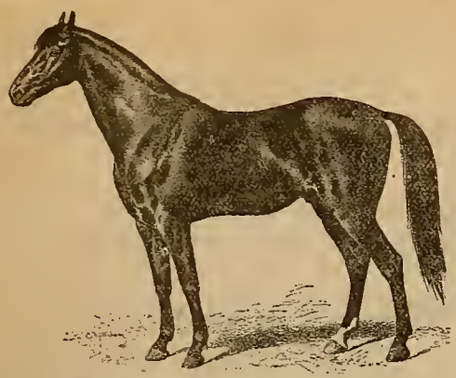
ADVERTISE NOW IN THE BREEDER AND SPORTSMAN

STALLIONS.



MAMBRINO WILKES.

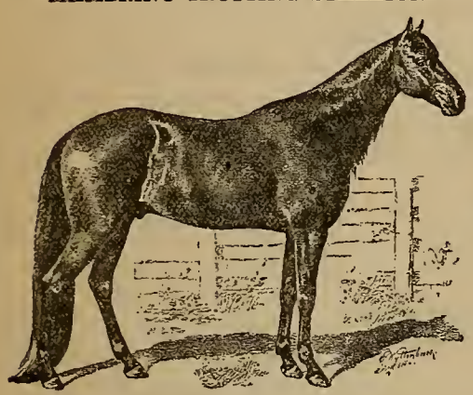
Black Stallion, sixteen hands in height, by George Wilkes, son of Rysdyk's Hambletonian, bred by B. J. Treacy of Fayette County, Kentucky. Dam Lady Christman by Todhunter's Mambrino or Idol, son of Mambrino Chief. Second dam by Pilot Jr. Third dam by Kentucky Whip. Idol's dam was thoroughbred and was by American Eclipse.

THIS IS THE LARGEST AND ONE OF THE BEST COLTS OF George Wilkes (weighing at this date 1,260 pounds) combining the Hambletonian and Mambrino strains and also several thoroughbred crosses. His colts demonstrate that he possesses in an eminent degree the same faculty of transmitting the family qualities to his offspring which put George Wilkes in the front rank as a sire of trotters.

Will make the ensuing season, beginning February 1st, 1883, at STOCKTON.

In putting the price by the season at the low figure of $40 the owner does not acknowledge, thereby, any inferiority on the part of this horse to any other sire of Trotters. **IRVIN AYRES.**

MAMBRINO TROTTING STALLION



ABBOTSFORD.

☞ Record at Six Years old, 2:21½. ☜

PEDIGREE.

BY WOODFORD MAMBRINO, HIS DAM COLUMBIA BY YOUNG Columbus. Woodford Mambrino by Mambrino Chief, his dam Woodbine by Woodford, a thoroughbred son of Kosciusko.

Woodford Mambrino is recognized to be the best son of Mambrino Chief. His own record is 2:21½, and there are a large number of his get in the 2:30 list. Among them: Abbottsford, 2:21½; Convoy, 2:22½; Mageuta, 2:24½; Lady McFatridge, 2:29; Dacia, 2:29½; George A. Ayer, 2:30.

Besides those having public records, he is the sire of the two celebrated mares owned by Robert Bonner—Manetta and Maltce. Manetta, with a running mate, and harnessed to a road wagon, trotted two miles in 4:27½, and Malice trotted a trial, on the same track, a mile in 2:19¾. Woodford Mambrino is also the sire of Princeps, the sire of Trinket; record, 2:14. Woodbine is also the dam of Wedgewood, record, 2:19. Young Columbus, the sire of the dam of Abbottsford, has nine of his get in the 2:30 list, so that on both sides of the house there are notable performers. Abbotsford is a rich rosewood brown, 15¾ hands, and of very high form. His get are very promising, his daughter Jasmine having won the Embryo Stake for yearlings in 1881, and every one which has been put in training has shown good speed.

TERMS.

Seventy-five dollars the season, to be paid before removing the animal. Mares not proving in foal can be returned the following season free of charge. Good pasturage at reasonable rates, and extra pains taken, but no liability for accidents or escapes.

LOCATION.

Abbotsford will make the ensuing season, 1883, on the ranch of S. B. Whipple, Esq., San Mateo, season commencing February 15th and ending June 1st, 1883. For full history see the issue of BREEDER AND SPORTSMAN of August 5th, 1882.

GEORGE BAYLIS. Agent, San Mateo, Cal.

ANTEEO.

7th dam—By imported Medley.
8th " By imported Centinel.
9th " By Mark Anthony.
10th " By imported Janus.
11th " By imported Monkey.
12th " By imported Silvereye.
13th " By Spanker.

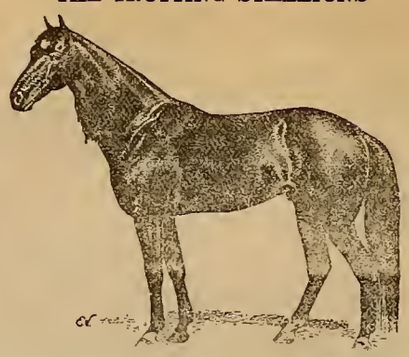
See Bruce's American Stud Book, vol. 1, p. 307, and vol. 3, p. 79.

Will make the ensuing season, 1883, from February 15th to June 15th, at the Oakland Trotting Park. Terms $30 the season.

JOSEPH CAIRN SIMPSON,
Oakland or 508 Montgomery street, San Francisco.

STALLIONS.

THE TROTTING STALLIONS



SINGLETON AND LA HARPE.

SINGLETON WILL MAKE THE COMING SEASON, FROM March 1st to July 15th, 1883, at the farm of the owner, three miles north of Chico, Butte Co., Cal.

PEDIGREE.

Singleton is by Willie Schepper, a son of Rysdyk's Hambletonian, his dam Lightfoot (the dam of Pride) by Flaxtail, a son of Pruden's Blue Bull.

DESCRIPTION.

Singleton is a dark brown horse, tan flanks and muzzle, a little touch of white on hind feet and one fore foot, and star in forehead. He is 15¾ hands high and weighs 1,100 pounds. He was bred by Dr. M. W. Hicks, foaled spring of 1876.

TERMS.

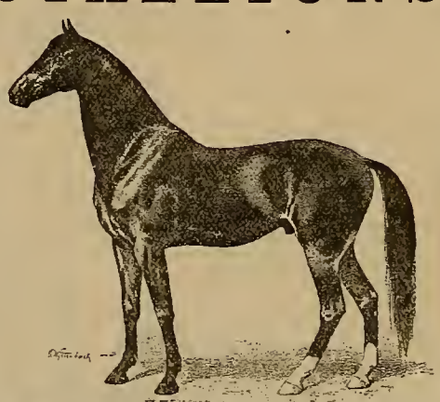
Fifty dollars the season. Mares not proving in foal will be bred the following season free of charge. Mares from a distance will be pastured without charge during the season. Mares shipped to Chico, consigned to me, will be received on arrival of train, and taken to the ranch. Mares kept in any manner their owners desire, at reasonable rates. There is every convenience on the place, boxes, paddocks and plenty of shade and water.

LA HARPE

Will also make a short season at the above place on private terms. La Harpe is by Fame, a son of Alexander's Belmont, his dam Prairie Bird by Flaxtail, the dam of Flight and Prompter. Address

J. T. McINTOSH, Chico, Cal.

STALLIONS.

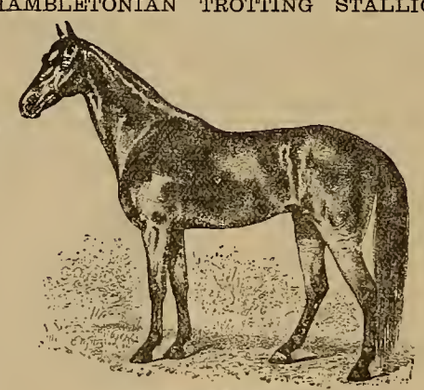


OWNERS OF STALLIONS DESIRING TO PLACE THE MERITS of their stock horses before the breeding public should advertise in the BREEDER AND SPORTSMAN. The fee from one mare will pay the cost of a reasonable advertisement.

Stallion bills printed in first-class style. Call at this office and see samples.

NO. 508 MONTGOMERY ST.

HAMBLETONIAN TROTTING STALLION



BOB MASON

By Echo. His dam Belle Mason by Belmont, Thoroughbred.

Echo by Rysdyk's Hambletonian, his dam Fanny Felter by Magnolia (by American Star). Belle Mason by Belmont (Williamson's); First dam Lucy Johnson by the Pony (son of Imported Leviathan); second dam Catalpa, by Frank; third dam by John Richards.

WILL MAKE THE ENSUING SEASON, LIMITED TO TWENTY mares, commencing February 15, 1883, and ending June 15, 1883, at the stables of his owner, Figueroa street, Los Angeles.

DESCRIPTION.

Bob Mason is a mahogany bay, with inside of off hind ankle white and star in forehead; sixteen hands, and weighs 1,100 pounds. Foaled May 10, 1879. He is of fine, kindly disposition, a natural trotter, and has shown great speed, but as yet has no public record. For full history of his sire, Echo, see BREEDER AND SPORTSMAN July 29, 1882. See also, for his full brother, Exile, BREEDER AND SPORTSMAN, issue of September 16, 1882.

TERMS.

One hundred dollars the season, payable at time of service. All mares at risk of owners. Mares not proving in foal can be returned the following season free of charge. Address

CHARLES J. ELLIS.
Post office box 55, Los Angeles, Cal.

STALLIONS.

THE THOROUGHBRED STALLION

JOE HOOKER,

BY MONDAY.

First Dam Mayflower, by imported Eclipse.
Second dam Heunie Farrow, by imported Shamrock.
Third dam Ida, by imported Belshazzar.
Fourth dam Gamma's dam, by Sir Richard.
Fifth dam by imported Eagle.
Sixth dam Bet Bosley, by Wilkes' Wonder.
Seventh dam by Chanticleer.

ANNOUNCE THE FOLLOWING

Trotting Stakes for 1883 & '84.

Three-Year-Old Stakes.

No. 1—The Ashland Trotting Stake, 1883, for colts and fillies (foals of 1880); to be trotted when three years old, during the summer trotting meeting of the Chicago Driving Park for 1883; $100 entrance, of which $15 is forfeit and must accompany the nomination; $15 payable May 1, 1883; $20 on June 1, 1883, and the remaining $50, from those who start only, at or before 8 o'clock p. m. of the day preceding that named for the race; the Chicago Driving Park to add $1,000.

No. 2—The Ashland Trotting Stake, 1884, for colts and fillies (foals of 1881); to be trotted when three years old, during the summer trotting meeting of the Chicago Driving Park for 1884; $100 entrance, of which $10 is forfeit and must accompany the nomination; $15 on January 1, 1884; $25 on June 1, 1884, and the remaining $50, from those who start only, at or before 8 o'clock p. m. of the day preceding that named for the race. The Chicago Driving Park to add $2,500.

Four-Year-Old Stakes.

No. 3—The Chicago Trotting Stake, 1883, for colts and fillies (foals of 1879); to be trotted for when four years old, during the summer trotting meeting of the Chicago Driving Park for 1883; $100 entrance, of which $15 is forfeit and must accompany the nomination; $15 payable on May 1, 1883; $20 on June 1, 1883, and the remaining $50, from those who start only, at or before 8 o'clock p. m. of the day preceding that named for the race. The Chicago Driving Park to add $1,000.

No. 4—The Chicago Trotting Stake, 1884, for colts and fillies (foals of 1880); to be trotted when four years old, at the summer trotting meeting of the Chicago Driving Park for 1884; $100 entrance, of which $10 is forfeit and must accompany the nomination; $15 on January 1, 1884, $25 on June 1, 1884, and the remaining $50, from those who start only, at or before 8 o'clock p. m. of the day preceding that named for the race. The Chicago Driving Park to add $2,500.

Conditions.

All of the above stakes to be mile heats, best three in five, in harness, and to the rules of the National Trotting Association. Moneys to be divided as follows: Seventy-five per cent. of entrance fees, forfeits and added money to the first horse, 15 per cent. to the second horse and 10 per cent. to the third horse. In all stakes, five entries required to fill. All forfeits and payments must be made in cash on the day specified by the conditions of the stake, and in case of default of any payment the horse is out, and all payments made before such a default are forfeited. Entries for all the above stakes close on Thursday, March 1, 1883, and nominations must be accompanied by the forfeit money and addressed to

TICKET OFFICES.—Passenger Depot, Townsend street, and No. 2 New Montgomery street, Palace Hotel.

A. C. BASSETT, Superintendent. H. R. JUDAH, Asst. Pass. & Tkt. Agt.

☞ S. P. Atlantic Express Train via Los Angeles, Yuma, etc., leaves San Francisco daily via Oakland ferry, foot of Market street, at 9:30 A. M.

TO

Sportsmen & Pleasure-Seekers.

THE

SOUTHERN PACIFIC R. R. CO.

RESPECTFULLY CALLS ATTENTION TO THE

SUPERIOR FACILITIES

AFFORDED BY THEIR LINE FOR REACHING with speed and comfort the best places in the State for

Sea Bathing, Shooting and Fishing.

TRAINS LEAVE SAN FRANCISCO DAILY FOR

MONTEREY,

THE MOST CHARMING

Summer and Winter Resort of the Pacific Coast,

with its beautiful Groves and delightful Drives. Trout in ebundance can be obtained from the several streams in the vicinity of Monterey, and the best shooting may be had in season.

THE BAY OF MONTEREY

Is noted for the extent and variety of fish which abound in its waters, notably Salmon, Rock Cod, Barracuda, Pompano, Spanish Mackerel, and Flounder. The above-mentioned attractions, in counection with the low rates of fare, rapid transit, and the superior accommodations furnished at the "HOTEL DEL MONTE," have made Monterey a paradise for sportsmen.

THE BATHING ESTABLISHMENT

OF THE

"HOTEL DEL MONTE,"

IS UNSURPASSED.

A SPACIOUS SWIMMING TANK

(150 X 50 feet)

FOR WARM SALT WATER, PLUNGE AND SWIMMING BATHS.

ELEGANT ROOMS

For Individual Baths with DOUCHE and SHOWER facilities.

MAGNIFICENT BEACH

Of pure white sand for SURF BATHING, Etc., Etc.

THE FAVORITE ROUTE to those well-known Watering Places,

APTOS, SOQUEL AND SANTA CRUZ,

IS VIA THE

Southern Pacific Railroad,

(Broad Gauge), and the

SANTA CRUZ RAILROAD.

☞ At PAJARO, the SANTA CRUZ R. R. connects daily with Trains of the S. P. R. R.

The S. P. R. R. runs through the counties of San Mateo, Santa Clara, San Benito, Santa Cruz and Monterey, in each of which game ebounds in great variety. Notably

Quail, Pigeon, Snipe, Duck, Geese, Deer and Bear.

Lakes PILARCITOS and SAN ANDREAS are reached by this line. Stages connect with trains daily at San Mateo for those well-known Retreats, PURISSIMA, SAN GREGORIO and PESCADERO. We would particularly call attention to the unlimited extent of range at and about SAN BRUNO and McMAHONS for RIFLE PRACTICE.

These resorts are but a short distance from San Francisco and offer special inducements to the lovers of this manly sport.

SPECIAL NOTICE.

Sportsmen and others presenting Passage Tickets o any description issued by this Company will be entitled to

FREE TRANSPORTATION OF THEIR DOGS

when carried in Baggage Cars and put in charge of Train Baggagemen. Train Baggagemen are instructed to issue CHECKS for all dogs received in Baggage Cars.

☞ In order to guard against accidents to Dogs while in transit, it is necessary that they be provided with COLLAR AND CHAIN. Guns and Fishing Tackle checked and carried free of charge. Guns taken apart and securely packed in wood or leather cases may be taken in Passenger Cars.

TICKET OFFICES.—Passenger Depot, Townsend street, and No. 2 New Montgomery street, Palace Hotel.

A. C. BASSETT, Superintendent H. R. JUDAH, Asst. Pass. and Tkt Agt.

☞ S. P. Atlantic Express Train via Los Yuma, etc., leaves San Francisco daily v Ferry, foot of Market Street at 9:30 A. M.

I CURE FITS!

When I say cure I do not mean merely to stop them for a time and then have them return again. I mean a radical cure. I have made the disease of FITS, EPILEPSY or FALLING SICKNESS a life-long study. I warrant my remedy to cure the worst cases. Because others have failed is no reason for not now receiving a cure. Send at once for a treatise and a Free Bottle of my infallible remedy. Give Express and Post Office. It costs you nothing for a trial, and I will cure you. Address Dr. H. G. ROOT, 183 Pearl St., New York.

CONSUMPTION.

I have a positive remedy for the above disease; by its use thousands of cases of the worst kind and of long standing have been cured. Indeed, so strong is my faith in its efficacy, that I will send TWO BOTTLES FREE, together with a VALUABLE TREATISE on this disease, to any sufferer. Give Express & P. O. address. DR. T. A. BREEDER AND SPORTSMAN

Vol. II. No. 8.
NO 508 MONTGOMERY STREET.

SAN FRANCISCO, SATURDAY, FEBRUARY 24, 1883.

SUBSCRIPTION
FIVE DOLLARS A YEAR.

WHEATLEY. Owned by J. B. Chase, San Francisco.

Again we present one of the high-bred division, feeling confident that our readers will agree with us that he is highly formed, too. It may appear like a tiresome repetition to call attention to the pictures which are presented in the BREEDER AND SPORTSMAN as being artistic delineations as well as faithful representations of the animals portrayed, and to those who are acqnainted with the horses given the likeness is apparent. It is also supererogatory to call attention to the handling and finish of the pictures, as that is also evident to those who are competent judges. Again, the portrayal gives such a vivid idea of the form that it is scarcely necessary to supplement the "counterfeit presentiment" with words further than to give the size and color, the proportions being so accurately represented. Wheatley is a handsome shade of chestnut with the white markings as given above. He is nearly 16 hands high and of fine substance, with bone and tendon enough to suit those who consider these as being prime essentials in the make-up of a good horse. As the picture demonstrates, he is a highly finished horse, carrying the evidence of speed and endurance in his form. That this is a rightful inheritance will be admitted when his genealogical tree is examined, and the combination of blood such as to insure these qualities following in the lines of descent.

As an illustration of that derived from his sire the following article is copied from the New York *Spirit of the Times*, being one of the series of "Winning Sires," which have been so well handled in that paper:

War Dance is one of the few sons of Lexington who has so far held his own among the winning sires as to retain a place of prominence. Last season he stood well in the front, and in writing his memoir we went into the details of his early history so fully, that to do so now would be a work of stale repetition. We will, therefore, merely state that he was bred in 1860, by Gen. T. J. Wells of Louisiana, who named him Gen. Westmore, as a compliment to the gentleman by that name, whose pleasing contributions, a score of years since, often graced the *Spirit's* pages over the *nom de guerre* of "Mark." The late Mr. A. Keene Richards saw War Dance, early in his three-year-old form, and was so impressed with the colt that he purchased him for $5,000. At the time of the purchase Gen. Wells had tried the colt, and he made trials equal to any run by Lecompte, or any of Reel's progeny, but the great war between the States was devastating the South at the time, and racing had been completely abandoned. Hence, War Dance languished for a chance to prove his powers in public. It was about this time that Stark[illegible] the Goodwood Cup, and Mr. Richards had almost d[illegible] mined to send War Dance over the ocean in quest[illegible]

when the approach of the Federal armies obliged them to seek a place of safety for the stock, rather than attempt running the blockade, as they would have to do to get to England.

Accordingly, War Dance was sent into Texas. It was nearly a year after hostilities had ceased before War Dance emerged from his exile, and then, owing to efforts of J. Madison Wells, the provisional Governor of Louisiana, who, being a brother of General Wells, who died just at the close of the war, and knowing Mr. Richards to be a warm personal friend of his brother, had the horse brought to New Orleans, and begged that Mr. Richards would come South at once and claim his property. Mr. Richards arrived at New Orleans early in the spring of 1866, and found his horse in the hands of General Westmore and Governor Wells, both of whom, in their belief in his great racing powers, had entered him for a three-mile dash at the Crescent Course. The horse had been leading a life of idleness in Texas, and upon his arrival, had been taken up and hastily trained, and the result was that when he went to the post it was with a bad leg. Still trained, and on the verge of a break-down, his prospects were not flattering, but it was agreed that, by making a waiting race, and doing all their running in the last quarter, they might bring him through, and, as a forlorn hope, he was started, only to disappoint his over-sanguine backers, who bet rashly and lost heavily. The summary is given below:

NEW ORLEANS, April 17, 1866.—Purse $600; dash of three miles.
S. D. Henderson's b c Gen. Rosseau, 4 years, by Commodore—Nota Price..... 1
J. M. Relf's ch h War Dance, 6 years, by Lexington—Reel..... dis
Time—6:41.

The *Spirit* of that date gives the following account:

Rosseau was at first the favorite, but toward the last War Dance was backed at even money. But it was on account of his blood. He was not in condition, and, besides, "had a leg." The colt had the inside and led off at a slow pace throughout the first mile. Yet even that was more than his opponent could stand. The latter was unable to act on the heavy ground, and the attempt tore him all to pieces. Gen. Rosseau won in a canter by thirty lengths, never having been headed or extended.

War Dance was taken at once to Kentucky, and entered the stud a couple of weeks afterwards. His grand appearance and his blood, Lexington, the king of racers, crossed upon Reel, the ex-queen of the turf and mother of Lexington's great rival, Lecompte, brought him plenty of patronage. Below is a table showing the performances of his sons and daughters upon the turf during the past few years:

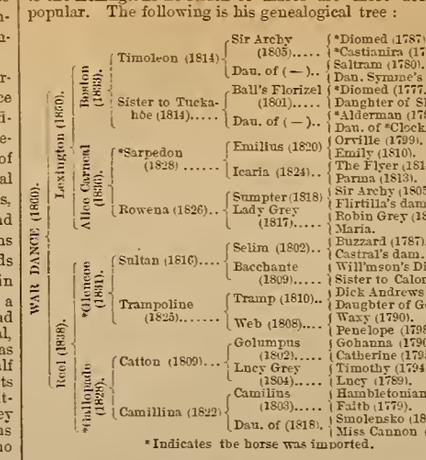
Year.	Starters.	Races.	1st.	2d.	3d.	Unplaced.	Amount.
1877.....	20	140	37	37	19	47	$15,140 00
1878.....	40	198	45	26	20	107	15,635 00
1879.....	41	249	56	49	40	145	29,912 00
1880.....	40	272	64	53	41	144	24,366 00
1881.....	38	352	84	72	44	152	43,544 75
1882.....	35	347	56	71	56	164	42,925 00

Lida Grissom was one of the first of the get of War Dance, but she made no figure on the turf. In his second season, however, he got from the imported mare Lass of Sydney that capital horse, Tubman, who, in the opinion of many, was the best of the family. When he stripped for the Belmont Stakes of 1871 he was sixteen hands high, as leggy and as awkward a one as we can remember; and, though after he had exchanged the "silver gray stripes" of Mr. Richards for the McDaniel blue he filled out, yet the legginess never quite left him, and he was a greyhound-looking horse to the last. He galloped low-headed, but the critics predicted that he would fail at a distance, because of his tendency to overstride. He refuted this by winning the Bowie Stakes in the mud, and has become quite a favorite stallion among the Canadians. Aureola, who was another of the second lot War Dance gave the turf, was a mare of insignificant appearance, but of the finest vital power, and her two-mile heats were the best on record for a long time. Bullion was another of the noted children of War Dance, and John McClellan says he was the best race horse he ever saw, and, as leading stallion at the Minnehaha Stud, has made the most of the limited chances offered him, his son, Fairfield, being one of the best two-year-olds out last season.

War Dance's lot in the above table is hardly as creditable to him as last year's, when he had Sly Dance and Warfield as prominent winners and Wyoming as one of the leading two-year-olds of the season. Yet he has advanced several points in the list of winning sires. This is due to the system of basing the merit of a stallion upon the sum of money won by his get. Red Boy heads the list, from the fact of his having won a $10,000 match at Salt Lake City. But Ella Warfield's position was attained by real up-hill fighting. This little mare has been run in first-class company the greater part of the past season, and she has certainly made a very creditable showing. Many who saw the Bowie Stakes run aver that she certainly would have beaten Bushwbacker had not her owner, Mr. Hall, made the fatal mistake of shouting to Shauer to go on early in the second heat. The little mare is, unlike her brother Warfield, a great sticker over a distance, but Warfield, as will be seen by the list, maintains a name for usefulness, having won just half his races. Sisterly, like Red Boy, owes her prominence to one of those heavy matches which the sportsmen of the far West delight in. Wyoming has never been himself since the Jerome Park meeting, when he was knocked down, and sustained an injury to his shoulder, which troubled him so badly at Sheepshead Bay, in the fall, that he could not be removed from the grounds. Sachem's races were in England, where he ran third for the Derby, but was unable to place his name in the magic basket of winners. In our judgment, he is still what he was while here—a vastly overrated colt, and he has proved a dear one to Mr. Lorillard.

B. G. Bruce of Lexington, Ky., who knew him well, describes him as a rich golden chestnut, standing a shade over sixteen hands, with a large star, and four white feet, the white extending some six inches above his pasterns. He had a good head and an extremely stout neck, running into well-placed shoulders, with a large middle piece, short back, and ribs most remarkable, stout loin, broad hips and quarters, and immense stifles. The only defect was a slight cutting in below the knee, but this he did not seem to impart to his stock, who, uniformly, have plenty of bone, with sound feet and legs.

Mr. Keene Richards died early in 1881, and War Dance passed into the hands of Mr. Grinstead. He followed his old master closely, and died April 27, 1881, aged twenty-one years. War Dance was a loss, for though he never got a Harry Bassett or a Longfellow, a Sensation or a Hindoo, he succeeded in getting a most useful tribe. His son Bullion promises to keep up his male line, and his daughters are very fashionable broodmares. Eole, Danger, Lelex, Aureolus and Frankie B, all owe their birth to War Dance mares, and next to the Lexingtons no strain of mares are more deservedly popular. The following is his genealogical tree:



*Indicates the horse was imported.

But in the above the dam of War Dance does not figure with the prominence her performances and the merits of her progeny entitle her to. She was, without question, entitled to rank as one of the great mares of the country and by some of the writers of the time when she was on the turf held to be the equal of any for speed and endurance, and however distinguished on the course, she certainly added a still greater luster to her fame in the stud. Lecompte, Prioress, Starke, gained such a high reputation in this country that they were taken to England, Lecompte dying soon after his arrival, Prioress and Starke winning important races and the former being designated by Admiral Rous as the best race-horse for a long distance in England. Lecompte is the only horse which ever beat Lexington and the only defeats he met in this country were by Lexington, and, in a race which will be hereafter given, by Pryor. Wm. J. Minor claimed with all the emphasis he could find language to express, that he was the superior, and though that view undoubtedly came from being so identified with Lecompte in his races, he is certainly entitled to be placed a close second to the Emperor.

As the dam of Wheatley was a sister to Pryor, the account of the race in which he defeated the Southern crack will come in appropriately. The description is from the New Orleans *Picayune*, the race having been run at Natchez, Mississippi:

The race which took place at Natchez on Saturday last, four-mile heats, between Pryor and Lecomte, was, I think, almost equal to any I ever witnessed, stamping both of the contending nags as first-rate horses, and proving conclusively to my mind that Lecompte is a gamer and better horse than I had previously given him credit for. The difficulties which he encountered in the prosecution of his tedious land journey from Alexandria to Natchez could not have been instrumental in improving his condition, which, however, to appearance was all that could be desired. His eye was clear and bright, as was his skin, and his proud defiant air, and elastic step, betokened ability to go the pace, and keep it. In his exercise, which I particularly noticed the day before the race, I was much pleased with the style in which he came down the quarter stretch. He looked as if he could fairly fly. He had no superfluous flesh upon him, and in short, upon stripping for the race, he looked the perfection of a horse.

Of Pryor but little was known, and therefore little was expected. Twice had he met Mr. Kenner's filly Minnow, and in both instances he was compelled to yield the palm of superiority to her powers—the latter race of two-mile heats was the longest distance he had ever ran. In his race with Le Roi, three days previously, he had developed extraordinary fleetness, and the purity of his blood, and the general excellence of his form, gave promise of endurance which lured his trainer to the desperate chance of attacking even so formidable a rival as the renowned Lecompte, of 7.26 memory. A better bred or more gallant steed ne'er struck the ground than Pryor, and in this contest well and nobly has he sustained the exalted reputation that his ancestors, on the maternal side, years long gone by, established upon the American turf by their glorious achievements.

The Pharsalia Course, at best a slow one, according to estimates of those who, for many years, have trained and run horses upon it, was not less than from twelve to fifteen seconds slower than in its best condition, and yet the time made upon this occasion, if I have not been misinformed, was better than any ever before made upon the course. This speaks trumpet-tongued, and fully explains the superiority of the contestants, and the excellence of their condition.

There was but little betting at the commencement of the race—100 to 15 in some instances—100 to 20 for a while current—more hundreds than twenties on Lecompte.

The lack of changes or variety in the race precludes the necessity of a very lengthy description. It was evident, from the start, that the instructions to Pryor's rider were, "wait and win," and he fulfilled them to the letter, and rode the race throughout in a style that would have given credit to Gil. Patrick.

Pryor went off with the lead, but resigned it to Lecompte at the commencement of the backstretch, and took position about three lengths in his rear. These positions were but slightly changed during three and a half miles; the pace, however, visibly increased in the second and third miles. On the fourth mile they were running at tell-tale stroke. Just after passing the half-mile post, Pryor made play, and, by a terrific burst of speed, passed his competitor like a dart, amidst the most unearthly and deafening shouts I ever heard. The run home was at a rapid flight, and for a while exciting; Lecompte, however, could not reach his wiry antagonist, who came to the stand about a clear length in the lead. The time of the fourth mile, 1:52! of the heat, 7:47.

The problem of Pryor's ability to go another four miles was not yet solved to the satisfaction of his friends, and at the pace which it was certain Lecompte would carry him the next heat, they well knew he had to be a trump. He looked, however, as if he could go to Salisbury, N. C., and his appearance and behavior, before starting for the second heat, inspired fresh confidence in his friends, who backed him heavily at even, to win.

Lecompte was evidently not a little the worse for wear. When he stopped, he "blew out" strong and heartily, but a short time before starting again he had a quick "sheep blow," which plainly indicated that he was tired, and his conduct during the remainder of the race impelled me to the conviction which I have expressed at the commencement of this report. Throughout the whole race, gallantly and faithfully did he respond to each call made upon him—but in vain; it was too evident that he was overmatched.

The second heat was almost a repetition of the first, save that it was faster, which, under the circumstances, astonished all who witnessed it. Lecompte was determined to "do or die." Pryor equally determined to allow him to regulate the pace, until it suited his rider to take the lead. Very nearly at the same spot as in the first heat he made a terrific dash, and gave him the go-by at a sort of telegraphic speed, and came in, I am constrained to say, an easy winner. About that time, and for several minutes afterward, it would have been somewhat difficult to "hear anything drop." The time of the heat, 7:44½.

SUMMARY.

Saturday March 15—Association Purse, $300, for all ages. Four mile-heats.

A. L. Bingaman's (R. Ten Broeck's) cb c Pryor, pedigree above, 3 years.....	1	1
Thos. J. Wells' ch h Lecompte, by Boston, out of Reel, 5 years....	2	2

FIRST HEAT.		SECOND HEAT.	
Time of first mile.....	2:00	Time of first mile.....	1:56
Time of second mile.....	1:57	Time of second mile.....	1:56
Time of third mile.....	1:58	Time of third mile.....	1:58
Time of fourth mile.....	1:52	Time of fourth mile.....	1:54
Time of first heat.....	7:47	Time of second heat.....	7:44½

Track heavy.

The following description of Pryor is copied from Frank Forester's "Horses of America," and the picture alluded to is a fine steel engraving of a horse that has a good deal of resemblance to Wheatley. There is also a strong resemblance to the sire of Pryor, Glencoe, and as Wheatley gets another strain through Reel, this doubling of the blood of the "lusty Newmarket stallion" is a valuable acquisition.

Of this horse, concerning whom there has always prevailed something of mystery, as of Lecompte, I have been able to find no published description. The fine portrait which accompanies this memoir, exquisitely engraved by Mr. Hinshelwood, from an original picture in the possession of his owner, Mr. Ten Broeck, and lent, by his courtesy, for this work, is said to be an excellent likeness.

Its peculiar characteristic is the extreme length of the neck and forehand, and the light spiry cut of the animal generally; yet we are told, by those who have seen and known him, that he is rather a pony-built and close-ribbed-up horse than otherwise, which certainly does not appear from the portrait in question. His color is a somewhat dull chestnut. There has been some dispute about his age, but I can state on authority that it is clearly authenticated that he is only in his fourth year.

It is certainly within our province to write that the blood which gained such high renown, now nearly thirty years ago, and which has gained additional glory since, cannot fail to give merit to the scion who inherits it. Farther than this the collateral branches are of the same sterling sort as following pedigree proves:

Wheatley, by War Dance.

First dam sister to Pryor, by imported Glencoe.
Second dam Gipsy, full sister to Medoc, by American Eclipse.
Third dam Young Maid of the Oaks, by imported Expedition.
Fourth dam Maid of the Oaks, by imported Spread Eagle.
Fifth dam Annette, by imported Sbark.
Sixth dam by Rockingbam.
Seventh dam by Baylor's Gallant.
Eighth dam by True Whig.
Ninth dam by imported Regulus.
Tenth dam imported Duchess.
Eleventh dam Grisewood's Lady Thigh by Croft's Partner.
Twelfth dam by Greybound.
Thirteenth dam Sophonisba's dam, by Curwen Bay Barb.
Fourteenth dam D'Arcy's chestnut Arabian.
Fifteenth dam by Whiteshirt.
Sixteenth dam Montague Mare.

The get of Medoc swept everything before them when they came upon the track, and though he was killed by a falling tree when a comparatively young horse, his sons and daughters played a prominent part in the racecourses of Kentucky and Tennessee. He has been termed the best son of American Eclipse, and with good grounds to base the

She was certainly a very promising filly and in her races at Petaluma in 1881, when she beat Tillie C, Night Hawk and Carmelita 1½ miles in 2:46½, and a race of heats of a mile in 1:47½, 1:52, and won so easily, this was no measure of her speed. On a half-mile track this was a good performance, and insures the get of Wheatley from good mares being "sure-enough" racehorses.

Latonia Jockey Club.

The partial conflict between the new Latonia Jockey Club, of Covington, Ky., and Cincinnati, O., and the St. Louis Jockey Club did not very materially affect the entries for the Latonia stakes, which closed on the 1st. All the prominent Western stables are represented at the June meeting with the exception of that of Mr. R. Pate, of St. Louis, who it will be remembered bought the Milton Young Stable, but even his stable is represented at the autumn meeting. The full entry is as follows:

FOR THE JUNE MEETING.

Harold Stakes, two-year-olds; five furlongs	56
Clipsetta Stakes, two-year-old fillies; five furlongs	46
Sensation Stakes, two-year-olds; six furlongs	44
Hindoo Stakes, three-year-olds; mile and a half	27
Glidelia Stakes, three-year-old fillies; mile and a quarter	26
Ripple Stakes, maiden three-year-olds; mile and a quarter	50
Himyar Stakes, three-year-olds; mile and five furlongs	34
Merchants' Stakes, all ages; mile and a furlong	44
Hotel Stakes, all ages; mile and a quarter	45
Total	372

FOR THE AUTUMN MEETING.

Kimball Stakes, two-year-olds; six furlongs	46
Zoo-Zoo Stakes, two-year-old fillies; six furlongs	43
Barrett Stakes, two-year-olds; one mile	50
Springbok Stakes, three-year-olds; mile and five furlongs	36
Falsetto Stakes, three-year-olds; two miles	34
Total	209

The all-aged stakes for the autumn meeting will not be announced until August. But the three-year-old stakes for 1884 obtained the following entry: Hindoo, 56; Glidelia, 38; Himyar, 49; Springbok, 47, and the Falsetto, 45, a total of 235, which is an excellent showing for the second year of a new organization.

THE STABLE.

Closing of Stakes.

Do not forget that the stakes aud purses of the Pacific Coast Blood Horse Association close on Thursday, March 1. See advertisement.

Introduction to "Tips and Toe-Weights."

I present this little volume with apologies, requesting the forbearance of my readers for the want of connection, and in many cases repetitions, which are due to the desnltory manner the work has been done. This is iu a great measuie owing to awaiting the results of experiments and taking up the snbject after the lapse of long intervals. As the experiments progressed parts were written and published, and then there would arise qnestions which necessitated further delays. At oue time I thought of rewriting the whole work, which wonld have afforded the opportnnity to correct the lack of continuity, and then I thonght it hetter to present it as it was, thns giving the stages as they occurred. The first chapter was pnhlished in April, 1876, and nearly eight years have been occnpied in experimenting, and thongh confined to a small nnmher of horses, the extension over so long a period has made the trials equivalent to a larger number of cases for a shorter time. In fact, the experiments could not have been carried out in a less space than three years, as iu the case of Anteeo, a colt was taken as a subject from the first time of shoeing, when 13½ old, months uutil nearly four years of age. By taking an animal as yonng as Anteeo, and coutinning the nse of tips nntil so nearly matnred, the test was thorough as to the effect on the feet aud legs. Previons to that the differences hetween full shoes and tips were tried, the bearing on the relative trotting-speed being the object, and the results in every case were in favor of tips, so that if it was fnrther proven that the theory cf following nature as closely as possible was the proper procedure to keep the feet and legs in the best shape, the advantages of the system could not be overrated. While offering excuses for the fanlts allnded to, I present with the utmost confidence my views, with confirmed belief that the system recommended is altogether the most rational method of horse-shoeing, and when the advantages are realized it will supersede that which for centnries has been known to be fanlty.

I do not claim novelty in the nse of tips or "lnnette" shoes. They are of comparatively ancient origin. Bnt I do claim that the manner of placing them on the feet in a great measure nnllified the benefits. The plan of cutting a shoulder for the posterior portion of the tip to rest against, and thus giving the bottom of the foot a level and natnral bearing, was nnknown to me until I discovered it in the way which is told, and I have yet to meet a blacksmith who was acqnainted with the plan nntil I made it puhlic. The letters which are copied from the London *Field* were pnblished five years after it was pnt in type here; and therefore I can claim priority of them. Simple as it is, I believe it to be the corner stone of the system. When the tip is "feathered" it either has to be set with so much incline on the foot snrface as to make a strain on the wall, or the toe is raised so much higher than it shonld be that the proper bearing is destroyed. The sqnare shoulder is also an advantage in keeping the tip in the proper place when the nails are driven, bnt it makes the work of fitting much more troublesome. This is one of the reasons why blacksmiths are so averse to the setting of tips, thongh their greatest antipathy arises from the nearly nniversal determination to stick to the old ruts. Until this is overcome it will he difficult for owners to get their horses shod satisfactorily nnless nnder their personal snpervision, though eventnally there will be some of the most enterprising smiths to lead the way, and others will be compelled to follow. That this difficnlty will be obviated I feel confident, and in every town of any size there will be one smith who has sense enongh to discover that his interests will be promoted by laboriug on the side of rcform. Until lately I was nnder the impression that shoeing-smiths wonld have to be educated to a higher degree, and another generation at the forge and on the floor before the work wonld he properly done.

I was led to this belief from the trouble there was in getting the tips made properly, and then a ten times more arduons task was to get them correctly put on. In my first experiments I made patterns of wood and had them cast by a brass-fonnder, and had there been an opportunity of getting some better metal cast in the monlds, such as steel or even malleable iron, I shonld have adhered to the plan, but the brass wore away so rapidly that I had to change, and I was fortunate in obtaining a smith who would forge them very nearly in accordance with the patterns furnished. Latterly I have fonnd a blacksmith who is as enthusiastic in his advocacy of the nse of tips as I am, who has put them ou all kinds of horses, including those nsed for heavy draft, and with satisfactory results in all cases.

This is Paul Friedhoffer, bnt as his sbops are in San Francisco, the only relief to me was in being enabled to get the tips made as I wanted them, the setting having to be done by myself, as the trouble of sendiug horses from Oakland offset the labor. And by the way it is donbtful if I could have contiuued the seven years' war, if nnable to prepare the foot and nail the tips on myself. In that case I would have been compelled to enperintend the job from the start to the finish, and this would have entailed the loss of more time. By doing it myself I was also enabled to see the exact state of the foot, and make changes that were found beneficial. Though the practice has made me more expert in the use of knife, rasp, and file, and given me an aptitnde to drive a nail where I want it to go, it is a hot job and one that leaves a soreness of muscle which is not pleasant. Sustained, however, by the implicit faith that I was working in a good canse, that the nltimate result would bring amelioration to the animals I have been so intimately connected with for more than a qnarter of a century, I have never flinched from the self-imposed task, and for the last three or four years never lost confidence. I have listened patieutly to the arguments offered by the opponents of tips, watched closely for defects in the system which the reasoning on the other side was to disclose, and which at first I thought might overturn my previous conclusions, but every succeeding year has added strength to my convictions, aud given me renewed courage to adhere. Many years ago I had to select a motto to go on the records of a society and the one chosen was "Haud fast." I have held tenacionsly to the belief in the efficacy of thoroughbred blood in the trotter for fully twenty-five years, and now the granddaughter of a thoroughbred mare occnpies the highest place in the record with others of the same degree of consanguinity to the royal blood close up in the calendar.

After these seven years' experieuce with tips the grip has grown firmer, tightening with every snccessive trial, practice so fully demonstrating the correctness of the theory that nature is a correct tutor, that I hold fast as confideutly as in the other illnstration. In order to do so it was fortunate that I had a few horses of my own to experiment with, and though forced to offer apologies for making them so conspicuous it was compulsory that the prominence shonld be given. Had there been others interested it is not likely that the tests wonld have been made so thorongh. It is probable that a want of harmony wonld have prevailed and a difference of opinion interfered.

That there has been fair snccess in the way of trotting speed I think is evident. The only colts I have trained iu California to trot have been five of my own breeding. Three of these were foaled East, two here. Four of them have shown trials better than 2:40 wheu three and fonr years old, the other trotted in 3:02 when a yearling; with the exception of the yearliug the fastest work was done in tips, the exception heing harefooted.

The point has been raised that trotting the yearling barefooted was an admission on my part of a want of confidence in the system advocated. The reasons for trotting him barefooted are giveu in his history, though this is unnecessary to show the absurdity of the charge.

As light tips set in the manner described is the nearest approach to leaving the foot bare, it is manifest to the simplest understanding that the henefits of one will be shared by the other. There is so nearly the same "spring" in the foot when the tip does not extend farther back than the point of the frog that this valnahle property is retained, aud the frog-pressnre identical.

The appendix, I am sorry to state, is not what I anticipated to make it. Toe-weights are certainly an intricate study, or it may be better to write that the effects of weight on the foot, especially on the outer part of it, though known to he potent, the causes as yet are nnexplained. At least such is my case and I mnst acknowledge an ignorance which is an estoppel against any attempt to elucidate. Through the kindness of ex-Governor Stanford, however, I am enabled to give some valuable information regardiug the action of the race horse and trotter, and with his consent present representations of the most prominent featnres of the "horse in motion." Very unfortunately the copy of the work edited hy Dr. Stillman which was sent me by Governor Stanford miscarried, and never having seen a copy I have been without the information I hoped to make use of. The first cards that were pnblished and a series of views arranged for the zoetrope, which were sent me by Mr. Mnybridge, have given au insight of the greatest valne, and, in fact, have taught me the only true knowledge I possess on the action of the race horse. Before these instantaneous photographs were taken, the manner in which a race horse progressed was as completely hidden as though the gallop had never heen seen, and even the short explanation will be found of the greatest service if attention is paid to the subject. Still, though it is as plain as the "writing on the wall," that a change in part of the present system of training is imperative. The pioneer who realizes the importance of benefiting from the lessons that the camera places before him has an arduous task, and the methods he employs to turu to a practical nse the teachings of the Palo Alto school will excite no eud of ridicule and badinage.

The time will surely come, notwithstanding the jokes and jeers, and there will be progress in this as well as other things. When that time comes Governor Stanford will receive the thanks he has so richly earned, and the immense expenditure that was necessary to make the work complete bring a return commensurate with the outlay. Not to the donor, as his reward will be restricted to the satisfaction of having made men wieer, and the still more satisfactory knowledge that the wisdom gainod has ameliorated the condition of the horse.

It may be considered out of place, in these hrief introductory remarks, to allude to a work of such magnitudo as the photographing of animale in motion, the importanco of the subject demanding a far more extonded elucidation. Still I cannot let tho opportnnity escape of refcrence, howcver brief, or pass hy without proper acknowledgment of the assistance obtained from a study of the photographs. Although I had a fair kuowledge of the actiou of the fast trotter, I was as totally ignorant of that of the racehorse as if I had never seen one gallop. Even the three cnts which are given in the first chapter of the appendix prove that former ideas of the manner in which a horse ran wero as erroneous as could be and portions of the stride are fully as grotesque as the representations given. A comparison of the cuts of parts of the racing and trotting stride will show the great difference there is in the two gaits, and even the short essay accompanying them will be found of some service. At all events they show how much greater the strain is on the foreleg of the racehorse irrespective of the weight on his back, and the contrast between "the last effort" and "the initial" sufficient to account for an ailing foreleg being so much worse for the racehorse than the trotter.

The appendix is not as full as I thought it would be when the opening chapters were writteu, nearly two years ago. Then I fancied that I had obtained a clew which would lead to satisfactory explanations of the canse for weight applied on the outside of the foot exerting such a potent influence on the fast-trotting action. The more study I gave it the more pnzzling it hecame, and at present can only state that I am not capable of giving reasons which are at all satisfactory to myself, and conjectures wonld not be worth the space given or the time of the readers. It may be that future experiments and closer ohservation will lead to the discovery of a key, or it is qnite as likely that some trivial circumstance will prove the guide to escape from the labyrinth, and chance, as it has done heretofore, lead to the correct solution of the problem. Awaiting developments I can only offer the excuses given, and trust that the apology will be accepted.

Before concluding, I mnst again refer to the want of connection and repetitions, and the necessity for bearing in mind that the pnblication of the varions chapters was broken by long delays. Even the title page was printed two years ago, and the chapters in the following order: From Chapter 1st to 7th, inclusive, April, 1876, to 1878; then from that time nntil 1881 there were occasional pnblications, and the remainder within the last few months.

I cannot say good by, however, without reiterating my implicit belief in the efficacy of tips, and in contradistinction from the toe-weight puzzle there are reasons, plain and palpable, why the result of practice should be as I have fonnd it.

Jos. Cairn Simpson.

San Francisco, February, 1883.

The Pacing Element.

It is not so many years ago, rather less than half a decade, in fact, that the influence of pacing strains in the pedigrees of trotters began to receive the serions attention of men who make breeding the suhject of careful and intelligent study. The old notion was that pacers were quitters, and this cry, started by some one who had never taken the pains or perhaps had not the hrains to investigate the subject in an impartial manner, was taken up by a lot of other foolish and unthinking persons, nntil by sheer force of repetition the saying, "quits like a pacer," became a popular and common one. Those who were so eager to cry down the pacers were apparently blind to the fact that for years the 2:17½ wagon record of that grand old mare, Pocahontas, was far and away the best performance of its kind ever made by a trotter or pacer, and that it stood nnapproached nntil Hopefnl lowered it to 2:16½ over the Chicago track four years ago last summer. And they also forget, or will not see, that with the single exception of the little white horse from Maine no animal has ever approached the record made so many years ago by the chestnut mare whose descendants are still trotting and pacing and siring trotters and pacers.

The fact that nntil within a very recent period pacing races were confined exclusively to the smaller class of meetings, had, no doubt, mnch to do with keeping the side-wheelers from showing the really good work of which they were capable. But when the associations in the Central Circuit made the free-for-all pacing race a feature of the programmes, fast and game pacers began to be plenty. Sleepy Tom, a descendant, hy the way, of Pocahontas, bliud though he was and driven by a raw conntry youth, over whom the more experienced knights of the ribbons had an incalcnable advantage, soon showed the people that all pacers were not quitters. He weut a mile over the Chicago track in 2:12¼, and right on his wheel at the finish was the six-year-old mare Mattie Hunter. It was not loug before Lucy reeled off a mile iu 2:14, and the rubicund face of Uncle Sam Keyes, her owner and driver, was wreathed in smiles for many a day after the important event. Rowdy Boy was another that could go fast; these four making the celebrated quartet that for three seasons held their own against all opponents. Then came Little Brown Jug, who pacod three heats over tho Hartford track, in 1881, in 2:11¾, 2:11¾, 2:12½—the fastest three consecutive heats ever trotted or paced, the total time of the three miles being one and three-quarters seconds faster than the best three consecutive heats on record by a trotter, those of Maud S at Philadelphia the same season. This would seem to settle beyond a doubt the question of whether a pacer can put in his heats at as high rate of speed as the trotter; but in order to settle the question of endurance beyond a doubt, let the two-mile record be examined. Ten years ago last fall, at Sacramento, Cal., Defiance and Longfellow pacod a dead heat of two miles in 4:47¾, which beat the then best record by a trotter at that distance very considerably, and the mark made by theso pacers, neither of whom would be considerod first-class at the present day, stood for ten years unequalod, until Monroe Chief went two miles in 4:46 at Lexington last fall. With these facts beforo him, who can say that the pacers are not game, and that to their blood, that flows in tho veins of so many of our crack trottors, Maud S among the rest, is not due a measure of the gameness, as well as the speed, that characterizee tho American trotter?—*Breeder's Gazette.*

Probably the oldest trotting horse in this country is the black gelding General Butler, who has a record of 2:21½, mado at the old Fashion Course in 1862. He was then ton years old, and consequently is now in his thirty-first year. Ho has been campaigued from Maiue to Chicago, and he was contemporaneous with such horses as Ethan Allen, Georgo M. Patcheu, Lucy, Priucese aud Dexter. The horse is still looking well and is enjoying a well-earned rest at Westchester, New York.

THE STAGE.

The Theatrical Outlook.

The lenten season has had its usual influence on theatrical affairs and it is doubtful if any establishment, except the minstrels, has more than covered its expenses during the past week. And yet, if some good and novel attraction had been offered, there is no doubt but that it would have drawn admirably well. It is unfortunate for San Francisco that our managers all appear to be intent on securing stars and combinations of superior character at about the same period, so that we either have a surfeit or are put on short commons in the way of our amusements. It is not likely that we shall have any great attractions here until about Easter, as it is about then that the regular season at the East comes to an end, and California possesses unrivaled charms for all the histrionic notabilities to pass a pleasant summer on the coast and at the same time to secure a well-lined purse from our indulgent public. Thus we are promised in quick succession such attractions as Mrs. Langtry, Dion Boucicault, the Wyndham company, as also the Union Square and the Wallack combinations, and a mass of other dramatic and musical attractions that will render theatrical affairs very lively during the summer, especially as the city will be filled with visitors attending the conclave of the Knights Templar. They will all meet with ample patronage, but were one or two of the engagements to come off now the receipts would be much larger without such competition.

The California.

Leonard Grover, judging from his works, is not a dramatic genius, but he has a facility of sketching out character parts that were they more elaborated and brought together in a taking plot, would secure a lasting success. His new venture "The City" that was produced last Tuesday at this theater is a drama that is replete with suggestive ideas of original delineations connected with a plot formed on such a trite and hackneyed subject as the theft of some bonds and the discovery of a lost child. The play is interesting under a certain point of view, but the dialogue is far too diffusive and the action drags, probably owing to the necessities of the scenic effects that are on a very great scale. As it is now, the play appears to have been patched together in order to bring in certain eccentric characters and to give ample opportunities to the stage carpenters and scenic artists and certainly the picture of the Niagara Falls and New York ferry boat have seldom been surpassed on a stage that has been celebrated for its spectacular effects. The company is quite equal to the requirements of the drama, and some of the artists developed a talent in eccentric characters that was deserving of applause. The principal parts were taken by George Holland (who was wonderfully good in a succession of diagsis), W. Thompson, Leonard Grover Jr., George Osbourne, Miss Constance Murielle, Mrs. Fredericks and Miss Amelia Waugh, and they were all given in an efficient manner. "The City" will probably remain on the boards for another week and will be succeeded by "The Red Pocketbook," a well-worn melodrama of the old school, rejuvenated for the occasion under the combined efforts of Ben Teal and Dave Belasco.

The Baldwin.

The pretty domestic drama of "Young Mrs. Winthrop" continues to do excellent business and improves greatly now that all the artists have become thoroughly acquainted with each other's methods, which is the great desideratum for an even and effective performance. This play appeals strongly to womanly sympathy without a recourse to those meretricious effects by which some of the best French productions are marred, even when presented under the most favorable circumstances. "Young Mrs. Winthrop" ought to command at least a four-weeks run to good business.

The Bush Street Theater.

Miss Minnie Palmer in "My Sweetheart" brings her engagement to a close to-day and to-morrow evening and on Monday we shall witness the return of the "Rice Surprise Party," who, if we may judge from the wonderful success they have already achieved, will play another very profitable season. It is a pity that these popular artists have not another piece in their repertoire, so as to give a variety to their performances, but we are promised a series of new songs and acts that will give a zest to their excellent entertainment.

The Standard.

Judging from the attendance the programme at the Minstrels will need but little change during the next week, showing, as it does, the talent and versatility of the artists to very good advantage. There is one complaint, however, that the many friends of Emerson are apt now to make, and that is, they see far too little of the manager after whom the cosy little theater is named. To add to the popularity of the establishment, it is generally understood that a visit to the Minstrels does not encroach on Lenten regulations.

The Tivoli.

Donizetti's delightful opera of "Linda di Chamouni" will be presented next week, with Miss Ethel Lynton in the title role, and this work will also serve to re-introduce to the scenes of their former successes those favorites artists, Miss Hattie Moore and Harry Gates. Under such circumstances, "Linda" is sure to meet with a generous reception.

Dramatic Notes.

Salmi Morse has again failed to obtain a license to produce his "Passion Play" in New York, and it really appears as if all his year's labor and expenditure would prove to be in vain. There seems to exist a misapprehension at the East as to the conditions on which it was presented in this city. On its initial production the subject created but scant attention from the press, but the opposition grew immensely on its revival, and on the threat of arresting all the principal participants in the sacred drama as well as the author, the idea was forcibly abandoned and Salmi Morse had to seek a new field for his sacred drama.

Dion Boucicault has made a great hit at Boston in his new drama, "The Amadan," which will shortly be produced at Wallack's old theater in New York, that is now happily named the Manhattan.

John T. Raymond has scored another failure in his new piece, "In Paradise," that is thus called probably because the scene is mostly laid in Chicago. In this connection we may congratulate ourselves on the result as it will probably cause that self-sufficient star to dispense with his usual annual visit to these shores.

The one-night opening of the Grand Opera House on last Monday shows again how futile it is to enlist public patronage with a wretched drama, still more wretchedly put upon the stage, as was the case with "Through Fire."

Mrs. Perzel, usually known as Maria Prescott, is about to make another attempt at starring, and this time in conjunction with Oscar Wilde's play of "Vera." It would be much more pleasant to hear that the first production would take place in England, where both the author and artiste are better appreciated than in this country.

James O'Neill is trying to play Edmond Dante in "Monte Christo," at Booth's Theater, New York, but is scarcely up to the requirements of a part that made Fechter famous as the romantic actor of his day. Harry Lee, Gerald Eyre and Miss Katherine Rogers are included in the cast, and the piece is mounted in the most brilliant and effective manner. Hence its success.

ATHLETICS.

The Merions' Field Day.

The First Annual Field Day of the Merion Cricket Club, at the Recreation Grounds on Washington's Birthday, was a most gratifying success. An excellent programme of events had been prepared by a competent committee, and the rapid manner in which they followed until the list was exhausted, was one of the most pleasing features in connection with the meeting. A large of spectators was present, the ladies taking an unusual interest in the sport.

The track, which was laid in front of the grand stand, running across the grounds, was favorable to good time, barring the fact that it was a trifle hard. The handicaps were quite liberal, and the events well contested. Considerable new talent was brought out prominently, especially so in the case of Ben. Benjamin, who, though comparatively unknown among local sprinters showed both speed and style. The creditable manner in which he acquitted himself in the other events, such as jumping and walking, gave evidence that he possessed latent ability as a general athlete.

The meeting was a most pleasant reunion of athletic clubs, and a few more such field days would do much to bring the sport into popularity. The officers of the day were as follows:

Referee, Andrew Forman Jr., C. C. Judges—R. S. Haley, O. A. C.; A. H. Hogg, C. A. and L. C.; W. J. O'Connor, G. G. A. C.; Aug. Waterman, O. C. C.; R. J. Callingham, C. L. B. C. Timers—P. McIntyre, O. A. C.; Joseph Masterson, C. A. and L. C.; C. B. Hill, M. C. C. Starter—J. Sanderson, O. C. C.

The results of the various events are as follows, only first and second being recorded:

Club race, 100 yards, for members M. C. C., won by Gaston M. Ashe, Charles Creighton second; time, 11¼ seconds.

Throwing cricket ball, for cricketers only, won by Aug. Waterman, O. C. C.; distance, 80 yards, 10 inches.

Grammar school race, 100 yards, won by Barney Benjamin, M. C. C., R. Young second; time, 11 4-5 seconds.

One-hundred-yard race, handicap, open, won by C. Creighton, M. C. C.; nine yards; second, A. L. Harris, four yards; time, 10⅘ seconds. Second heat won by G. M. Ashe, M. C. C., nine yards; second, Barney Benjamin, M. C. C., twelve yards; time, 10 2-5 seconds. The third heat resulted in a tie between R. B. Jones, M. C. C. four yards, and H. Raynes, B. G. A. C., ten yards; time, 11 seconds.

One mile walk, open, won by J. B. Benjamin, M. C. C. second, J. H. Spiro. Time 8:08.

Running wide jump, won by Ben Benjamin; distance 15 feet, 4 inches.

One hundred yards handicap, final heat won by Barney Benjamin; 12 yards; second, G. M. Ashe, 9 yards. Time 10 2-5 seconds.

Running high jump, open, won by W. C. Brown, O. A. C.; distance 5 feet, 3½ inches.

One mile bicycle race, open, won by Edwin Morhig, S. F. B. C., 105 yards; second, H. Tenney, O. B. C., 95 yards. Time 3:19½.

Kicking football, open, won by M. Peterson, 156½ feet.

Four hundred and forty yards handicap, open, won by G. M. Ashe, M. M. C., 36 yards; second, R. S. Haley, scratch. Time, 2:24.

Standing wide jump, M. C. C, members, won by F. L. Mathiew; distance, 10 ft, 2 inches.

One hundred yard race, students Boys' High School, won by A. V. Booth; second, S. Chipman. Time, 11 seconds.

One mile handicap, open, won by Jos. T. Gorevan, G. G. A. C.; second, W. A. Beatty, U. A. C. Time, 5:06½.

The legislative correspondents of the San Francisco papers have devised quite a popular way of wiling away the tedium incident to reporting. Under the leadership of Tom Flynn, they have organized a boxing club, and by dint of hard knocks dealt by the acquatic hero, the neophytes are fast improving.

The California Athletic and Lacrosse Club is early in the field for what promises to be a good year. They are endeavoring to make arrangements to secure a suitable ground for their lacrosse games. The grounds formerly occupied by the Mechanic's Institute are said to be their choice.

John C. Quinn, First Lieutenant of the S. F. Bicycle Club, and a party consisting of Walter Kelly, Wm. Day and Ernest Rideout, had a moonlight run to the Park last Monday evening.

A meeting of the California Athletic and Lacrosse Club will be held on Wednesday evening at License Collector McNeil's office.

Unattached wheelmen are requested to send their names and addresses to Geo. J. Hobe, Secretary of the S. F. B. C.

The Golden Gate Athletic Club will give an exhibition at the gymnasium on March 29.

Hon. I. S. Case of Racine, Wis., is widely known as the largest manufacturer of agricultural machinery in the United States; also extensively engaged in breeding the highly bred and formed trotting horse; but few, however, are aware of the extent of his stock interests. He is joint owner of over 60,000 acres of the best grazing land in Texas; has upon it over 25,000 sheep and over 20,000 head of cattle. The cattle interest has been profitable of late. On an investment of $45,000 in cattle within two years he has been offered $105,000 profit.

Closing of Stakes.

Do not forget that the stakes and purses of the Pacific Coast Blood Horse Association close on Thursday, March 1. See advertisement.

The Countryman.

There is not, perhaps, a more interesting feature of the trotting turf than the gentleman who, once in every year of his toilsome and non-eventful life, throws care to the winds and resolves solemnly to have a good time with himself at the "hoss race." In many sections of the country the sporting tastes of the ruralist are sufficiently gratified by the exhibitions in the speed ring at the county fair, but in cases where his home is contiguous to one of the great trotting centers this will not suffice—he must see "the big races"—and he does, oftentimes, alas! to his great financial loss and consequent depression of spirits.

The countryman, at a big trotting meeting, moves in a world of his own. He views the passing panorama of human life and actions with eyes that look upon everything from the standpoint of honesty and inexperience. Once in the city where the meeting is being held—his arrival generally occurring at an early hour in the morning—he wanders aimlessly about the streets, busily engaged in his favorite pastime of gazing with a far-off look into the store windows and stepping on the feet of about 40 per cent. of the people who may have occasion to travel the sidewalk of which he has taken possession.

About noon he begins inquiring of some passer-by concerning the location of the racetrack, and an hour or so later finds him in front of the ticket-seller's window near the main entrance to the grounds. Having discovered by practical experience that the man who sells tickets has but one price for his wares, and that no amount of argument will induce him to alter the schedule of admission fees which the association has established, the bucolic visitor enters and begins a tour of investigation. Generally the first thing which attracts his attention is a wheel of fortune. Having watched for some moments the crowd surrounding the machine, he edges his way to the table and puts a quarter on the red or the black. After losing a few dollars, and wondering, b' gosh, how it is that the paddle never stops in a red number when his money is on the red, and how, with singular malignity of purpose, it always avoids the black numbers when black is his color, the countryman leaves the game in disgust. About this time it occurs to him that a little lunch would not be amiss, and he forthwith secures two doughnuts for five cents and a bottle of red pop for the same amount of currency. Having surrendered his digestive organs to the tender mercies of these delicacies, he sets sail, like Columbus of old, in search of whatever may turn up. Generally his next move is in the direction of the stables where the trotters are quartered. Reaching there, he halts in front of some box stall over which the name of a distinguished trotter appears, and proceeds to enlighten himself concerning the animal. The conversation with the man in charge of the place is about as follows:

"That St. Julien?"
"Yes."
"Nice hoss, ain't he?"
"Yes."
"Trot to-day?"
"No."
"When?"
"Day after to-morrow."
"Be you his owner?"
"No."
"Driver, hey?"
"No."
"Kick?"
"No."
"Pooty fast, hey?"
"Yes."
"Faster'n Rarus?"
"Yes."
"Wuth much?"
"Forty thousand dollars."
"Gosh!"—and the countryman wanders on, to repeat his inquiries at the next stall.

At Toledo, in 1877, when the Tri-State fair was in progress, the crowd present on the day that Goldsmith Maid was advertised to trot was somewhere about 40,000. Thirty-nine thousand of these were countrymen, and every last one of them wanted to see the famous old mare. A couple of bright stable boys saw in this fact a chance to make an honest dollar, and soon evolved a scheme which they proceeded at once to put into operation. Going to the stall of the black mare, Iowa Maid, they changed the "Iowa" part of the sign over the door to "Goldsmith," and then caused the report to be circulated that the famous trotter was on exhibition, and could be seen for twenty-five cents. They were not long in getting custom, and soon there was a long string of excited grangers in front of the door, all anxious to part with their money. Before the deception was discovered, the cute stable boys had taken in about $20, which was liberal payment enough for their time and trouble.

And so the countryman at the races sees new and startling sights every year, enjoys himself hugely, and goes home none the worse, except in pocket, for his experience among the trotters.—*Breeder's Gazette.*

Northern Notes.

The board of Trustees of the Walla Walla Agricultural Society are endeavoring to purchase the Driving Park, and to that end are collecting subscriptions. The price is $10,000, to be taken in 50 shares of $200 each. Over twenty citizens have already subscribed, and there is no doubt but that it will be an easy matter to obtain the remainder.

Barley and oats command 2½ and 3 cents in Grande Ronde valley, Oregon. The latter is the retail price. This is the highest price that has ruled in that valley for a good many years.

Four years ago Wm. Wyatt of Philomath, bought 400 angora goats. He has sold his remaining flock, 294, because the coyotes took more than their share.

Joseph Buchtel will give a race meeting of five days over the City View Driving Park, Portland, commencing the 2d of July.

The Dayton *Journal* reports that the cold weather last week had bad effect on cattle, and many were dying.

A 2,000-pound steer was butchered at Walla Walla last week.

Stock in Garfield county have suffered from cold weather.

Sheep are said to be dying by scores beyond Snake river.

YACHTING.

Hipping Yachts.

As a very prominent example of the effect of more beam on a yacht the following from an article in the New York *Spirit of the Times* may be cited:

The Poillons built the schooner Sappho on speculation, and, failing to find a customer for her here, she was sent to Europe, raced there, and was badly beaten. On her return she was purchased by Mr. William P. Douglass, and Captain Fish's advice was sought as to what alterations were necessary to make her a fast yacht. He prescribed his usual panacea, "more beam." The modern school would have chorused, "more lead." Captain Fish's advice was adopted, and the schooner was hipped out fourteen inches, if our memory serves, on either side. Whether as a result of this or not we don't pretend to say, and in truth have always had our doubts about the matter, but as a matter of fact, the Sappho obtained on both sides of the Atlantic the title of "invincible," and was admitted by all to be the fastest schooner in the world. Her builder always contended that her defeat in British waters was due to the inexperience of her captain in yacht racing, and we have not the least doubt that, had Captain "Bob" Fish been at the wheel during this first race in England a different result would have been recorded.

There was quite an animated newspaper controversy as to the effect of the "hipping," while the work was being performed, the advocates of beam contending that the increased sail-carrying power would more than offset the increased resistance, and Mr. Poillon and his backers asserting that nothing would be gained by the proposed hipping, the increased resistance being more than an equivalent for any increase of power that would be gained. Whichever side was correct; whether, under proper handling, the Sappho would have proved as speedy in her old form as she undoubtedly did prove after the alteration was made, can, of course, never be known; that she did prove exceptionally fast after the alteration is matter of history, and the credit must be given to Captain Fish, who would undoubtedly have had to bear the odium had the schooner proved a failure.

One of the plans proposed at the meeting of yachtsmen which was held at the Palace Hotel last week, to consider a means of enlivening yachting matters, was this: That different cruises be arranged, which shall be in charge of different individuals. Let the Commodore start off the first of the season with the usual trip to the usual place. Then let the next cruise, for instance, be the Nellie's. Let the owner of that yacht select the place of rendezvous, the hour of start, the hour of return and all the details. Let the responsibility of the affair rest on him. This will give all the yacht owners a chance to command and give them an opportunity to introduce some new features into the sport. The old traditional sail to Vallejo is getting somewhat stale. Some shorter trips might be enjoyed and some trips taken with which the ladies would be pleased. The idea is, that instead of one man arranging affairs all the season, the responsibility be divided up and all hands take their turn. Each one will be desirous of having his special trip successful, and when he is fleet-captain will want all the others to turn out to swell his fleet. He will not, therefore, refuse to go with the others for fear they will refuse to go with him. It is not probable that with this plan we shall see a "fleet" of two yachts starting off on a club cruise, as has been the case in this bay somewhat too often. It is high time a change in this direction should be made. At all events it will not be much trouble to try the plan.

The San Francisco Yacht Club is considering the advisability of hiring a yacht for the use of the non-yacht-owners of the club. It is proposed to have a yacht start at a certain hour every Saturday afternoon for the special use of these gentlemen and their friends, a sailing master to be in charge. It is thought by some that this plan will induce more persons to join the club and make more interest in club affairs.

The two center-board yachts Nellie and Chispa, which are acknowledged to be both speedy and weatherly, are likely to open the eyes of some of the people who think that nothing but a keel boat can be a "wind-jammer." Those moderate bilges, sharp bows and heavy iron center-boards are hard to beat going to windward.

A trial trip of the new yacht Lurline belonging to the Spreckels brothers was made on Sunday last. The yacht was found to be rather lightly ballasted but otherwise the trial was in every way successful. The yacht is said to have shown remarkable speed, which was to be expected, however, from one of Capt. Turner's models.

In a few weeks all the yacht owners will be at work getting ready for the opening of the season, which takes place the first week in April. With the six or seven new yachts which will be added to the list we ought to have a lively season in San Francisco bay.

There ought to be a fine race made to the Farallones next season between the new keel yachts and Commodore Macdonough's smart yacht Aggie. They are pretty well of a size.

There is again talk of the yacht harbor and the San Francisco Yacht Club has appointed a committee to stir the matter up and see if something definite cannot be done.

Captain Turner, the well-known yacht builder, was thrown from his buggy last week and sustained some severe bruises.

Work is going on steadily with Mr. Tevis' yacht, and it will not be long before she will begin to look like a boat.

The annual election of the San Francisco Yacht Club comes off on the first Tuesday in April.

The yacht clubs have very few, if any, small yachts belonging to them now.

The new plunger Fannie will be sent up to Carquinez straits next week.

A party of young gentlemen have engaged the Thetis for the next season.

The Clara, the handsome little craft in the bay, is to be sold.

The Bessie will hereafter be kept up in Suisun bay.

The Lolita will be down from the marshes soon.

The *East Oregonian* says: "Butchers of Pendleton have been paying from $55 to $75 per head for beef cattle and as high as $5 per head for sheep."

Times-Mountaineer, The Dalles, says: Reports from the country are to the effect that stock is becoming very thin.

THE KENNEL.

Modesto Coursers.

The members of the newly organized Stanislaus Coursing Club had a very successful run last week near Modesto on J. J. Murphy's ranch. H. C. Gordon acted as judge and George Martin as slipper. The result of the match was as follows:

W. B. Newman's r b Lady Gray beat V. B. Dale's b b Queen.

B. Bailey's bl d Swift beat B. B. Garner's r and w d Calico.

J. Finnigan's b b Black Bess beat T. Carmichael's r d Bounce.

W. Harp's bl b Patsey beat W. Stone's bl d Inspector.

W. Stone's r d Dallas beat W. Harp's bl d Inspector.

Ties:

Lady beat Swift.

Black Bess beat Patsey.

Dallas ran a bye.

Final heats:

Lady beat Bess.

This gave first money to Lady; second money to Bess; Dallas being beaten by B. B. Garner's Calico fell out and third money was given to Swift.

Sale of Chicopee.

In our advertising columns will be found a notice from Mr. Dougherty signifying his intention to dispose of his well-known greyhound dog Chicopee. This dog was originally run by Tom Tunstead who always claimed that the wall-eyed pup, as Chicopee was commonly called, could beat any dog in this State. After some ill luck Chicopee scored a win in the twenty-four dog stake run by the Pioneer Club at Merced, the year before last.

In the fall of the year the Pioneer Club run off their match at Ross Sargent's ranch near Stockton, and again Chicopee proved the winner. The circumstances of that match will never be forgotten by any man who was on the ground. It rained nearly all the morning and the ground was so wet that the hares could not run a little bit. "No course" after "no course" was given until every one was heartily tired of the ill luck. Three times did Chicopee kill in the second ties without ever another point being made and finally secured the tie by a smart turn and the kill. The third and final ties were almost as unfortunate and Chicopee only wrested the first prize from Sam Jones, a son of Gentleman Jones, by sheer endurance. Chicopee's last win was at Dixon, where he defeated a very fair field of dogs in fine style. He has been trained some for the spring meetings and the gentleman who gets him will have but little trouble to put on the finishing touches. As the best living representative of old White Cloud, Chicopee is a valuable animal for crossing with the Cartwright or Speculation stock.

Eastern Field Trials Club.—The Derby of 1883, given by the Eastern Field Trials Club, will be for a purse of $500, the winner taking $250, second $150, and the third $100. It is open to all pointers and setters whelped on and after January 1, 1882, and entries close on July 1, 1883. The forfeit is $5 each entry and $10 additional for starters. Entries must be addressed to Wash. A. Coster, Box 30, Flatbush, L. I. Mr. Coster is now in Virginia, the object of his trip being to select grounds and make arrangements with the owners for the preservation of the quail for the use of the club.

Benicia Coursers.—A few days since a coursing match between Dublin Dan, a dog owned in Benicia and Suisun Lily, a dog owned by James Barrett of Suisun, was run off on the place known as the Corcoran Ranch. The match partook of quite a sectional character and small bets were freely made by the respective partisans. The Lily of Suisun won the match and now Mr. Barrett is willing to match her against any dog in Benicia for a reasonable stake.

The Coming Match.—Next Tuesday the coursing match between Devlin's Chief of the Canyon and Carroll's Monarch will be run at Byron station. The principals will leave San Francisco on the 9:30 boat, arriving at Byron at 12 m., and returning to San Francisco the day following at 11:45. There is good hotel accommodation at Byron.

Mr. J. H. Brock of Oroville has sent his Laverack-Llewellin bitch May, by Aldrich's McGregor out of Judge Gale's celebrated pure Laverack bitch, for training for the next Gilroy field trials.

Mr. H. S. Rudisill of Riverside has purchased Juno, Belton-Belle, a field trial winner at Gilroy, from E. Leavesley.

A coursing match was run off at Petaluma last Sunday, in which Lady Franklin carried off first prize.

TURF AND TRACK.

A Dismal Prospect for the Oregon Runners.

This is the season when the high mettled racer, in his long winter coat of hair that turns up like fish hooks, stands in his box stall and muches his rations of bran, hay and carrots, and runs out for a couple of hours at noon to play in the little narrow lot beside his stable. His bridle is at hand for the boy uses it to lead him out; but his saddle is laid away till March, and his rider's silken clothes are tucked away in an old gripsack. At night he lies in his bed of dry straw, to dream over the summer days when his coat glistened like polished rosewood and the bell sounded a signal for saddling up; when the field within the track was crowded with elegant equipages filled with beautiful women and stalwart men; and when there came the fall of the flag, the scramble for the inside track, the hard pull for the brush on the homestretch, the final rally under whip and spur, and the shouts of exultation that hailed him as a winner. All these visions fleet through his mind as he reposes after the battle, gathering new stamina in his anatomy and new fiber in his muscle for the coming contests of the summer that lurks beneath the snow, as the roses slumber in the earth's bosom. In a few weeks more the willow buds will turn yellow, and the wild fowl plume their wings for the northern flight; and then the high-mettled racer will be shod for his spring exercise and commence his gallops on the turf. In Oregon we fear it will be a slack season, unless unusual inducements are offered. The moneyed men, who could help the thing if they would, all prefer trotting races because they see an occasional chance to utilize their own driving nags; and the poor men, the men whose half-dollars make up the sum total of the gate money, prefer running horses and running races. If anybody doubts this let him inspect the books of the pool sellers for the past five years. The scarcity of running horses owned in this State forbids the belief that there will be many contests, nor does the history of last year's racing give color to the belief that very many of them will be run on the square, or in such a manner that those who lose their money will be able to say that they had a chance to win. The brigade of "terribly high bred cattle" that have done service in years past, are about ready to go into obscurity. Patsy Duffy is kept as a breeding stallion at Baker City, and Red Boy is at Sacramento, hopelessly broken down. Fred Collier and Joe Howell will be taken East in March to roll the ball at Louisville, and thence onward to Jerome Park and Long Branch, as Mr. Ayers, their owner, says there is more real money to be won in one race at these places than can be won in an entire season of campaigning in Oregon. He is more than half right, and if his horses are good enough to win there, he will prove it. Trade Dollar has been a great mare in her day, but she has been on the turf already a year too long, and lost that great turn of speed which distinguished her from all other horses of her time. She will probably be added to the long list of valuable broodmares during the coming season, as will that always vastly overrated mare, Caddie R. Orduance, in consideration of having won a heavy-betting race at Baker City last fall, may be kept on the turf another year; but she is small, and we doubt her ability to put up her weight and carry it to the front. Jim Merritt was never anything but a mile horse, and even that seemed too far for him in good company. Poor, honest, old Connor, with his bald face and white legs, will never hear the drum tap again; and his half-brother, Winters, fully as game but never so speedy, has been permanently added to the list of breeding sires. This narrows the list down to John Young's colt, Bank Roll, four years, by Dr. Lindsay, out of Rosa Mansfield; R. E. Bybee's b f Neyella, by California, out of Laura Barnes; Foster Bros.' Lady Foster, which is not likely to come here again; and the Idaho colt, Billy Coombs, which is reported to have gone out of training with a queer leg. The old flyers have trained off and there are no new ones to fill the vacant place. The big sorrel gelding, Jim Renwick, owned by Ayers & Knott, has been brought back to Gregon. This horse was considered short and flashy last summer, but his race with Euchre at Oakland proved that he could live a mile and a quarter if in good condition.—*Portland Oregonian.*

The Stockton Stake.

We have received the following more particular statement of the nominations for the Stockton Stake for two-year-olds. Two new names, Nighthawk and Dawn, appear on the list, and the addition of sires and dams gives a clearer idea of the possibilities of the race.

John Mackey, Sacramento, g c Alcazar, by Poscora Hayward—A. Rose.

L. M. Morse, Lodi, b f Ida, by Abbotsford—Winthrop Girl.

Jos. Cairn Simpson, Oakland, br c Antevolo, by Electioneer—Columbine by A. W. Richmond.

J. T. McIntosh, Chico, b f Sallie M, by Prompter—Sallie Russell by Blackbird.

G. W. Traheru, Stockton, b c Voucher, by Nephew—by Vernou Patchen.

G. W. Trahern, Stockton, b f Bracelet, by Nephew—by Messenger Duroc.

A. A. Yeager, Vallejo, b f Nona Y, by Admiral—Black Flora.

J. A. McCloud, Stockton, b c Mount Vernon, by Nutwood—Daisy by Chieftain.

L. J. Rose, San Gabriel, b s Bedouin, by Sultan—Gertrude by The Moor.

L. J. Rose, San Gabriel, ch f ——, by Del Sur—by The Moor.

J. E. Dunham, Pacheco, ch c Oscar Steinway, by Steinway—Frankie Eaton by Whipple's Hambletonian.

Palo Alto Stock Farm, b f Argo, by Electioneer—American Girl by Toronto Soutag.

Palo Alto Stock Farm, b c Gypsnm, by Electioneer—Gypsy by Abdallah.

Palo Alto Stock Farm, b f Chiqnita, by Electioneer—Pearl by George Lancaster.

Palo Alto Stock Farm, b c Edos, by General Benton—Sontag Mohawk by Mohawk Chief.

Palo Alto Stock Farm, b c Alban, by General Benton—Lady Morgan by Rysdyk's Hambletonian.

D. E. Knight, Marysville, ch f Nighthawk, by Brigadier—Nellie.

Charles Sherman, Chico, c Chevalier, by Brigadier—Kit by Billy McCracken.

J. B. Tennent, Pinole, ch c Pinole Jr., by Pinole Patchen—Lola, by Pilot Jr.

E. Giddings, Lemoore, b c Bay Rose, by Sultan—by The Moor.

J. P. Burns, Pinole, br c Alert, by Atherton—by Pinole Patchen.

F. L. Smith, Sacramento, b f Cora, by Buccaneer—Pearl by Blue Bull.

A. L. Frost, Sacramento, b c Roscoe, by Brigadier—Flora F.

Sargent Bros., Woodbridge, g c ——, by Priam—Gilroy Belle.

Charles David, San Francisco, W. O. Hatch's c Mambrino Belmont, by Carr's Mambrino—by Stockbridge Chief.

L. U. Shippee, Stockton, ch f Sister to Honesty, by Priam—by Chieftain.

L. U. Shippee, Stockton ch c ——, by Nutwood—by Chieftain.

Wm. Beach, Petaluma, ch c Dawn, by Nutwood—Countess by Whipple's Hambletonian.

Kennedy & Story announce a spring meeting over the Los Angeles Park track to commence Thursday, April 5, and end Tuesday, April 10, good day and track. The following is the programme:

First day, Thursday—Free for all, trotting, three minute class. Purse, $100. Free for all, running, half mile and repeat. Purse, $100.

Second day, Friday—Free for all, trotting, for 2:45 class. Purse, $150. Free for all, running, one mile dash. Purse, $150.

Third day, Saturday—Free for all, running, half mile dash for two-year-olds. Purse, $100. Free for all, one mile and repeat. Purse, $150.

Fourth day, Monday—Free for all, trotting, for 2:30 class. Purse, $200. Free for all, running, three-quarter mile dash for three-year-olds. Purse, $100.

Fifth day, Tuesday—Free for all, running, two mile dash. Purse, $100. Fifty mile race, arrangements for which are not yet fully perfected.

Other races to be arranged. All trotting races 3 in 5. First and second money in all races except fifty mile race, two-thirds to first and one-third to second horse. No owner allowed to enter two horses in the same race.

Entries close at the park, March 26, 1883.

The Story of Slow Go.

Slow Go, a horse whose record of 2:18½ would make his death a matter of interest to the general public, even had he no other claim to consideration, died a few days ago in Pittsburg, and the news of his demise brings to mind some incidents of his turf career that may not prove uninteresting.

Slow Go, who was a steel-colored roan gelding, was foaled in 1870, his sire being Young Sharatack and his dam a plain-looking bay mare of unknown breeding. With his earlier experiences on the turf this article will not treat, as they comprised nothing of particular interest. It was in 1876 that the big roan gelding first came prominently before the public, and his debut into the realm of notoriety was attended with circumstances of a very painful nature to a considerable number of people, inasmuch as his success was obtained at the expense, to people who despised his prowess, of a very considerable sum of money. J. H. Pettit had the horse that season—the solemn old man with snowy white hair and mustache who has for so many seasons followed the fortunes of Turner's stable, and acted as first assistant to that driver. Slow Go had trotted a number of races in and about Philadelphia, where he had been wintered, without much success, and his fortunes did not improve materially when the battles of the Grand Circuit were entered upon. At the Poughkeepsie meeting the class in which Slow Go was entered filled well, and when the day of the race arrived Sensation, Adelaide, Joe Brown, Slow Go, Blanche and Idol responded to the starting judge's bell—a formidable field, indeed. Sensation was owned by A. W. Richmond, and that gentleman and his friends, of whom he had a host, were there prepared to back the little Etban Allen gelding as long as anybody could be found to buy the field against him. The betting went on in this way for a while, and then Adelaide began to be noticed in the pool selling, the others not receiving any particular attention. The truth was that Dan De Noyelles, who owned Adelaide, thought it a sure thing for his mare to win, and as the tip was quietly circulated among his party, they made haste to put up their money on the little daughter of Phil Sheridan, knowing her to be fast and a laster. When the betting became split up a little the friends of the other horses took heart and began backing their favorites a little. Slow Go had few friends, and about $5 in pools of $200 and over was all the auctioneer could get for him.

Finally the race began. The first heat was a dead one, in 2:26½, but in the second Slow Go astonished the crowd by winning quite handily in 2:25½, and so easily did he do the work that the backers of Sensation (this is how the story goes) concluded that it would be well to have a conversation with Pettit before proceeding further with the business of the day. The interview was held, and its results were apparently satisfactory, for Sensation won the third and fourth heats in 2:25¾, 2:24½. Then the Adelaide party, who had been laying up the little mare in order to let the others fight themselves out, concluded it was time they had a finger in the pie, and in the fifth heat the mare was first to the wire in 2:28. Sensation had not acted very well in this heat, as the time showed, and his backers were not scared. But when Adelaide came back the sixth heat in 2:24¾, the horizon of their hopes began to assume a very lurid hue. Fortunately (as they thought) darkness came on at this juncture, and the race was postponed until the next day. In the meantime (as rumor had always asserted) the Sensation people were called upon to again consult the driver of Slow Go, that party having thrown out dark insinuations to the effect that the horse acted like he wanted to run away on a trot, and that the labor of keeping him from the performance of so disastrous a feat was certainly worthy of liberal remuneration. They settled again, and waited anxiously for the morning. When it came all the horses were in good shape, but Slow Go seemed unusually fast. The word for the seventh heat was given, and when the backers of Sensation saw, ere half a mile had been trotted, that he had Adelaide beaten, their hopes rose, and it looked to them as if the race was all over except the shouting. But just then it was noticed that Slow Go, who had not yet been seen in front, was improving his position very rapidly, and the hearts of the Sensation men went into their throats as the roan went flying past their favorite, and won the heat easily in 2:24½.

Another council of war was held at once, and (report says) Pettit was settled with for the third and last time. But in spite of that Slow Go won the eighth and last heat of the race in 2:25½, and there was mourning in the camp.
